

## Supporting Information

### Computational insights into the binding modes, keto-enol tautomerization and stereo-electronically controlled decarboxylation of oxaloacetate in the active site of Macrophomate synthase

Xinyi Li,<sup>†</sup> Fa-Guang Zhang,<sup>‡</sup> Jun-An Ma<sup>‡,\*</sup> and Yongjun Liu<sup>†,\*</sup>

<sup>†</sup> School of Chemistry and Chemical Engineering, Shandong University, Jinan, Shandong 250100, China.

<sup>‡</sup> Department of Chemistry, Tianjin Key Laboratory of Molecular Optoelectronic Sciences, Frontiers Science Center for Synthetic Biology (Ministry of Education), Tianjin University, Tianjin 300072, China.

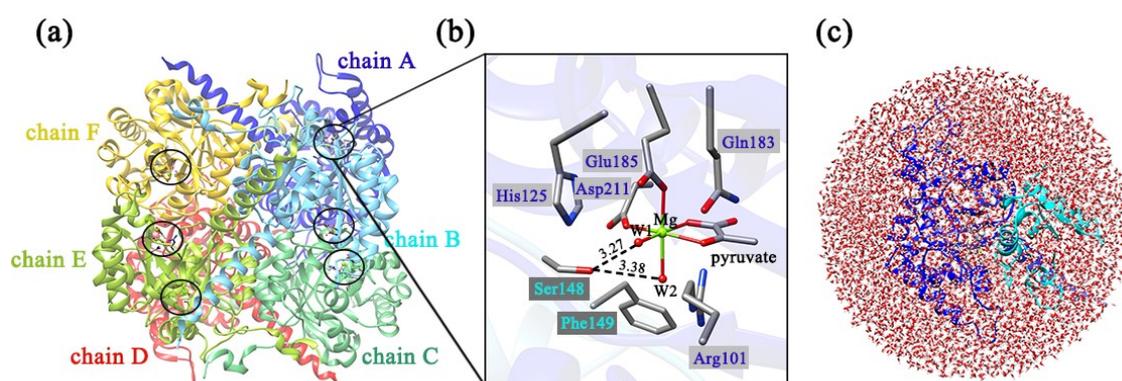

Figure S1. (a) Hexameric crystal structure of MPS (PDB code: 1IZC). (b) Active site of MPS, in which pocket residues His125, Asp211, Glu185, Gln183 and Arg101 are from chain A, while Ser148 and Phe149 are from chain B. (c) Solvated model of pretreatment in this work.

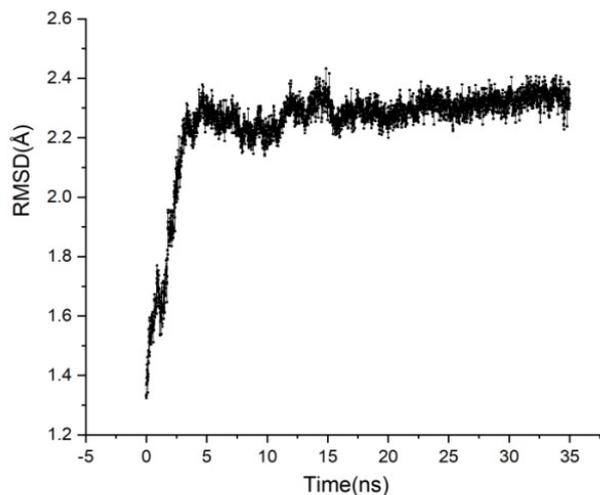

Figure S2. RMSD for the backbone atoms of enzyme-oxaloacetate complex in 35-ns MD simulation.

