

Table S1 Ingredient composition of the experimental diets fed to mice.

Low-fat diet (D12450J)		High-fat diet (D12492)	
Ingredient	g/kg	Ingredient	g/kg
Casein, 30 Mesh	200	Casein, 30 Mesh	200
L-Cystine	3	L-Cystine	3
Corn Starch	506.2	Corn Starch	0
Maltodextrin 10	125	Maltodextrin 10	125
Sucrose	68.8	Sucrose	68.8
Cellulose, BW200	50	Cellulose, BW200	50
Soybean Oil	25	Soybean Oil	25
Lard*	20	Lard*	245
Mineral Mix S10026	10	Mineral Mix S10026	10
DiCalcium Phosphate	13	DiCalcium Phosphate	13
Calcium Carbonate	5.5	Calcium Carbonate	5.5
Potassium Citrate, 1 H ₂ O	16.5	Potassium Citrate, 1 H ₂ O	16.5
Vitamin Mix V10001	10	Vitamin Mix V10001	10
Choline Bitartrate	2	Choline Bitartrate	2
FD&C Yellow Dye #5	0.04	FD&C Blue Dye #1	0.05
FD&C Blue Dye #1	0.01		
Energy	kcal%	Energy	kcal%
Protein	20	Protein	20
Carbohydrate	70	Carbohydrate	20
Fat	10	Fat	60
Saturated fatty acid / unsaturated fatty acid ratio	0.8:1	Saturated fatty acid / unsaturated fatty acid ratio	9.8:1
Total kcal/gm	3.85	Total kcal/gm	5.24

*Typical analysis of cholesterol in lard = 0.72 mg/gram.

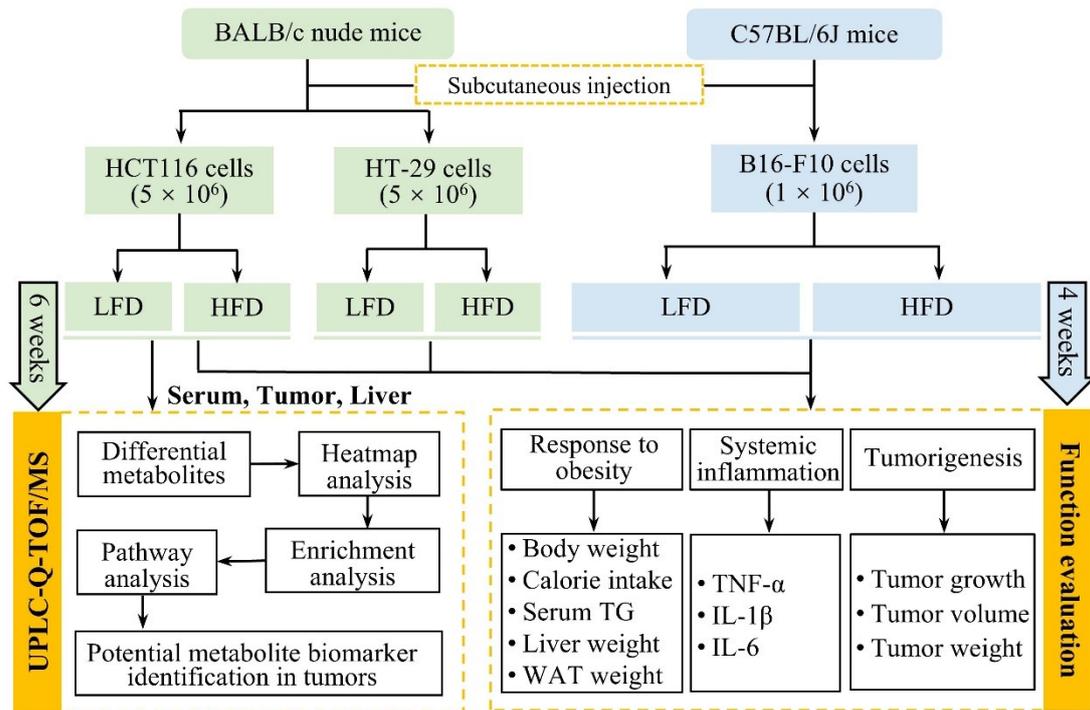

Fig. S1. The experimental design flowchart.

