## Supplemental Experimental Procedures

*Fabrication of cyclic macromolecular Mo-Ce polyoxometalates precursors and amorphous Mo-Ce oxides:* The cyclic macromolecular Mo-Ce polyoxometalates was synthesized in accordance with published procedures <sup>1</sup>. Specifically,  $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$  (20 mg, 0.05 mmol, Innochem, China) and hydrazine dihydrochloride (3 mg, 0.02 mmol, Innochem, China) were dissolved in 5 mL of deionized water. Then, 1 M HCl (0.4 mL, 0.4 mmol) were added with stirring. Subsequently,  $\text{Na}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O}$  (50 mg, 0.2 mmol, Aladdin, China) were added to the mixture. When the pH value of the solution reached around 1.8, the mixture was placed in an oven at 100 °C for 3-4 days to form dark blue rhombic shaped crystals. After the reaction, the samples were centrifuged and separated with a mixture of ethanol and deionized water several times. This material was named as Mo-Ce POMs. Afterwards, the synthesized precursor was annealed in  $\text{N}_2$  at 400 °C for 2 h, which named as  $\text{MoCeO}_x$ .

*Fabrication of amorphous Mo-Ce oxides supported single-atom Co catalysts:* To synthesize amorphous Mo-Ce oxides supported single-atom Co oxides, we added  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  as the cobalt source during the synthesis of Mo-Ce polyoxometalates precursors. In particular, we dissolved  $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$  (20 mg, 0.05 mmol, Innochem, China), hydrazine dihydrochloride (3 mg, 0.02 mmol, Innochem, China) and  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  (11.9 mg, 0.05 mmol, Aladdin, China) in 5 mL of deionized water. Other synthesis methods are the same as cyclic macromolecular Mo-Ce polyoxometalates precursors catalysts. And this sample is named as  $\text{Co}_{\text{SA}}$ -Mo-Ce POMs. To study the effect of Co content on the OER activity, 0.005, 0.05 and 0.15 mmol  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  were

added in 5 mL of deionized water, and the resulting precursors were named as  $\text{Co}_{\text{SA}0.1}$ -Mo-Ce POMs,  $\text{Co}_{\text{SA}}$ -Mo-Ce POMs,  $\text{Co}_{\text{SA}3}$ -Mo-Ce POMs, which based on the proportion of the precursor input. Then, the synthesized precursors were annealed in  $\text{N}_2$  at 400 °C for 2 h, and these samples were named as  $\text{Co}_{\text{SA}0.09}$ -MoCeO<sub>x</sub>,  $\text{Co}_{\text{SA}}$ -MoCeO<sub>x</sub>, and  $\text{Co}_{\text{SA}1.81}$ -MoCeO<sub>x</sub>, respectively.

*Fabrication of bamboo-like carbon nanotubes (BCT):* First, dicyandiamide (5.0 g, Innochem, China) and  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  (2.2 g, Aladdin, China) were dissolved in 300 ml of deionized water and stirred for dry at 100 °C. Afterwards, the mixture was taken out and ground into powder, and then the powders were annealed in Ar at 800 °C for 1 h. Subsequently, the heat-treated samples were leached in 2 M HCl for 24 h to remove the metal particles remaining in catalysts. Finally, this sample was centrifuged and separated with a mixture of ethanol and deionized water several times and dried at 80 °C.

*Fabrication of amorphous Mo-Ce oxides supported single-atom Co catalysts coated with bamboo-like carbon nanotubes ( $\text{Co}_{\text{SA}}$ -MoCeO<sub>x</sub>@BCT):* BCT (25 mg) was put into a three-necked flask with an air valve, and evacuated to ca. 30 Pa. Then, the ethanol mixture (20 ml) dissolved with 25 mg  $\text{Co}_{\text{SA}}$ -Mo-Ce POMs precursor was quickly dropped into the three-necked flask and magnetically stirred for 5 h. The sample was filtrated and freeze-dried, then washed repeatedly with deionized water and dried under vacuum. Then, the as-prepared ground samples were put into a tube furnace and heated at 400 °C for 2 hours in a  $\text{N}_2$  gas flow. This sample was named as  $\text{Co}_{\text{SA}}$ -MoCeO<sub>x</sub>@BCT.