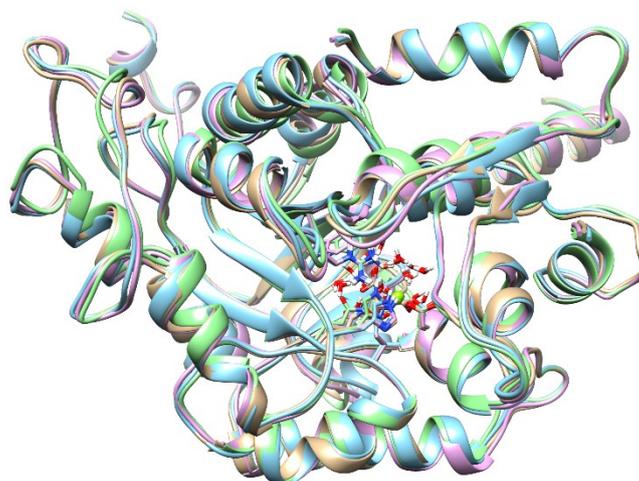

Figure S3. Overlay of four QM/MM-optimized structures which were first derived from snapshots of MD trajectory at 15 (plum), 20 (blue), 25 (tan), 30 (light green) ns and then optimized at B3LYP/B2 level. The structure (shown in blue) at 20 ns is considered to be representative, which was chosen for the QM/MM calculation.

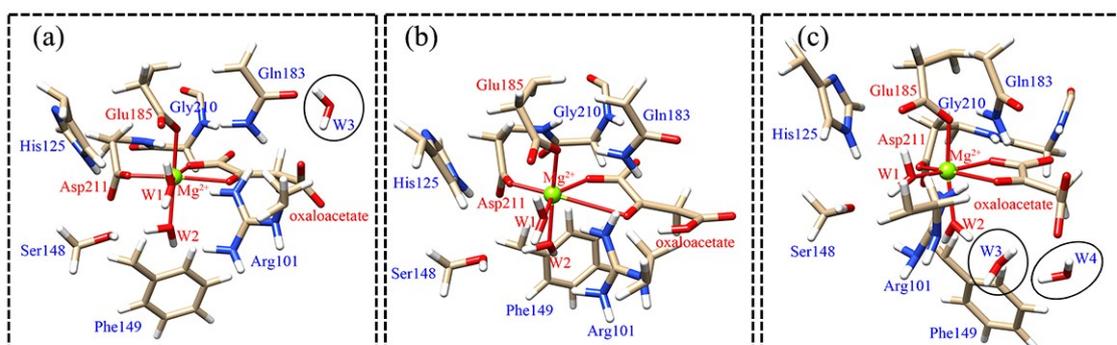

Figure S4. QM regions used for exploring different reactions in this work. (a) QM region for the decarboxylation of the doubly deprotonated oxaloacetate. An additional water

molecule was included in the QM region when the hydration-assisted decarboxylation of OAA was investigated. (b) QM region for the proton migration-assisted decarboxylation of the singly protonated oxaloacetate. (c) QM regions selected for the keto-enol tautomerization of oxaloacetate with the assistance of one or two water molecules.

