1 Generating the DNA+Aptamer Structure

To generate the aptamer, we attached the G-quadruplex (Figure S1 (a)) and 5'-TTTAA-3' (Figure S1 (b)) together. The two structures are connected through their backbone via the oxygen-carbon bond between O5' of Adenine (Res ID: A₈) and C5' of Guanine (Res ID: G₁), and O3' of Thymine (Res ID: T₁) and C3' of Guanine (Res ID: G₁₅) as shown in Figure S2. This was done in GaussView by first measuring the bond distance between O5' and C5' of G₁ which was found to be 1.42701 Å. Next, the TTTAA structure was manually added into the G-quadruplex and the O5' atom of G₁ was removed and replaced with the O5' of A₈, ensuring the distance between O5' of Adenine and C5' of Guanine matched the measured 1.42701 Å. The process was repeated between the 3'-end G₁₅ and T₁ of 5'-TTTAA-3'. The O3' of T₁ was connected to the C3' of G₁₅, with a measured bond distance of 1.42680 Å. The resulting sequence was then rearranged using a text editor to follow the order of 5'- A₁A₂A₃[Gquad]T₁₉T₂₀T₂₁A₂₂A₂₃-3' as shown in Figure S3. The resulting aptamer structure was then energy minimized in Amber in an implicit water solvent using the Born solvation model with the DNA.bsc1² force field. We employed maximum minimization cycles of

10000 steps, with the first 2000 steps using the steepest descent method, then followed by maximum of 8000 steps using the conjugate gradient algorithm.

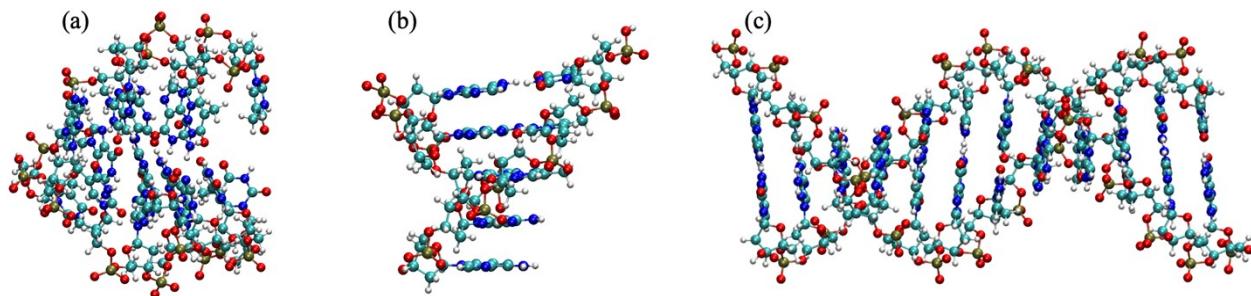

Figure S1 Snapshots of the three components of the DNA-aptamer components. (a) G-quadruplex; (b) ds-TTTAA sequence; and (c) 12-mer ds-DNA.

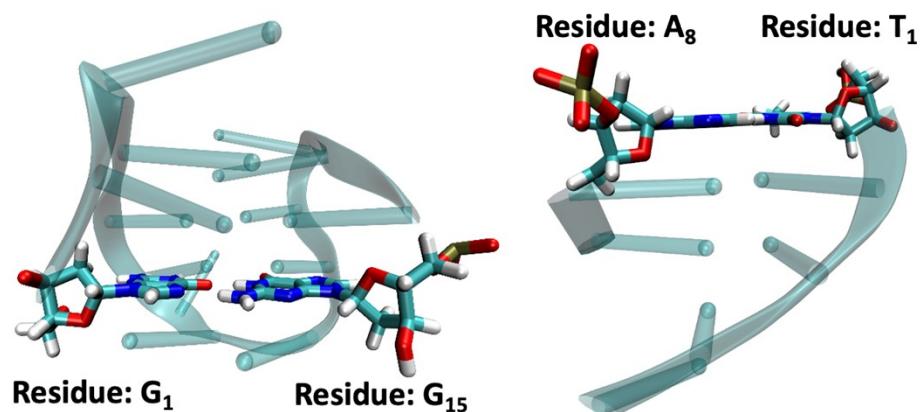

Figure S2 Residue IDs of the G-quadruplex and ds-TTTAA structures that are connected together to form the aptamer.