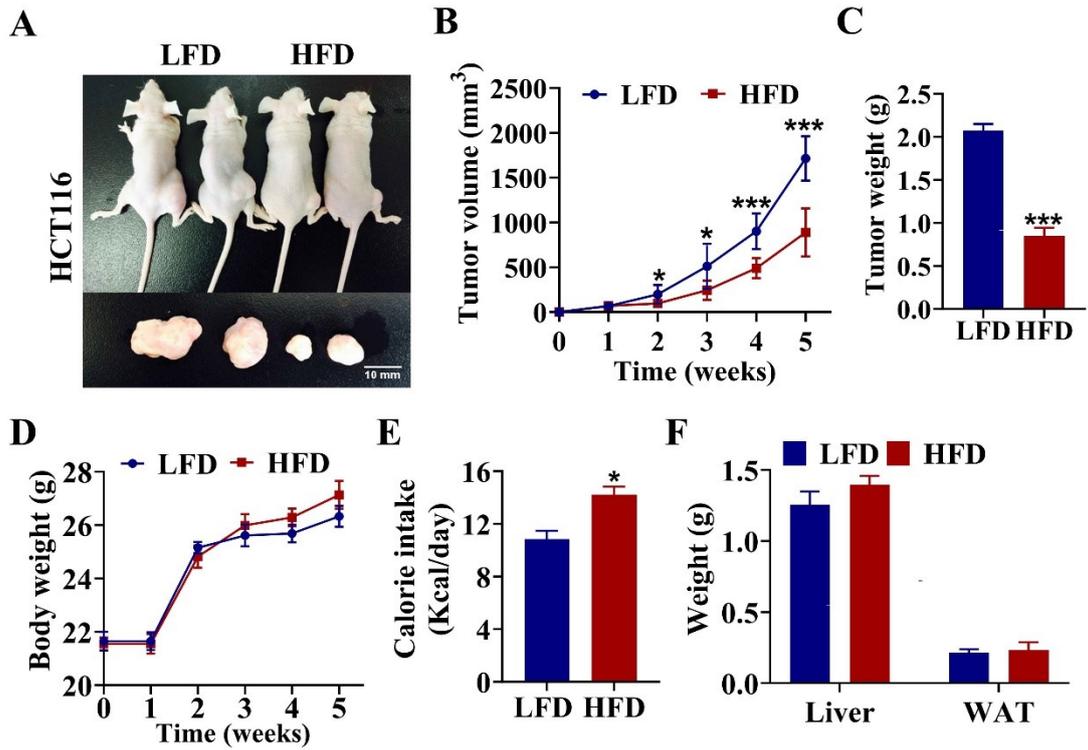

Fig. S2. Pilot study reveals that HFD inhibited HCT116 CRC xenograft tumor growth in BALB/c nude mice. (A) Morphology of xenograft tumors, scale bar: 10 mm; (B) Tumor volume; (C) Tumor weight; (D) Body weight; (E) Calorie intake; (F) Weight of liver and WAT. Data are expressed as mean \pm SD (n = 3). * p <0.05 and *** p <0.001, LFD group vs. HFD group.

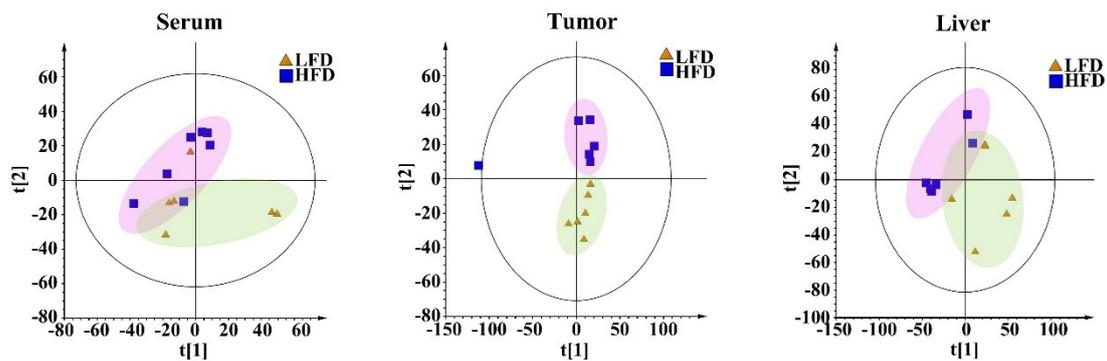

Fig. S3. The PCA score plots in serum, tumor, and liver samples from HCT116 xenograft nude mice between the LFD and HFD groups through untargeted metabolomics.