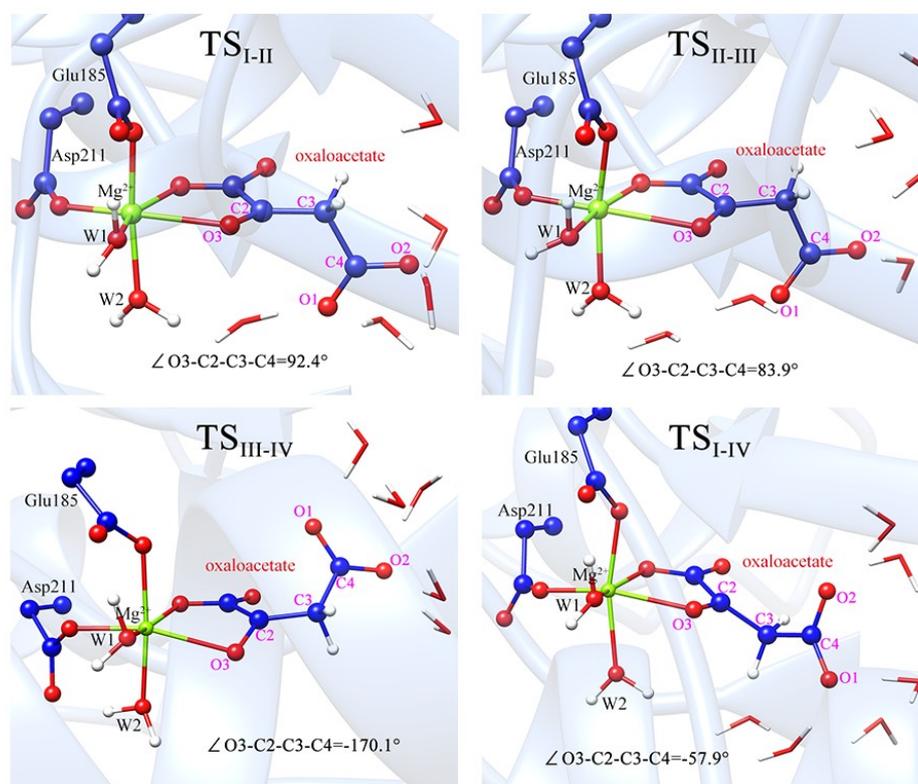

Figure S5. Optimized transition states involved in isomerization of four binding conformations of oxaloacetate from K-I to K-II, K-III and K-IV.

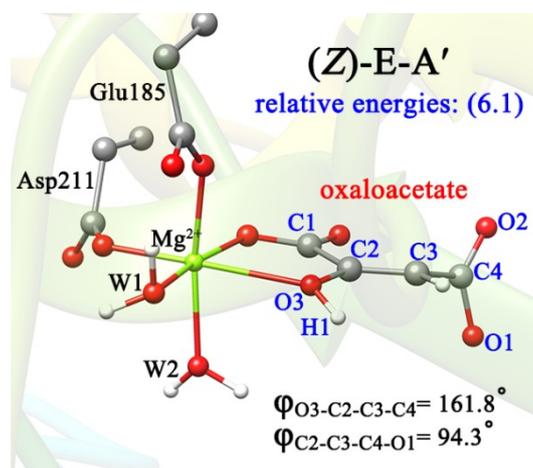

Figure S6. A QM/MM-optimized enolate structure of oxaloacetate binding to the magnesium ion in MPS, which was considered to be dynamically unstable via MD

simulations and easily isomerized into (Z)-E-A. The data in brackets is the QM/MM relative energy when K-I was set to zero in kcal/mol. All distances are present in angstrom.

