Materials

The copper (II) nitrate ($\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$), tetrapropyl ammonium hydroxide (TPAOH) (40 wt.%), polyethylene glycol hexadecyl ether, Polyoxyethylene (10) cetyl ether (Brij-C10) were purchased from Sigma-Aldrich. The tetraethyl orthosilicate (TEOS), aqueous ammonium hydroxide (~28%), aluminum nitrate ($\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$) were purchased from Daejung Chemicals. Besides, the cyclohexane and zinc nitrate hexahydrate ($\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$) were obtained from Samchun Chemicals and Duksan Pure Chemicals respectively.

Supplementary methods

Conversion of CO_2 (X_{CO_2}) and product distributions (S_j) with a unit of mol% on the hybrid $\text{CZ}(x)@\text{Z}(y)\text{-t}$ catalysts were calculated by using the following separate equations of (1) and (2), where N stands for an inlet and outlet mole of CO_2 reactant (i) and products (j) such as DME, methanol, and hydrocarbons.

$$X_{\text{CO}_2} = (1 - N_{i,\text{out}}/N_{i,\text{in}}) \times 100\% \quad (1)$$

$$S_j = (N_j/(N_{i,\text{in}} - N_{i,\text{out}})) \times 100\% \quad (2)$$

Turnover frequency (TOF (h^{-1})) of CO_2 conversion was calculated according to the equation (3), where SV represents space velocity (3000mL/g/h), $M_{\text{cat.}}$ represents catalyst amount of $\text{CZ}(x)@\text{Z}(y)\text{-t}$ (0.2 g), W_{CuO} stands for CuO content in the $\text{CZ}@\text{Z}$ catalysts determined by XRF analysis, and N_{Cu} stands for the active copper composition which was estimated from $\text{H}_2\text{-TPR}$ analysis (50 - 410 °C). Space-time yield (STY, g/(g_{Cu}·h)) was calculated according to the average of Cu content in the catalyst.

$$\text{TOF} = ((\text{SV} \times M_{\text{cat.}} \times 24.0\% \times X_{\text{CO}_2}) / (22.4 \times 10^3)) / ((M_{\text{cat.}} \times W_{\text{CuO}} \times N_{\text{Cu}}) / 63.546) \quad (3)$$

$$\text{STY} = (\text{SV} / 22.4 \times 24.0\% \times X_{\text{CO}_2} \times S_{\text{DME}} \times 46.07) / (W_{\text{CuO}} \times 63.546 / 79.545) \quad (4)$$

^aCatalytic performances were obtained at the reference feed gas composition of H₂/CO₂ = 3. ^bHC represents hydrocarbons products. ^cProductivity for DME and methanol (MeOH) was presented with the unit of (g/(g_{Cu}·h)).

Table S3. Catalytic performances of the hybridized reference CZ@Si and ZSM-5 catalysts with different preparation methods

Catalyst ^a	X _{CO2} (mol%)	Product distribution (mol%)			
		CO	HC	Methanol	DME
CZ@Si	17.7	31.2	9.0	59.8	0
CZ@Si/ZSM-5(1/1)	23.1	41.5	4.7	30.2	23.6
CZ@Si/ZSM-5(1/2)	13.1	47.6	36.2	11.6	4.6
CZ(0.9)@Z(60)-24	20.8	17.9	0.5	19.4	62.2
CZ(0.9)/ZSM-5(60)	12.5	34.5	0.5	34.2	30.8

^aCO₂ conversion (X_{CO2}) and product distribution (selectivity to CO, hydrocarbons (HC, mainly CH₄), methanol and dimethyl ether (DME)) were measured at the reaction condition of T = 260 °C, P = 5.0 MPa, space velocity (SV) = 3000 mL/(g_{cat}·h) with a feed gas of CO₂/H₂/N₂ = 72/24/4. The CZ@Si/ZSM-5(1/1 or 1/2) represents the Cu-ZnO(0.9) nanoparticles-encapsulated with SiO₂ shells and physically mixed with the ZSM-5(60) zeolite at different CZ@Si/ZSM-5 ratio of 1/1 or 1/2. The CZ(0.9)/ZSM-5(60) represented the hybridized catalyst prepared by a simple wet impregnation method. The data were presented with steady state values when they were stabilized after its initial induction period.
