Figure S1 Partial pressure profile of reactant A p_A as function of distance *x*. Pressure decreases linearly before the transition point x_t is reached (Eq. 18). Linearly extrapolated pressure becomes zero at x_s . Beyond the transition point, when $x > x_t$, an approximation is used as in Eqs. 20 and 21. In this illustration, x_p is the penetration depth at half surface coverage. Reproduced from the supplementary figure (Fig. S1) of Yim *et al.*¹, Creative Commons Attribution 3.0 Unported Licence.

S1 Varying exposure series

S1.1 Total exposure calculation

Calculated values of the total exposure for pressures varying from 10^{-2} to 10^4 Pa with a constant exposure time of 0.1 s are in table S1. Exposure was varied within 10^{-3} to 10^3 Pa·s.

Reactant partial pressure p_{A0}	Exposure time t	Total exposure	Total exposure
Pa	S	Pa·s	Langmuir
10 ⁻²	10^{-1}	10 ⁻³	7.5×10^{0}
10^{-1}	10^{-1}	10^{-2}	$7.5 imes 10^1$
10^{0}	10^{-1}	10^{-1}	$7.5 imes 10^2$
10^{1}	10^{-1}	100	$7.5 imes 10^{3}$
10^{2}	10^{-1}	101	$7.5 imes 10^4$
10 ³	10^{-1}	10 ²	$7.5 imes 10^{5}$
104	10^{-1}	10 ³	$7.5 imes 10^3$

Table S1 Exposures calculated for the varying exposure series

S1.2 Estimation of the total exposure to saturate the surface at LHAR channel entrance

Total exposure expected to saturate the surface at the entrance of the LHAR structure was calculated from the Gordon et al. model² (Eq. 7: $Pt = S\sqrt{2\pi mk_{\rm B}T}$; *S* corresponds to *q* in this work). Dividing the result at 250°C with the sticking coefficient *c* of 0.01 gave 0.029 Pa·s (~ 220 L) as the expected total exposure for saturation.

Simulation results presented in the main article (Fig. 3a-h) show that for the cases with p_{A0} 10^{-2} , 10^{-1} , and 10^{0} Pa, complete surface coverage was not yet seen at the entrance of the LHAR channel. Thus, the corresponding total exposures (10^{-3} , 10^{-2} , 10^{-1} Pa·s, ~ 7.5, 75, 750 L respectively) were insufficient to saturate the surface. The case with p_{A0} of 10^{0} Pa had total exposure of 10^{-1} Pa·s (~ 750 L), which is higher than the exposure expected to be required for full surface coverage at the channel entrance calculated with the Gordon et al.² method. The reason for the higher total exposure required for saturation in the simulations as compared to the calculated value remains unclear.

S2 Constant exposure series

S2.1 Total exposure calculation

Calculated values of the total exposure for pressures varying from 10^{-2} to 10^4 Pa and exposure time varying from 10^{-3} to 10^3 s are in table S2. Exposure was 10 Pa·s in all cases.

Table S2 Reactant partial pressure and exposure time calculated for the constant exposure series
--

Reactant partial pressure p_{A0}	Exposure time t	Total exposure	Total exposure
Pa	S	Pa·s	Langmuir
10 ⁻²	10 ³	10	7.5×10^{4}
10^{-1}	10^{2}	10	$7.5 imes 10^4$
10^{0}	10^{1}	10	$7.5 imes 10^4$
10^{1}	10^{0}	10	$7.5 imes 10^4$
10^{2}	10^{-1}	10	$7.5 imes 10^4$
10 ³	10^{-2}	10	$7.5 imes 10^4$
104	10^{-3}	10	$7.5 imes 10^4$

S3 Supplementary information presented for both the constant and varying

exposure series

Figure S2 Diffusion coefficients (m² s⁻¹) as a function of the *Kn* number, for different reactant partial pressure p_{A0} : (a) molecular diffusion coefficient D_A , (b) Knudsen diffusion coefficient D_{Kn} , and (c) effective diffusion coefficient D_{eff} . Hollow symbols represent a 500 nm channel height and correspond to the PillarHallTM case.³

Figure S3 Diffusion coefficients (m² s⁻¹) as a function of the channel height *H*, for different reactant partial pressure p_{A0} : (a) molecular diffusion coefficient D_A , (b) Knudsen diffusion coefficient D_{Kn} , and (c) effective diffusion coefficient D_{eff} . Hollow symbols represent a 500 nm channel height and correspond to the PillarHallTM case.³

Figure S4 Diffusion coefficients $(m^2 s^{-1})$ as a function of: (a) reactant pressure p_{A0} , with a constant *H* of 100 µm, and (b) channel height *H*, with a constant p_{A0} of 10^2 Pa. Hollow symbols are for the PillarHallTM case³ with a 500 nm channel height.

	0.286	48.864	0.502

Table S5 Penetration depth and absolute values of the slope at half coverage for the summary table (Table 2) of the main article. The values are for trends reported in the continuum regime ($Kn \ll 1$).

Simulation parameter	Varied values	$\tilde{x}_{\theta=0.5}$	$\left\ \frac{d\theta}{d\tilde{x}} \right\ _{\tilde{x}=0.5}$
	0.05	46.416	0.455
	0.1	34.433	0.518
Molecular mass of the ALD reactant M_A (kgmol ⁻¹)	0.15	28.621	0.565
	0.2	25.014	0.603
	0.25	22.497	0.635
	0.004	22.327	0.813
	0.012	28.825	0.625
Molecular mass of the carrier gas M_I (kgmol ⁻¹)	0.02	32.179	0.557
	0.028	34.432	0.518
	0.036	36.105	0.493
	4	43.005	0.420
	5	38.245	0.468
Molecular mass of the ALD reactant M_A (kgmol ⁻¹) Molecular mass of the carrier gas M_I (kgmol ⁻¹) Size of the reactant molecule d_A (m) Density of the grown material ρ (kgm ⁻³)	6	34.431	0.516
	7	31.308	0.568
	8	28.704	0.614
	2000	34.433	0.518
	2500	34.433	0.518
Density of the grown material ρ (kgm ⁻³)	3000	34.432	0.518
	3500	34.432	0.518
	4000	34.433	0.518

Figure S9 Saturation profiles with increasing the desorption probability P_d in the continuum flow regime used in the summary table of the main article (Table 2). This figure also includes additional saturation profiles for higher P_d values ($P_d \ge 10$).

Figure S10 Saturation profiles for increasing the diameter of the inert carrier gas $d_{\rm I}$ related to the summary table in the main article (Table 2). The saturation profiles are for different flow regimes: (a) free molecular flow regime (b) transition flow regime and the (c) continuum flow regime.

Figure S11 Diffusion coefficients (m^2s^{-1}) corresponding to the temperature *T* variation cases in the summary Table 2 of the main article. Diffusion coefficients are plotted as a function of *T* (K): (a) molecular diffusion coefficient D_A , (b) Knudsen diffusion coefficient D_{Kn} , and (c) effective diffusion coefficient D_{eff} .