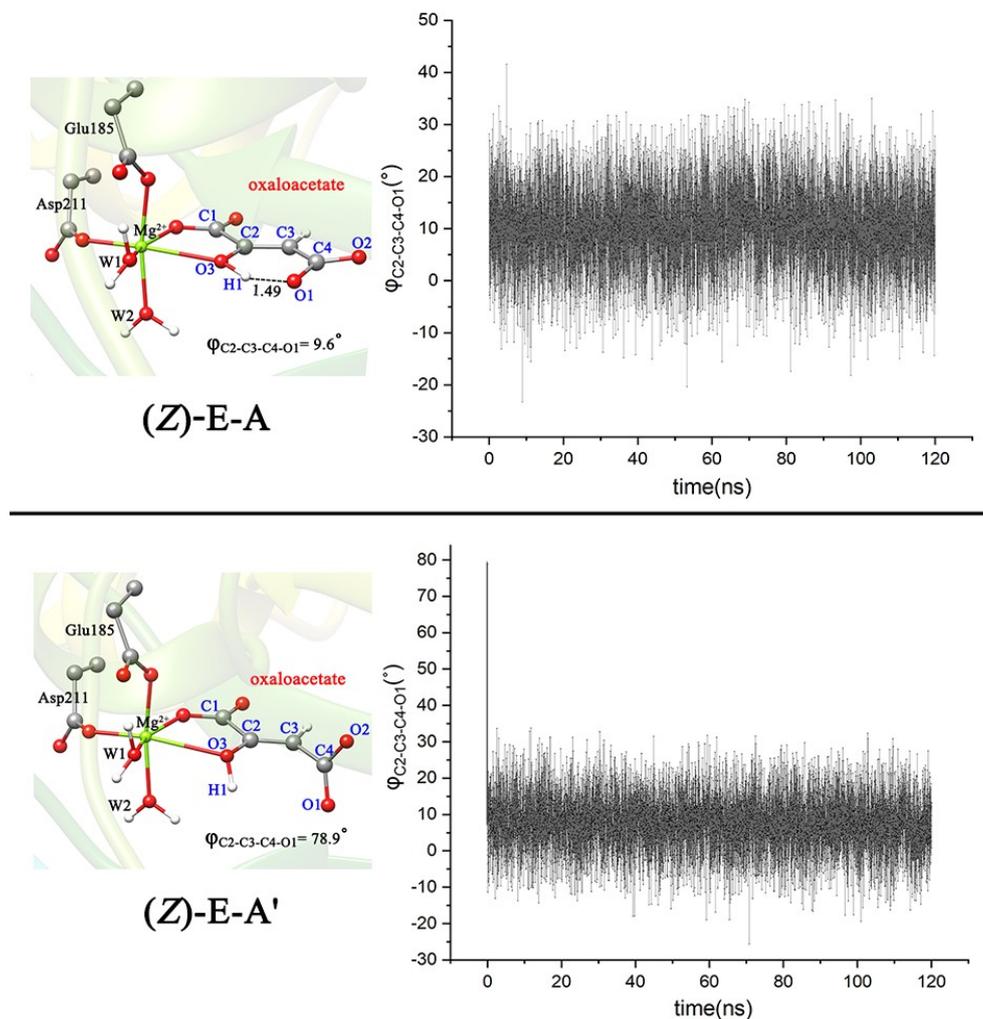

Figure S7. Time evolution of the dihedral of C2-C3-C4-O1 during 120-ns MD simulations of (Z)-E-A (upper panel) and (Z)-E-A' (lower panel). The dihedrals of  $\phi_{O3-C2-C3-C4}$  of (Z)-E-A and (Z)-E-A' all fluctuate around 0 degree and those of  $\phi_{C2-C3-C4-O1}$  all fluctuate around 10 degrees. This indicates that (Z)-E-A' is unstable in MD simulations and can be easily converted into (Z)-E-A, that is, the carboxylate group tends to be parallel to the plane of C=C bond.

