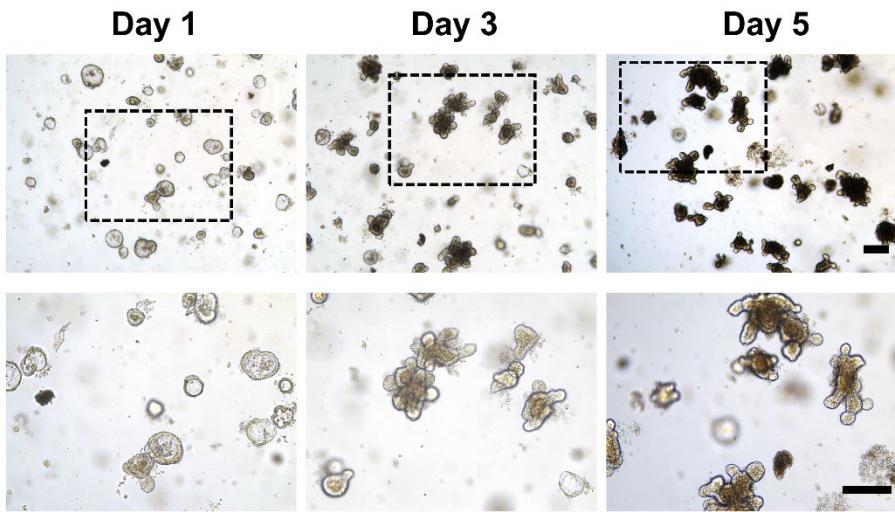

Fig. S1 The developmental process of the intestinal organoids at different times. Scale bars: 250 μm .