*Fabrication of  $\text{Co}_{\text{SA}}$ -MoCeO<sub>x</sub>@BCT loaded electrodes:* The electrocatalysts (5 mg) and

Vulcan XC-72 carbon powder (5 mg) were dispersed in a mixture of 1 ml of deionized water and isopropanol (Aladdin, China) with a volume ratio of 3: 1, with 40  $\mu$ l of 5% Nafion solution as a binder. After ultrasonication for 30 minutes, 30  $\mu$ l of homogeneous ink was dropped on a carbon paper substrate (Fuel Cell Earth, TGP-H-060) (area, 0.25  $\text{cm}^2$ ) and fully dried in air at room temperature. The mass loadings of the electrocatalysts onto carbon paper were controlled at approximately 0.6  $\text{mg cm}^{-2}$ .

*Fabrication of  $\text{IrO}_2/\text{C}$  and  $\text{Pt}/\text{C}$  loaded electrodes:*  $\text{IrO}_2/\text{C}$  commercial catalysts (Aladdin, China, 99%) or 20%  $\text{Pt}/\text{C}$  commercial catalysts (Johnson Matthey, USA, 99%) were dispersed in 1 ml of isopropanol with 40  $\mu$ l of 5% Nafion and ultrasonicated for 30 minutes. Later, the solution was loaded on the surface of a carbon paper substrate (Fuel Cell Earth, TGP-H-060) (area, 0.25  $\text{cm}^2$ ) with a loading of 0.6  $\text{mg cm}^{-2}$  for  $\text{IrO}_2$  or 20%  $\text{Pt}/\text{C}$  catalysts.

*Material characterizations:* Infrared spectroscopy were collected in transmission mode using an ATR fitted Nicolet iS50R spectrometer (Thermo Scientific, USA). UV-vis spectra were recorded on a Lambda 35 spectrophotometer (PerkinElmer, USA) using 1 cm pathlength cuvettes. Thermogravimetric analysis characterizations were performed on a Pyris1 TGA Thermogravimetric analyzers (PerkinElmer Instruments, China) under  $\text{N}_2$  atmosphere with a heating rate of 10  $^\circ\text{C min}^{-1}$ . Mass spectrometry characterization were performed on a bruker ultraflex extreme MALDI-TOF/TOF instrument (Bruker, USA). Transmission electron microscopy (TEM) characterizations were obtained on a Tecnai G2 transmission electron microscope (FEI, USA). High-resolution transmission electron microscope (HR-TEM) was carried out by a Talos

F200X transmission electron microscope (FEI, Netherlands). X-ray diffraction (XRD) patterns were obtained using a DMAX-2400X-ray diffractometer (Rigaku, Japan). Raman measurements were performed using a LabRAM HR Evolution (Horiba JobinYvon, France) with 532 nm excitation wavelength. X-ray photoelectron spectroscopy (XPS) was carried out with an Axis-Ultra DLD-600W X-ray photoelectron spectrometer (Shimadzu, Japan). X-ray fluorescence (XRF) patterns were obtained from EAGLE III operated at 40 kV. Inductively coupled plasma-optical emission spectrometry (ICP-OES) were carried out by an iCE 3000 Series AA spectrometer (Thermo Scientific, USA). X-ray absorption spectroscopy (XAS) was determined by the XAS measurement at the beamline BL11B1 of the Shanghai Synchrotron Radiation Facility (SSRF).