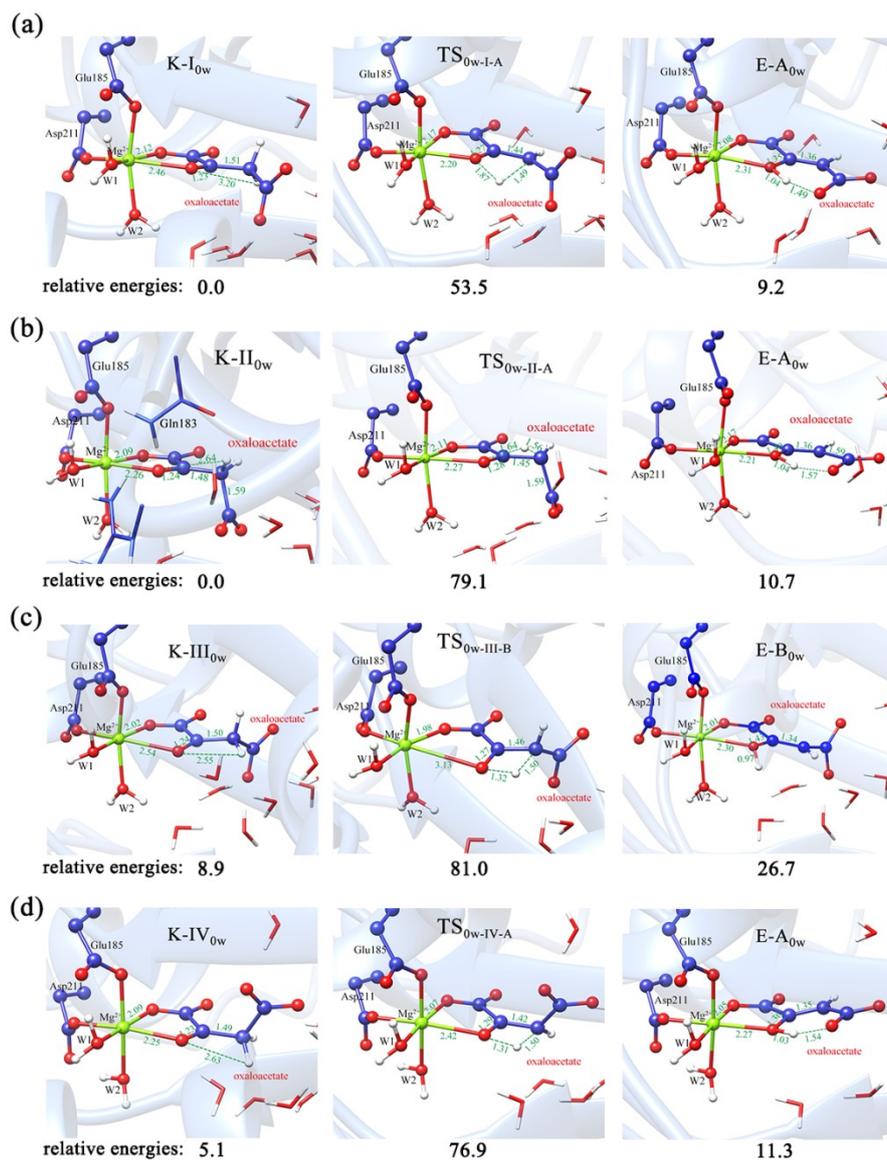

Figure S8. Optimized structures of keto-enol tautomerization without the assistance of water molecule. All distances are given in angstrom and relative energies are in kcal/mol.

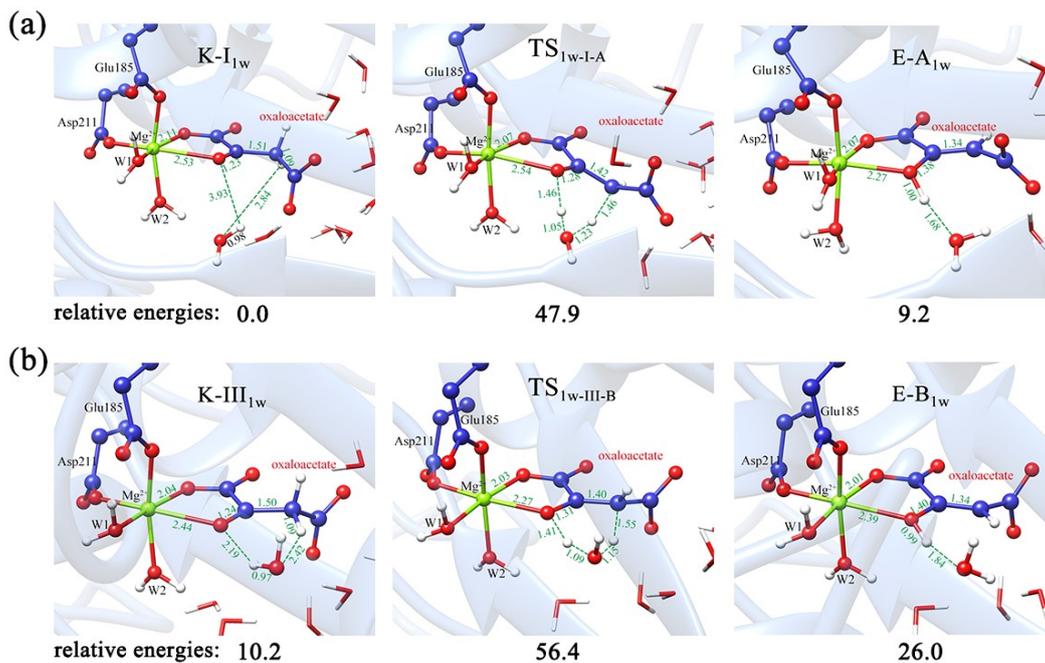

Figure S9. Optimized structures of keto-enol tautomerization of K-I to E-A and K-III to E-B with the assistance of one water molecule. All distances are given in angstrom and relative energies are in kcal/mol.