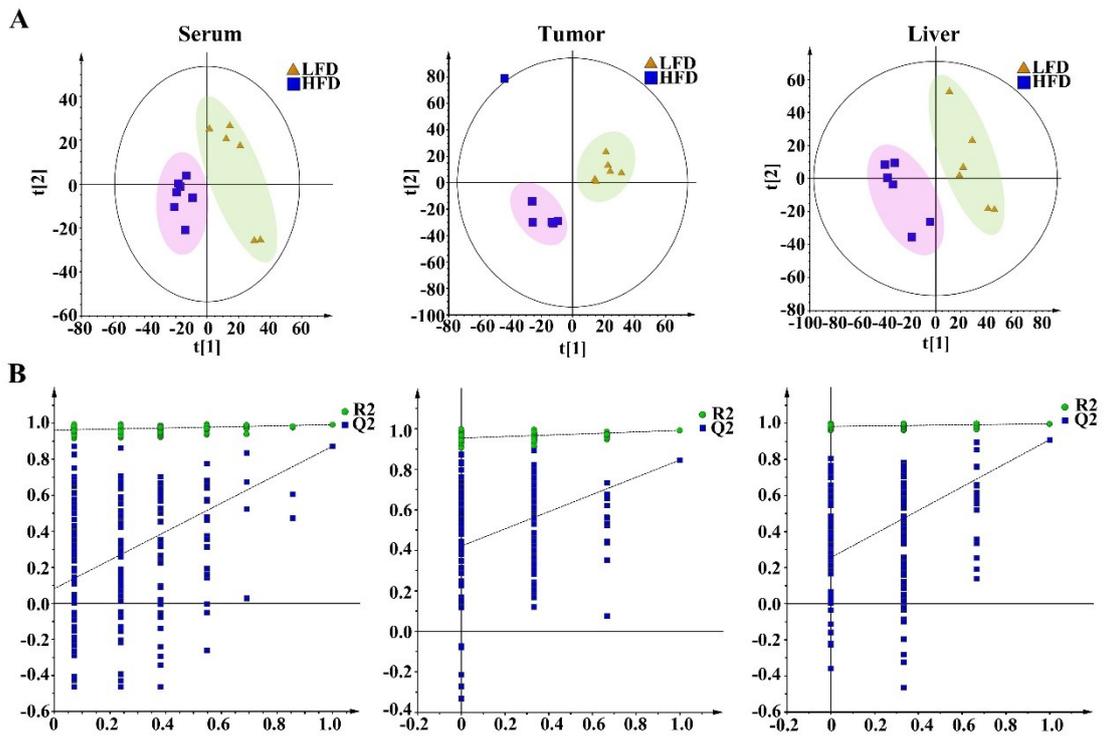

Fig. S4. PLS-DA score plots and permutation test evaluation in serum, tumor, and liver samples from HCT116 xenograft nude mice between the LFD and HFD groups. (A) PLS-DA score plots; (B) Permutation test.

Table S2 The differential metabolites in serum samples from HCT116 xenograft nude mice between the LFD and HFD groups.

--------------------------------------	-------------	-------	----------	------	-------	---

Name, differential metabolite name; VIP, the contribution rate of different substances to the OPLS-DA model; CompMW, the molecular weight of the compound; Time, retention time; *t*-test, significant values in *t*-test; Fold change, the value of the ratio of the mean value in high-fat diet group to low-fat diet group. ESI, electrospray ionization. “+” indicates positive ion mode; “-” indicates negative ion mode.

Table S3 The differential metabolites in tumor samples from HCT116 xenograft nude mice between the LFD and HFD groups.

