1. General Considerations

General Information: Unless otherwise noted, all chemicals were purchased and used without further purification. ^1H NMR and ^{13}C NMR spectra were recorded at ambient temperature on a 400 MHz NMR spectrometer (101 MHz for ^{13}C). NMR experiments are reported in δ units, parts per million (ppm). The coupling constants J are given in Hz. Column chromatography was performed using EM Silica gel 60 (300-400 mesh). HRMS were recorded on a TOF LC/MS equipped with electrospray ionization (ESI) probe operating in positive ion mode. Emission intensities were recorded using a FS5 spectrophotometer. Cyclic voltammetry was performed on the CHI-660E electrochemical workstation (Shanghai Chenhua Instrument Co., Ltd., China).

2. General Synthetic Procedures

All substrates are known compounds. Glycine derivatives **1a-1s** were synthesized according to the literature.¹ *N*-aryl tetrahydroisoquinolines **4a-4u** were prepared according to the literature.² Photocatalyst 3CzClIPN was synthesized according to the literature.³

Typical procedure for photo-induced direct α -C(sp³)–H pyridination of N-arylamines with 4-cyanopyridine:

The mixture of *N,N*-dimethyl-2-(phenylamino)acetamide **1a** (0.24 mmol, 42.7 mg), **2a** (0.2 mmol, 20.8 mg), 3CzClIPN (2 mol%, 0.004 mmol, 2.6 mg) and DMF (2 mL) was added to a Schlenk tube. The tube was evacuated and backfilled with nitrogen (repeated five times). The reaction mixture was irradiated with 6W blue LEDs at ambient temperature for 16 h. Then, the reaction mixture was diluted with ethyl acetate (20 mL) and washed with sat. NaHCO₃ (10 mL) and brine (10 mL). After drying over sodium sulfate, the solvent was evaporated under reduced pressure, and the residue was purified by silica gel flash column chromatography (eluent: petroleum ether/ethyl acetate =1/1) to obtain the product **3aa** (81%, 41.3 mg). The photoreactor is shown in Figure S1.

3.2 Stern–Volmer luminescence-quenching experiments

Fluorescence quenching experiments were measured on an Agilent Cary Eclipse Spectrophotometer. The excitation wavelength of 3CzCLIPN was fixed at 340 nm with emission spectrum $\lambda_{\text{max}} = 560$ nm. The emission spectrum of a 3×10^{-5} M solution of 3CzCLIPN in DMF was collected.

2a: A stock solution of **2a** (0.01 M) was prepared. The emission intensity of 3CzCLIPN (3×10^{-5} M in DMF) was collected with the gradient concentration of **2a** and the results were presented.

3.3 Cyclic voltammetry study

Cyclic voltammetric investigations were performed on the ChenhuaCHI400C electrochemical workstation with the conventional three-electrode system. The measurements were conducted in 0.1 M tetrabutylammonium hexafluorophosphate (TBAPF₆) in CH₃CN. The solutions were kept under positive pressure of nitrogen. Cyclic voltammetry (CV) with the following settings: Scan Rates = 0.1 V/s, Sweep Segments = 10, Sample Interval = 0.001 V, Quiet Time = 2 sec. CV recording is

based on the traditional IUPAC (positive anode current and negative cathode current).

Supporting electrolyte: TBAPF₆ was purchased from Energy Chemical and used without further purification. The concentration of electrolyte is 0.1 M.

Solvent: Anhydrous CH₃CN was purchased from Energy Chemical and exhausted via a nitrogen blast for 1 h before using.

Electrodes: The working electrode is a glassy carbon electrode ($\Phi 3$ mm, 7×10^{-6} cm²). It was first polished with sandpaper in steps (3000 mesh–2000 mesh–1000 mesh); then with 1.0 μ m, 0.3 μ m, and 0.05 μ m alumina powder until the surface of the electrode is mirror-like, then, the electrodes are washed with distilled water and acetone before air drying. Saturated calomel electrode (SCE) was used as the reference electrode. Pt column ($\Phi 1$ mm x 5 mm) was used as the counter electrode.