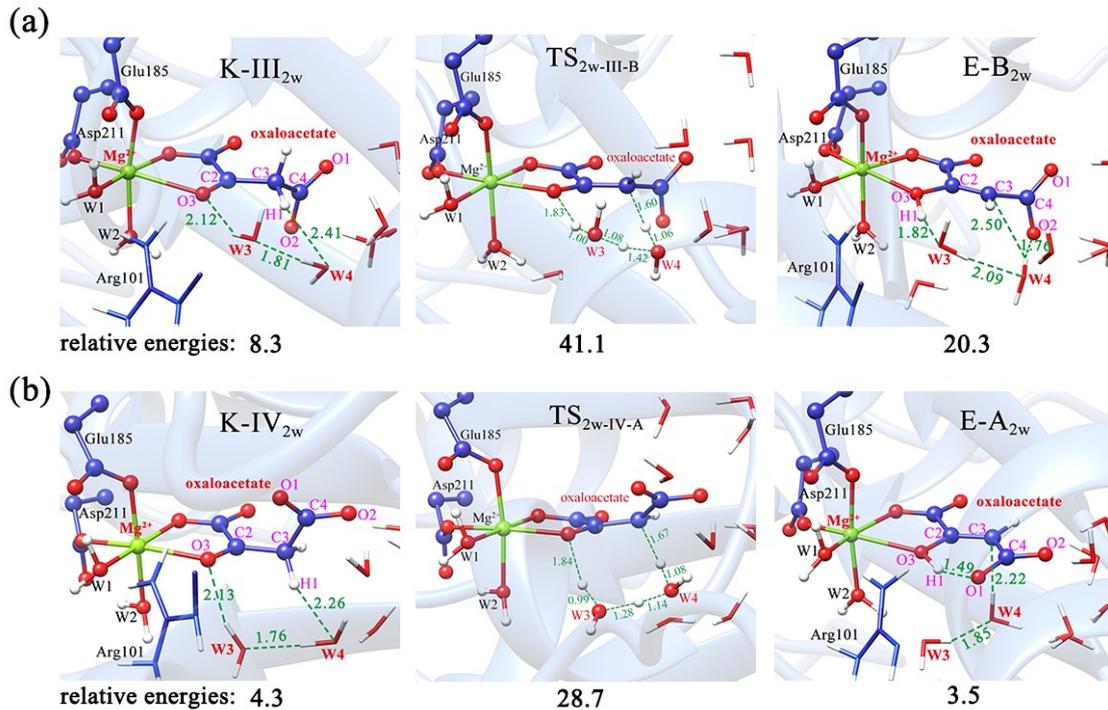

Figure S10. Optimized structures of keto-enol tautomerization of K-III to E-B and K-IV to E-A with the assistance of two water molecules. All distances are given in angstrom and relative energies are in kcal/mol.

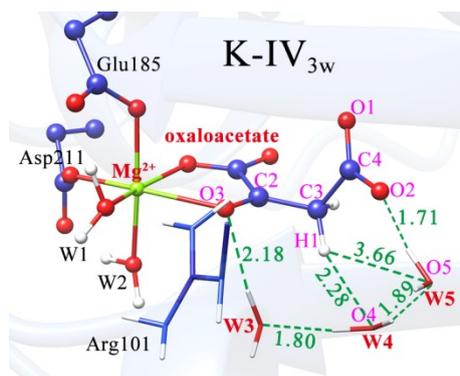

Figure S11. Optimized structures of K-IV in which the QM region contains three mediate water molecules (W3, W4 and W5). All distances are given in angstrom.