Name, differential metabolite name; VIP, the contribution rate of different substances to the OPLS-DA Model; CompMW, the molecular weight of the compound; Time, retention time; *t*-test, significant values in *t*-test; Fold change, the value of the ratio of the mean value of high-fat diet group to low-fat diet group. ESI, electrospray ionization. “+” indicates positive ion mode; “-” indicates negative ion mode.

C

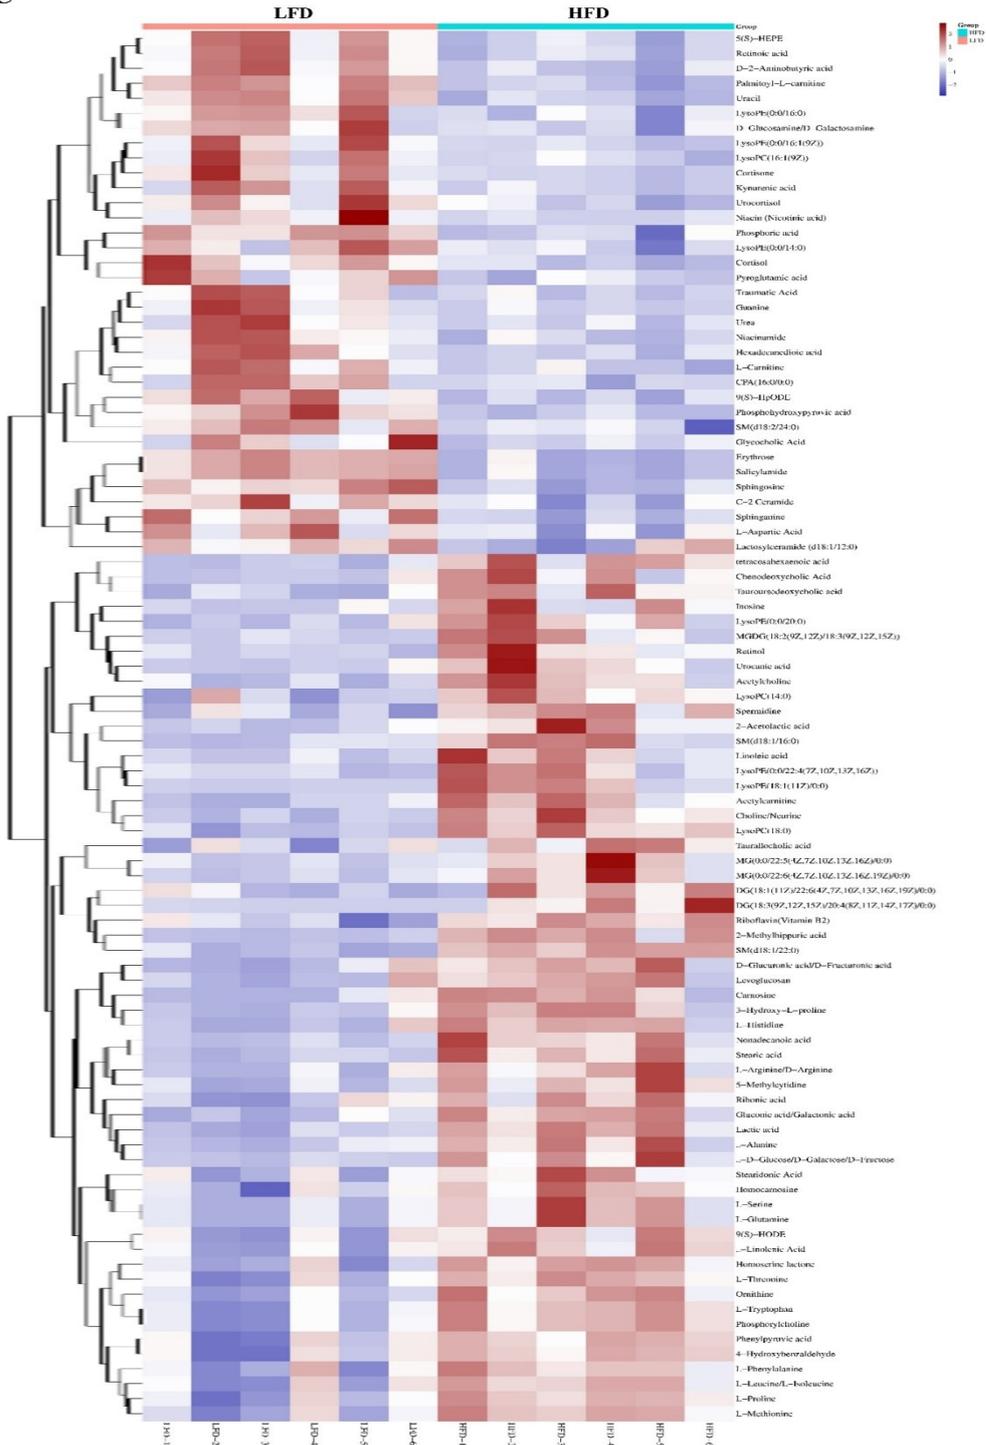