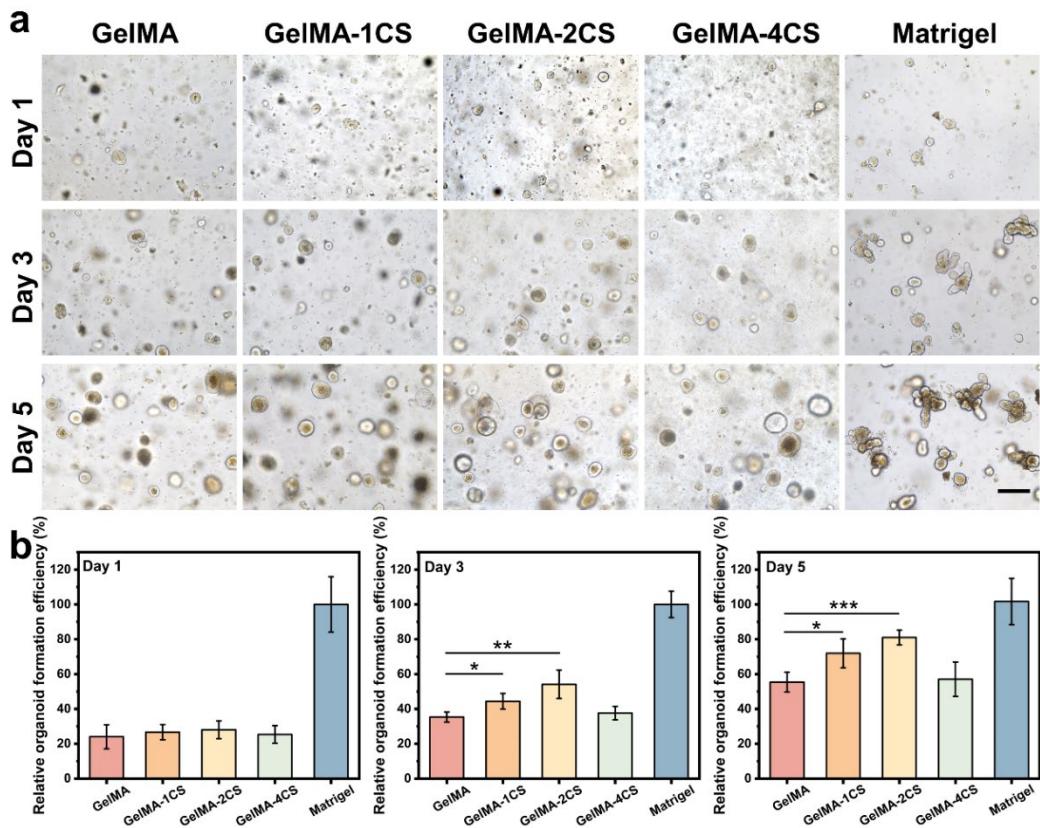

Fig. S2 (a) The optical microphotographs of the intestinal organoids grown in the CS/GelMA hydrogel with different content of CS nanowires for 1, 3, and 5 days. Scale bars: 250 μm . (b) Quantitative analysis of colony formation efficiency cultured in different CS/GelMA composite hydrogel for 1, 3, and 5 days ($n=4$). Data are presented as means \pm SD. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

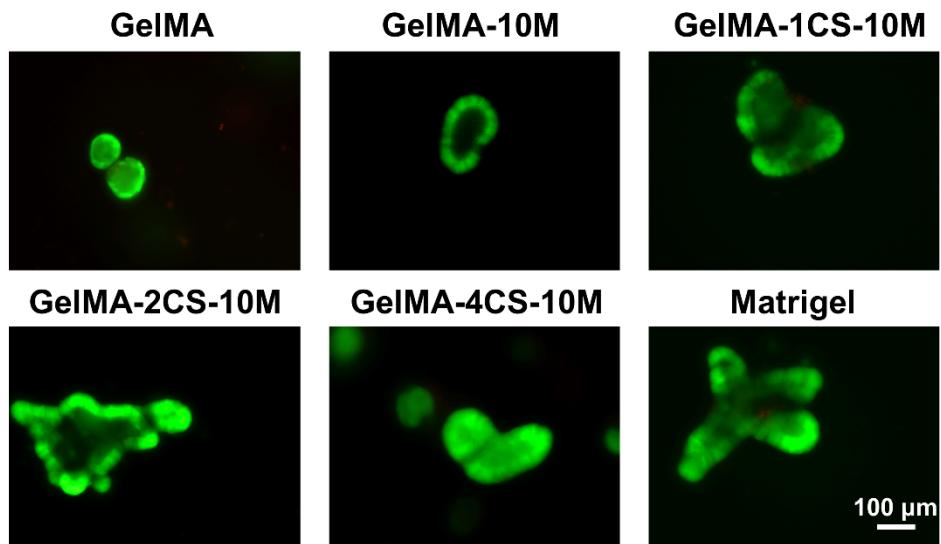

Fig. S3 The live/dead staining of intestinal organoids grown in different hydrogels.