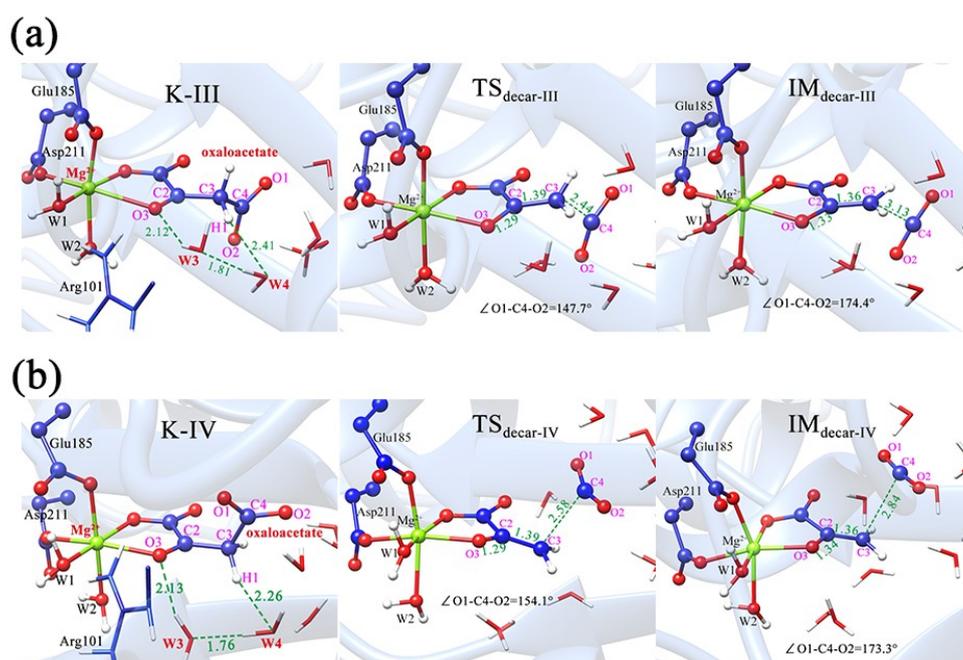

Figure S12. Optimized structures of transition states and intermediates for decarboxylation starting from K-III (a) and K-IV (b). All distances are given in angstrom.