*Electrochemical characterization:* The OER polarization curves were carried out with a CHI 760D (Chenhua, China) electrochemical workstation in 0.5 M H<sub>2</sub>SO<sub>4</sub> electrolyte in a typical three-electrode system with a scan rate of 5 mV s<sup>-1</sup> at room temperature. The as-prepared Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT sample was used as the working electrode for electrochemical characterizations, the Ag/AgCl reference electrode was used as reference electrode and a commercial carbon rod was used as counter electrode. The potential was calibrated to reversible hydrogen electrode (RHE) through measuring the potential difference between the Ag/AgCl reference electrode and RHE. The Faraday efficiency of MoCeO<sub>x</sub>, Co<sub>SA</sub>-MoCeO<sub>x</sub> and Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT samples were carried out on a Shimadzu GC-2014 gas chromatograph (Shimadzu, Japan) in 0.5 M H<sub>2</sub>SO<sub>4</sub> electrolyte to analyze the composition of gas products by using a two-electrode system

(Pt/C catalysts as the cathode). The long-time overall acid solution water splitting stability curves were carried on a LAND C3001B battery measurement system (Wuhan, China) in 0.5 M H<sub>2</sub>SO<sub>4</sub> electrolyte and the Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT electrodes and commercial Pt/C materials were used as anode and cathode, respectively. All electrochemical measurements do not have any iR compensation.

*Electrochemical impedance spectroscopy measurements:* To evaluate the charge transfer resistance, electrochemical impedance spectroscopy measurements were carried out by applying an AC voltage of 10 mV in the frequency range of 100000-0.1 Hz at 1.47 V (vs RHE).

*Proton exchange membrane water electrolyzers (PEMWEs):* Membrane electrode assemblies (MEAs) were prepared using a Nafion®117 polymer membrane (DuPont, thickness 177.8 μm, N117). Before MEAs preparation, the N117 membrane was boiled separately for half an hour in the following solutions to remove possible contaminants and ensure complete protonation: first 3 wt.% H<sub>2</sub>O<sub>2</sub>, then MilliQ ultra-pure water, then 1.0 M H<sub>2</sub>SO<sub>4</sub>, and finally MilliQ ultra-pure water. Finally, the N117 film is dried in a 40 °C oven for several hours before use. Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT materials and the commercial Pt/C catalysts were used as the anode and cathode, and the mass loadings were controlled at 3.2 mg cm<sup>-2</sup> of Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT and 0.2 mg cm<sup>-2</sup> of commercial Pt/C catalysts, respectively. The effective area of the MEA was 5 cm<sup>2</sup>. Electrolysis tests were conducted using a single cell PEMWE. The titanium meshes were used as gas diffusion layers for both the anode and cathode. During the test, the cell was maintained at room temperature, and the pre-heated DI water was fed to the

anode at a flow rate of 10 ml min<sup>-1</sup> (pipe diameter 4.8 mm).

*In situ Raman experimental details:* Raman measurements were performed using a LabRAM HR Evolution (Horiba JobinYvon, France) with 532 nm excitation wavelength. Before the test, the samples and Vulcan XC-72 carbon powder were dropped on a carbon paper substrate (Fuel Cell Earth, TGP-H-060) (area, 1 cm<sup>2</sup>) at a ratio of 1:1 and fully dried in air at room temperature. The mass loading of the electrocatalysts on the carbon paper were controlled at about 0.6 mg cm<sup>-2</sup>. All the *in situ* spectra were collected in an *in situ* Raman gas diffusion H-type electrolytic cell (gaosunoin, China) with 0.5 M H<sub>2</sub>SO<sub>4</sub> as the electrolyte after the samples were operated at constant voltage for 5 min.

*Operando x-ray absorption structure (XAS) spectroscopy experimental details:* The *operando* Co K-edge XAS spectroscopy of the Co<sub>SA</sub>-MoCeO<sub>x</sub> electrocatalyst were collected on the beamline BL11B1 of the shanghai Synchrotron Radiation Facility (SSRF). A cobalt foil is used to calibrate the energy. During the *operando* XAS measurements, the method of constant potential is applied. *Operando* XAS spectroscopy signals were collected in fluorescence mode using an *in situ* electrochemical cell with polyimide film windows (XAFS-2, gaosunoin, China). To monitor the changes of electrodes during the OER process, anodic voltages from 1.1 to 1.5 V versus RHE are applied for Co<sub>SA</sub>-MoCeO<sub>x</sub> catalysts, respectively. For each XAS spectroscopy collection, the selected constant potential is first applied to the electrodes in 0.5 M H<sub>2</sub>SO<sub>4</sub> electrolyte for 10 min as the pretreatment step. Subsequently, the XAS spectra of electrocatalysts are collected through a fluorescence mode within 30 min. It

