Simulation Details

The electrochemical model of OER/ORR in alkaline media could be divided into the four one-electron reactions:

where the * denoted the active site. The adsorption energies of intermediates (OH , O and OOH groups) on substrates were calculated by following:

$$\Delta E_{*\text{O}} = E(\text{sub}/\text{O}) - E(\text{sub}) - [E(\text{H}_2\text{O}) - E(\text{H}_2)] \quad (\text{S5})$$

$$\Delta E_{*\text{OH}} = E(\text{sub}/\text{OH}) - E(\text{sub}) - [E(\text{H}_2\text{O}) - E(\text{H}_2)/2] \quad (\text{S6})$$

$$\Delta E_{*\text{OOH}} = E(\text{sub}/\text{OOH}) - E(\text{sub}) - [2 \times E(\text{H}_2\text{O}) - 3 \times E(\text{H}_2)/2] \quad (\text{S7})$$

where $E(\text{sub}/\text{H}_2\text{O})$, $E(\text{sub}/\text{OH})$, $E(\text{sub}/\text{O})$ and $E(\text{sub}/\text{OOH})$ denoted the total energies of H_2O , OH , O and OOH groups on substrates. $E(\text{sub})$, $E(\text{H}_2\text{O})$ and $E(\text{H}_2)$ were the energies of bare substrate, water, and hydrogen gas, respectively.

The Gibbs free energy changes of steps S1-S4 could be estimated by:

$$\Delta G_1 = \Delta G_{\text{OH}*} \quad (\text{S8})$$

$$\Delta G_2 = \Delta G_{\text{O}*} - \Delta G_{\text{OH}*} \quad (\text{S9})$$

$$\Delta G_3 = \Delta G_{\text{OOH}*} - \Delta G_{\text{O}*} \quad (\text{S10})$$

$$\Delta G_4 = 4.92\text{eV} - \Delta G_{\text{OOH}*} \quad (\text{S11})$$

where the sum of ΔG_{1-4} was fixed to the negative of experimental Gibbs free energy of formation of two water molecules ($-2 \Delta H_2^{\text{exp}} = 4.92 \text{ eV}$). The Gibbs free energy of $(\text{H}^+ + \text{e}^-)$ in solution was estimated as the half energy of H_2 molecule at standard condition.

The overpotential of OER was determined by following equations:

$$\eta^{\text{OER}} = U_{\text{OER}} - 1.23 \quad (\text{S12})$$

$$U_{\text{OER}} = \text{Max}(\Delta G_1, \Delta G_2, \Delta G_3, \Delta G_4)/e \quad (\text{S13})$$

The overpotential of ORR was expressed as:

$$\eta^{\text{ORR}} = 1.23 - U_{\text{ORR}} \quad (\text{S14})$$

$$U_{\text{ORR}} = \text{Min}(\Delta G_1, \Delta G_2, \Delta G_3, \Delta G_4)/e \quad (\text{S15})$$

The proportional relationships between the $\Delta G_{\text{O}*}$, $\Delta G_{\text{OH}*}$ and $\Delta G_{\text{OOH}*}$ values:

$$\Delta G_{\text{OH}*} = 0.611 \times \Delta G_{\text{O}*} - 0.557 \quad (\text{S16})$$

$$\Delta G_{\text{OOH}*} = 0.510 \times \Delta G_{\text{O}*} + 2.431 \quad (\text{S17})$$

The proportional relationships between the ΔG and D_d values:

$$\Delta G_{OH^*} = 0.088 \times D_d - 1.124 \quad (S18)$$

$$\Delta G_{O^*} = 0.141 \times D_d - 0.849 \quad (S19)$$

$$\Delta G_{OOH^*} = 0.079 \times D_d + 1.806 \quad (S20)$$

Table S1. The formation energy of all systems.

Coordination Environment	Dopant Position	E_{system} (eV)	E_C (eV)	E_N (eV)	E_{TM} (eV)	ΔE_{form} (eV)