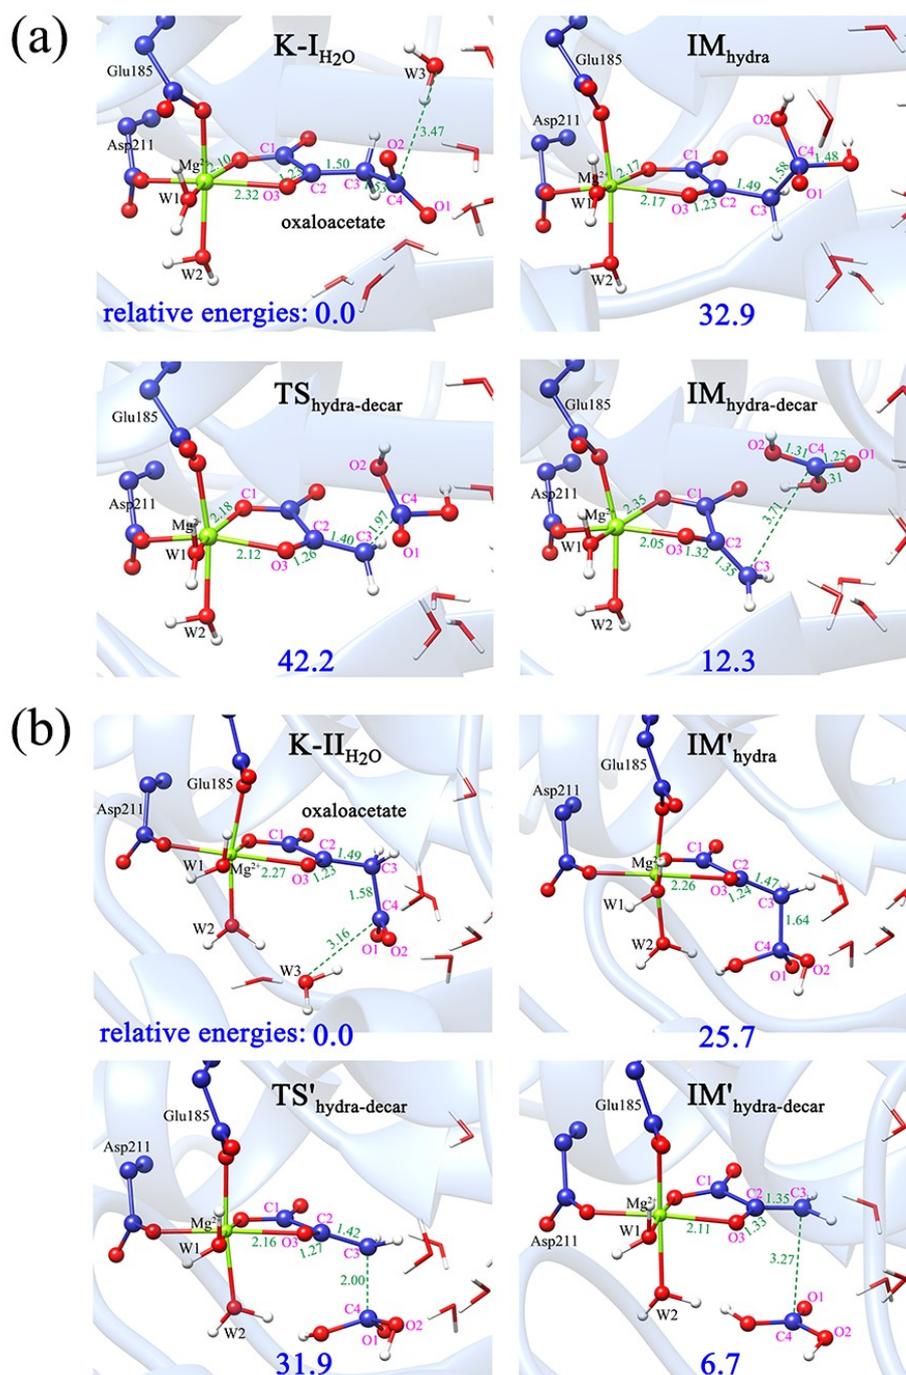

Figure S13. Optimized structures involved in hydration-assisted decarboxylation of oxaloacetate starting from K-I-H<sub>2</sub>O (a) and K-II-H<sub>2</sub>O (b). All distances are given in angstrom and relative energies are in kcal/mol.

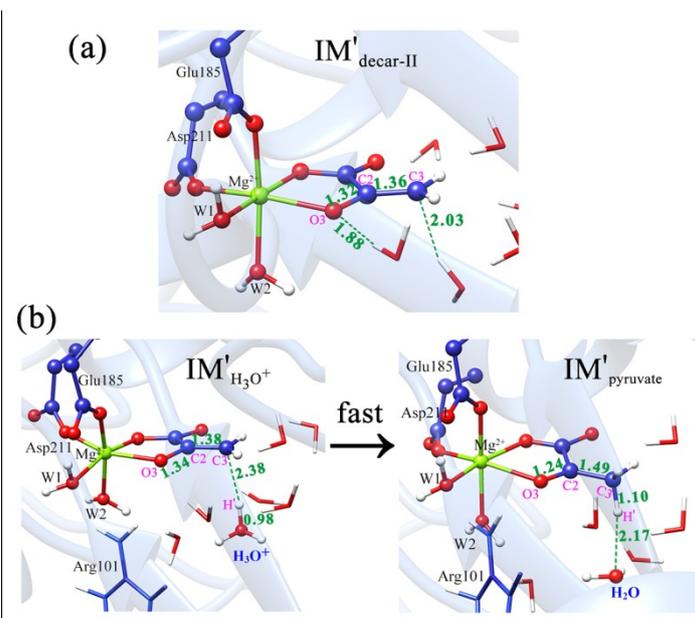

Figure S14. (a) Optimized intermediate structure generated by the decarboxylation of K-II, in which the carbon dioxide has escaped from the active site. (b) Schematic representation of the protonation process of the enolpyruvate intermediate.  $IM1'_{H_3O^+}$  represents the model where a hydrated proton comes from bulk solvent to approach the enolpyruvate, and our optimization indicated that this proton immediately transfers to the enolpyruvate to generate the more stable pyruvate ( $IM'_{pyruvate}$ ). All distances are given in angstrom.

Cartesian coordinates of QM regions of key transition states and intermediates