would take about 40 min for the XAS measurement under each constant potential applied. The data reductions of the experimental spectra to normalized XANES and Fourier-transformed radial distribution functions (RDFs) were performed through the standard XAS procedure.

*Lattice oxygen ion diffusion coefficients measurement:* The same three-electrode configuration was used for the measurement, and the LSV scanning was performed in sulfuric acid solutions with pH=0, 1, 2, and 3 respectively to obtain the OER polarization curves with a scan rate of 5 mV s<sup>-1</sup> at room temperature. The electrolytic current density of water splitting was recorded under the voltage of 1.6 V, and linear fitting was performed to estimate the oxygen ion diffusion coefficient of different samples.

*In situ <sup>18</sup>O isotope labeling differential electrochemical mass spectrometry (DEMS) experimental details:* The *in situ* DEMS experiments of the Co<sub>SA</sub>-MoCeO<sub>x</sub>@BCT electrocatalyst on an *in situ* differential electrochemical mass spectrometer provided by Linglu Instruments (QAS100, Shanghai) Co. Ltd. First, pristine samples were isotopically labeled with <sup>18</sup>O in <sup>18</sup>O-labeled 0.5 M H<sub>2</sub>SO<sub>4</sub> solution at 1.5 V for 10 min. The resultant electrodes were then rinsed several times with H<sub>2</sub><sup>16</sup>O and dried in an oven to remove residual H<sub>2</sub><sup>18</sup>O. After these processes, the samples were subjected to chronoamperometry at 1.5 V for *in situ* DEMS measurements. To exclude the influence of <sup>18</sup>O natural abundance, the mass signal of <sup>34</sup>O<sub>2</sub> is normalized by the total signal intensity of <sup>36</sup>O<sub>2</sub> obtained in the same test, and the total signal intensity of <sup>32</sup>O<sub>2</sub> and <sup>34</sup>O<sub>2</sub> is defined as the integrated area of the intensity curve.

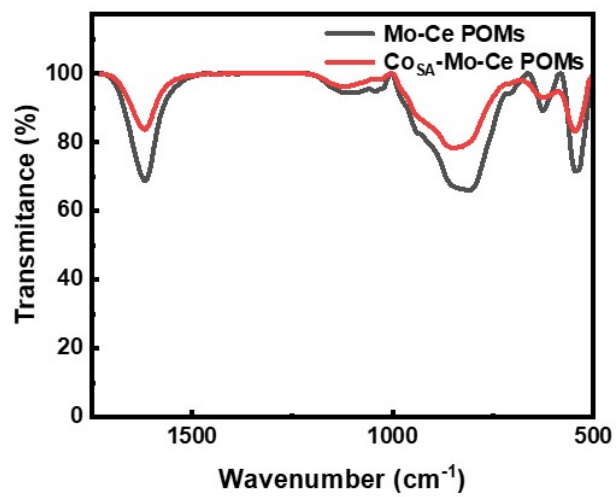

*Computational methods:* Spin-polarized DFT calculations were performed using the Vienna ab initio simulation package (VASP).<sup>2 3</sup> The generalized gradient approximation proposed by Perdew, Burke, and Ernzerhof (GGA-PBE) is selected for the exchange-correlation potential.<sup>4</sup> The pseudo-potential was described by the projector-augmented-wave (PAW) method.<sup>5</sup> The geometry optimization is performed until the Hellmann–Feynman force on each atom is smaller than  $0.02 \text{ eV}\cdot\text{\AA}^{-1}$ . The energy criterion is set to  $10^{-6} \text{ eV}$  in iterative solution of the Kohn-Sham equation.

