The neutral 2PyMIG emission data has been increased by a factor of 20 for easier viewing. The emission at 410 nm are

Raman bands from the DMSO solvent. (Bottom) To compare these spectra with the one shown in Figure 8, we fitted these spectra using three Gaussians and the resulting overall fit and the Raman component for each spectrum are shown by blue solid line and dash line, respectively, in the panel a and c. Upon subtracting the Raman component from the corresponding measured emission spectrum, the difference spectrum appears resemble the emission spectrum of *E*-2PyMIG·HBr (Figure 8) reasonably well, especially for the neutral form, which can be readily seen from the panel b and d. To ease comparison, the *E*-2PyMIG·HBr spectrum (red lines) was scaled.

Excited states from time dependent density functional theory

To select the active space, initial TD-DFT calculations were run at TD- ω B97XD/def2-TZVPP (PCM=DMSO) level of theory for the E_1 and E_2 geometries. In E_1 , the two lowest singlet excited states were found to be close together in energy, at 4.61 and 4.65 eV (Figure S11). However, the lower state has an oscillator strength of 0.0023, while the higher state has one of 0.9775. This indicates the latter state is initially populated in this photoisomerization, though the darker state can also be populated by internal conversion. Furthermore, the NTOs indicate that this state at 4.65 eV is also a $\pi\text{-}\pi^*$ state and is likely to be well-described by the choice of active space shown in Figure 3. Since the active space selected for CASSCF is chosen to describe the $\pi\text{-}\pi^*$ state, it becomes the S_1 state for CASSCF. In E_2 , the lowest energy excited state is at 4.65 eV and is $\pi\text{-}\pi^*$ state as indicated by the NOs (Figure S12). This state has a similarly large oscillator strength at 0.9720. Thus, the S_1 state for both E_1 and E_2 can be characterized as $\pi\text{-}\pi^*$ states and indicate the active space for CASSCF was chosen appropriately.

Excited states from Equation-of-Motion Coupled-Cluster Calculations with Single and Double excitations

TD-DFT calculations show that the $n\text{-}\pi^*$ and a $\pi\text{-}\pi^*$ states are nearly degenerate, with the $n\text{-}\pi^*$ state being 0.04 eV lower in energy. This prompts questions about the role of the $n\text{-}\pi^*$ state in the photochemical behavior of 2PyMIG·HBr on the S_1 surface. We analyzed the state ordering for these systems using EOM-CCSD calculations, with solvent effects included using the PCM model beyond the linear response using the PTED formalism. The results shown in Table S1 show that the $\pi\text{-}\pi^*$ transitions are lower in energy and have a much larger oscillation strength compared to the $n\text{-}\pi^*$ transitions for both the Franck-Condon geometries and the S_1 minima. Therefore, the lowest S_1 excited state near the Franck-Condon geometries has $\pi\text{-}\pi^*$ character, justifying the choice of the active space for CASSCF that includes only the π orbitals.
