1. General information

The chemicals isatin with purity 98% was purchased from Spectrochem, Mumbai and L-proline with purity 99% was purchased from Sisco Research Laboratories (SRL) Pvt. Ltd., Mumbai. The ionic liquid [Bmim]BF₄ with purity >98.0% was purchased from Tokyo Chemical Industry (TCI), Tokyo, Japan. All the acetophenones with purity 99% were purchased from Finar chemicals Ltd., Ahmedabad, India. Phenylhydrazine with purity 98% was purchased from AVRA synthesis Pvt. Ltd., Hyderabad, India. All the solvents were purchased from Merck chemicals, Mumbai. The compounds were used without further purification. All the melting points were determined by using Stuart SMP30 melting point apparatus (Bibby Scientific Ltd. United Kingdom) and were uncorrected. Ultrasonication irradiation was performed on PCi-Analytics-6.5L200H1DTC ultrasonic cleaner, the frequency of ultrasonic cleaner is 25 kHz, input voltage range of 170–270VAC at 50 Hz and output power is 250 W (Mumbai, India). The reaction progress was checked with TLC plates (E. Merck, Mumbai, India). IR spectra were recorded on KBr disc by using Perkin-Elmer 100S spectrophotometer (Perkin-Elmer Ltd. United Kingdom) from 400–4000 cm⁻¹ and Bruker spectrometer. ¹H and ¹³C NMR spectra were recorded on Avance-III Bruker-400 MHz spectrometer (Bruker Corporation Ltd., Germany) using DMSO-*d*6 and CDCl₃ as solvents and TMS as an internal standard, chemical shifts were expressed in ppm. Mass spectra were recorded on a Jeol JMSD-300 spectrometer (Jeol Ltd., Tokyo, Japan) in acetonitrile solvent. The single crystal X-ray diffraction data of the compound **4b** was collected and solved by using Bruker Kappa Apex II CCD diffractometer and ShelXT software. Molecular docking studies were performed by using AutoDock Tools-1.5.6 software and visualized by Discovery studio.

5. In-vitro *MTB* MABA assay

Briefly, the inoculum was prepared from fresh LJ medium re-suspended in 7H9-S medium (7H9 broth, 0.1% casitone, 0.5% glycerol, supplemented oleic acid, albumin, dextrose, and catalase [OADC]), adjusted to a OD₅₉₀ 1.0, and diluted 1:20; 100 µl was used as inoculum. Each drug stock solution was thawed and diluted in 7H9-S at four-fold the final highest concentration tested. Serial two-fold dilutions of each drug were prepared directly in a sterile 96-well microtiter plate using 100 µl 7H9-S. A growth control containing no antibiotic and a sterile control were also prepared on each plate. Sterile water was added to all perimetre wells to avoid evaporation during the incubation. The plate was covered, sealed in plastic bags and incubated at 37°C in normal atmosphere. After 7 days incubation, 30 µl of alamar blue solution was added to each well, and the plate was re-incubated overnight. A change in colour from blue (oxidised state) to pink (reduced) indicated the growth of bacteria, and the MIC was defined as the lowest concentration of drug that prevented this change in colour.

6. Cytotoxicity, % of inhibition assay

Cytotoxicity was carried out in mouse macrophage cell line (RAW 264.7) at 25 µg/mL concentration. After 48 h of exposure, viability was assessed on the basis of cellular conversion of MTT into a formazan product using the cell proliferation assay. Cells were grown in RPMI medium supplemented with 10% fetal bovine serum (FBS), 10,000 units penicillin and 10 mg streptomycin per mL in T25 flasks to attain 80-90% confluency. Cells were scraped and seeded into wells approx 5,000 cells per well in poly-L-lysine coated plates. The microtiter plates were incubated at 37 °C, 5% CO₂ and 100% relative humidity for 24 h prior to addition of experimental drugs. The test compounds at 50 µg/mL concentrations were then added to cells and incubated at 37 °C for 48 h; later 10 µL of 0.5 mg/mL concentration of MTT was added and incubated for 3 h at 37 °C and the final product formazan crystals were measured at 595nm and 625nm.