Red circles represent the intermediates on MoCeO<sub>x</sub> following the LOM.

**Fig. S50** The OER process follows LOM on CoMoCeO<sub>x</sub>. (a) 2O\*, (b) O<sub>2</sub>\*+V<sub>O</sub>, (c) O<sub>2</sub>+V<sub>O</sub>, (d) OH\*+V<sub>O</sub>, (e) O\*+V<sub>O</sub>, and (f) O\*+OH\*, and the Mo, Ce, Co, O, H are colored by green, blue, red, white and purple, respectively. Red circles represent the intermediates on Co<sub>SA</sub>-MoCeO<sub>x</sub> following the LOM.

**Fig. S51** (a) Calculation models and the electronic distributions of  $\text{Co}_{\text{SA}}\text{-MoCeO}_x\text{@BCT}$ . (b) OER calculation results of  $\text{Co}_{\text{SA}}\text{-MoCeO}_x$  and  $\text{Co}_{\text{SA}}\text{-MoCeO}_x\text{@BCT}$ .

**Fig. S52** The OER process follows LOM on  $\text{Co}_{\text{SA}}\text{-MoCeO}_x\text{@BCT}$ . (a)  $2\text{O}^*$ , (b)  $\text{O}_2^*+\text{V}_\text{O}$ , (c)  $\text{O}_2+\text{V}_\text{O}$ , (d)  $\text{OH}^*+\text{V}_\text{O}$ , (e)  $\text{O}^*+\text{V}_\text{O}$ , and (f)  $\text{O}^*+\text{OH}^*$ , and the Mo, O, H are colored by green, white and purple, respectively. Red circles represent the intermediates on  $\text{Co}_{\text{SA}}\text{-MoCeO}_x\text{@BCT}$  following the LOM.

**Table S1.** Co content in metallic elements of amorphous Mo-Ce oxides supported single-atom Co catalysts coated with bamboo-like carbon nanotubes according to XRF characterization.

Sample	Chemical composition	Co (At %)	Mo (At %)	Ce (At %)
1	MoCeO <sub>x</sub>	0	86.04	13.96
2	Co <sub>SA0.09</sub> -MoCeO <sub>x</sub>	0.09	88.49	11.42
3	Co <sub>SA</sub> -MoCeO <sub>x</sub>	1.77	88.34	9.89
4	Co <sub>SA1.81</sub> -MoCeO <sub>x</sub>	1.81	82.90	15.29
5	Co <sub>SA</sub> -MoCeO <sub>x</sub> @BCT	1.71	86.59	11.70

**Table S2.** EXAFS fitting parameters at the Mo K-edge for various samples.

Sample	Path	C.N.	R (Å)	$\sigma^2$ (Å <sup>2</sup> )	R-factor
MoO <sub>2</sub>	Mo-O	6	1.60	0.0128	0.00071
	Mo-Mo	6	2.20	0.0056	
MoCeO <sub>x</sub>	Mo-O	5.22	1.16	0.0136	0.00078
Co <sub>SA</sub> - MoCeO <sub>x</sub>	Mo-O	5.15	1.15	0.0094	0.00061
MoO <sub>3</sub>	Mo-O	6	1.13	0.0030	0.00053
	Mo-Mo	6	1.70	0.0055	

**Table S3.** EXAFS fitting parameters at the Co K-edge for various samples.

Sample	Path	C.N.	R (Å)	$\sigma^2$ (Å <sup>2</sup> )	R-factor
CoO	Co-O	4	1.71	0.0138	0.00088
	Co-Co	12	2.70	0.0053	
Co <sub>SA</sub> - MoCeO <sub>x</sub>	Co-O	5.08	1.69	0.0135	0.00114
Co <sub>2</sub> O <sub>3</sub>	Co-O	6	1.50	0.0093	0.00086
	Co-Co	12	2.51	0.0081