Fig. S5. The heatmap and relative abundances of the differential metabolites in serum, tumor, and liver. (A) Serum; (B) Tumor; (C) Liver. The more red colored, the higher the abundance of these metabolites, and the more blue colored, the lower the abundance of these metabolites.

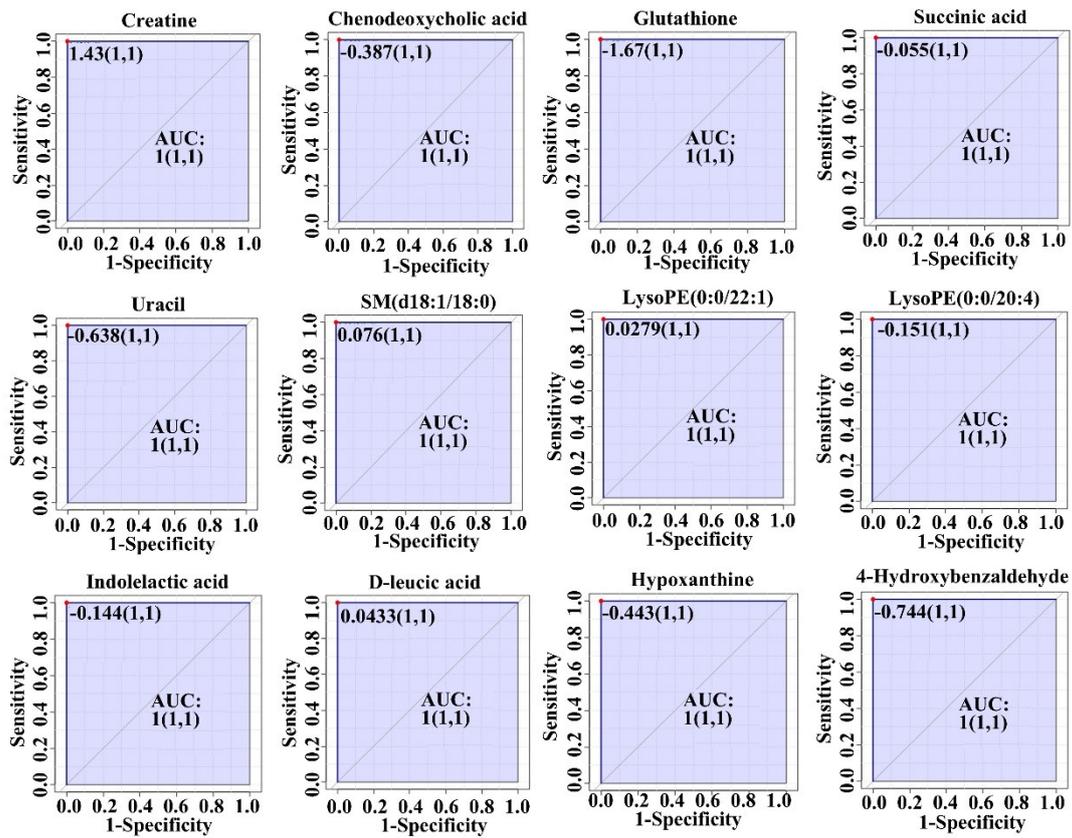

Fig. S6. Twelve potential metabolite biomarkers in tumors from HCT116 xenograft nude mice between LFD and HFD groups through univariate ROC curve analysis.
