## CONTENTS

### List of Figures

Figure. S1 Location and characteristics of the Yangtze River Economic Belt

Figure. S2 Spatio-temporal distribution of ecological health index in the Yangtze River Economic Belt

Figure. S3 Distribution of ecological health index in Yangtze River Economic Belt

Figure. S4 Spatio-temporal distribution of ecosystem services in the Yangtze River Economic Belt

Figure. S5 Distribution of ecosystem service index in Yangtze River Economic Belt

Figure. S6 Distribution of influence coefficient of ecosystem service index on ecological health index in Yangtze River Economic Belt

### List of Tables

Text S1. Comprehensive index evaluation

### List of Tables

Table S1 Weights of ecological health evaluation index

Table S2 Estimated results of the OLS model from 1990 to 2020

## Supplemental Experimental

Text S1. Comprehensive index evaluation

1) Assume that there are  $m$  evaluation objects, and each object has  $n$  evaluation indexes. Based on this, the judgment matrix is constructed as Equation (1):

$$X = (x_{ij})_{m \times n} (i=1,2,\dots,m; j=1,2,\dots,n) \quad (1)$$

2) Standardize the judgment matrix:

The positive index and negative index are shown as follows:

$$x'_{ij} = \frac{x_{ij} - \min(x_{ij})}{\max(x_{ij}) - \min(x_{ij})} \quad (2)$$

$$x''_{ij} = \frac{\max(x_{ij}) - x_{ij}}{\max(x_{ij}) - \min(x_{ij})} \quad (3)$$

3) Calculate information entropy:

$$H_j = -k \sum_{i=1}^m p_{ij} \ln p_{ij} \quad (4)$$

where  $p_{ij} = \frac{x'_{ij}}{\sum_{i=1}^m x'_{ij}}$ ;  $k = \frac{1}{\ln m}$ .

4) Determine the weight of index  $j$ :

$$w_i = \frac{1 - H_i}{\sum_{j=1}^n (1 - H_j)} \quad (5)$$

where  $w_j \in [0,1]$ ,  $\sum_{j=1}^n w_j = 1$ . The weights of each index of the ecological health evaluation system

are shown in the table S1.

5) Calculate the weighted matrix:

$$R = (r_{ij})_{m \times n}, r_{ij} = w_j \times x_{ij} (i=1,2,\dots,n) \quad (6)$$

6) Determine the optimal solution  $S_j^+$  and worst solution  $S_j^-$ :

$$S_j^+ = \max(r_{1j}, r_{2j}, \dots, r_{nj}), S_j^- = \min(r_{1j}, r_{2j}, \dots, r_{nj}) \quad (7)$$

7) Calculate the Euclidean distance between the optimal solution and the worst solution of each scheme:

$$sep_i^+ = \sqrt{\sum_{j=1}^n (s_j^+ - r_{ij})^2}, sep_i^- = \sqrt{\sum_{j=1}^n (s_j^- - r_{ij})^2} \quad (8)$$

8) Calculate the comprehensive evaluation index:

$$C_i = \frac{sep_i^-}{sep_i^+ + sep_i^-}, C_i \in [0,1] \quad (9)$$

In the formula, when the value of  $C_i$  is larger, the evaluation object is better.

Table S1 Weights of ecological health evaluation index

Target Layer	Criterion Layer	Index Level	Weight relative to the criterion layer	Weight relative to the target layer
Ecosystem Health	Ecological Vitality (0.355)	NDVI	0.432	0.153
		NPP	0.135	0.048
		LST	0.433	0.154
	Ecological Organization (0.252)	Spread index	0.212	0.053
		Shannon uniformity	0.146	0.037
		Shannon Diversity	0.376	0.095
	Ecological Restoration (0.393)	Dispersion and juxtaposition index	0.266	0.067
		Ecological Resistance Index	0.543	0.213
		Ecological Resilience Index	0.457	0.180