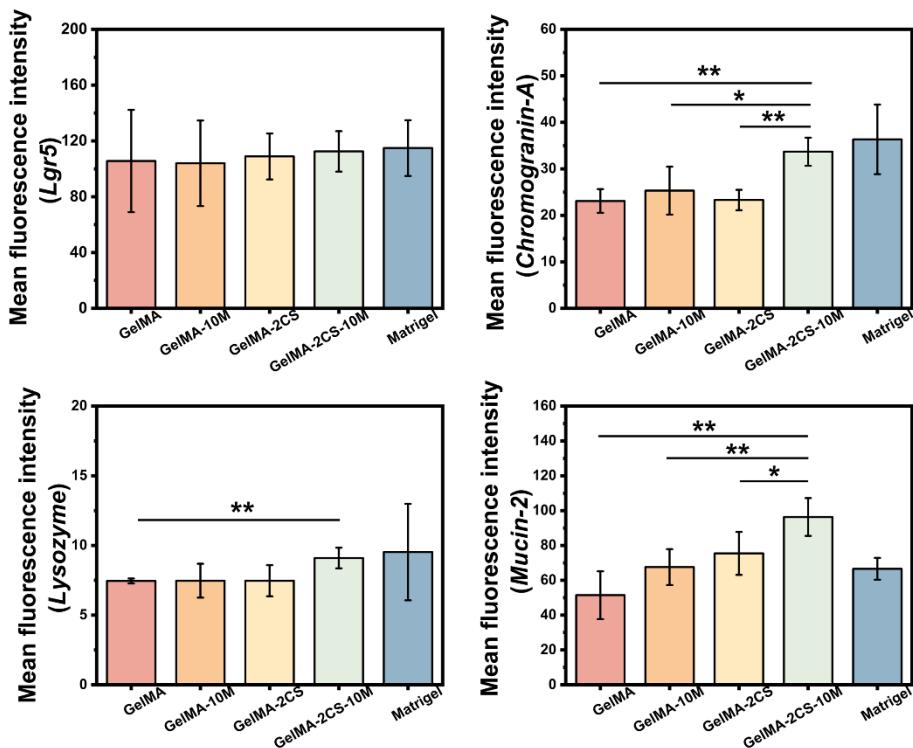

Fig. S4 The mean fluorescence intensity of four differentiated cell type markers in intestinal organoids grown in different hydrogels. Data are presented as means \pm SD. * $p < 0.05$, ** $p < 0.01$.

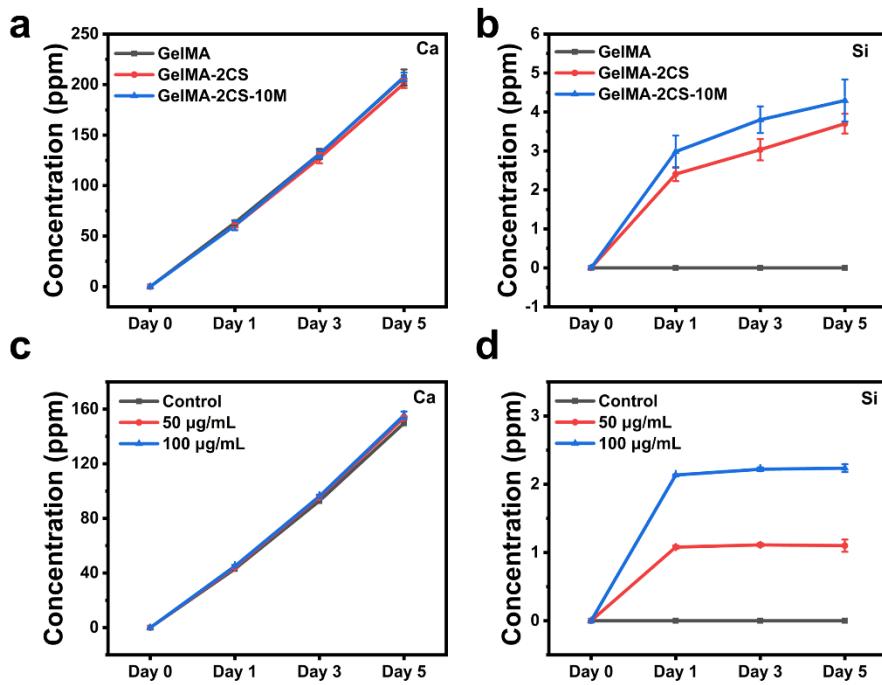

Fig. S5 The ions release of CS/GelMA hydrogel (a, b) and CS nanowires (c, d) soaked in DMEM/F12 medium for 1, 3, and 5 days, respectively.

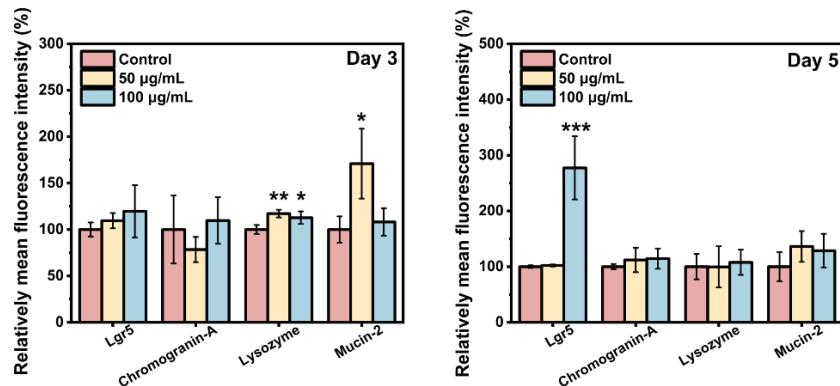

Fig. S6 The relatively mean fluorescence intensity of four differentiated cell types markers in intestinal organoids treated with 0, 50 µg/mL, and 100 µg/mL CS nanowires for 3 and 5 days. Data are presented as means \pm SD. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.