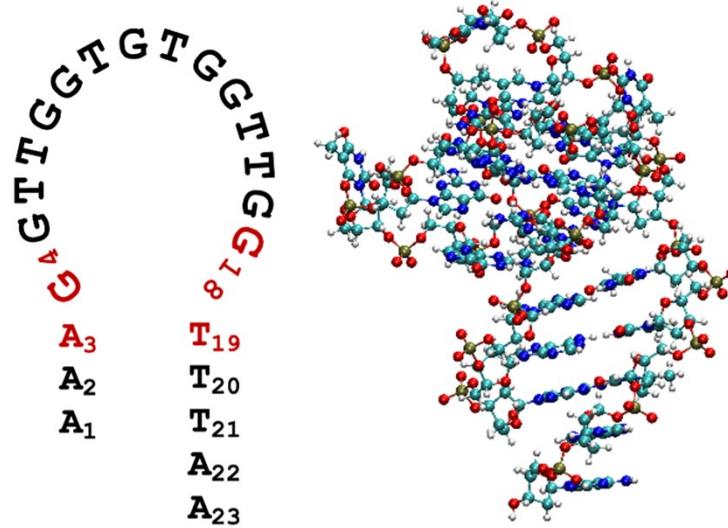

Figure S3 Illustration and snapshot showing the connected Gquad+TTTAA.

Next, the Aptamer was connected to the DsDNA via the O3' atom of Guanine (Res ID: G₈) and the Phosphate of Adenine A₁ at one end, and between O3' of adenine A₂₃ and the Phosphate of thymine T₉ at the other end (Figure S4). The operation required the following steps: 1) temporarily breaking the dsDNA into two blocks, 2) connecting the aptamer to each block via the backbone, 3) reordering the residues in the resulting PDB file to correspond to a one whole structure DNA+aptamer. In step 1, to fit the Gquad+TTTAA ends to the DsDNA, the DNA was temporarily divided into two blocks as shown in Figure S4, by removing the bond between O3' of G₈ and the phosphate of thymine (Res ID: T₉) as well as the bond between O3' of adenine (Res ID: A₄) and the phosphate of cytosine (Res ID: C₅), noting the distances.

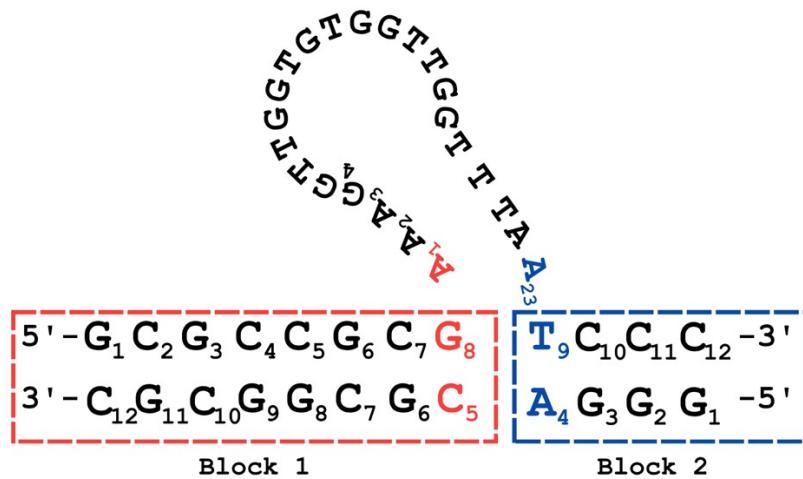

Figure S4 Illustration showing the separation of the 12-mer DsDNA into blocks with the aptamer positioned above guanine (G₈) and thymine (T₉).

The aptamer structure was then imported into the ds-DNA PDB file, and manually positioned so that the ends of TTTAA (Res IDs: A₁, A₂₃) were above G₈ and T₉ as shown in Figure S5. Alignment and connection

to Block 1 involved orienting the 5' adenine (A_1) of the Gquad+TTTAA structure above G_8 of the ds-DNA, adjusting the structure to avoid overlap, and using the “modify bond” tool to match the bond distance between O3' of guanine and the phosphate of adenine to the measured value. Similarly, Block 2 was connected by aligning the 3' end of TTTAA with T_9 , tilting and shifting the blocks to maintain proper distances. After finalizing the connections, the bonds between blocks 1 and 2 in the complementary strand were restored. The PDB file was then reordered to yield a final sequence of 5'- $G_1 C_2 G_3 C_4 C_5 G_6 C_7 G_8$ [Gquad+TTTAA] $T_{32} C_{33} C_{34} C_{35} G_{36} G_{37} G_{38} A_{39} C_{40} G_{41} C_{42} G_{43} G_{44} C_{45} G_{46} C_{47}$, as shown in Figure S6.

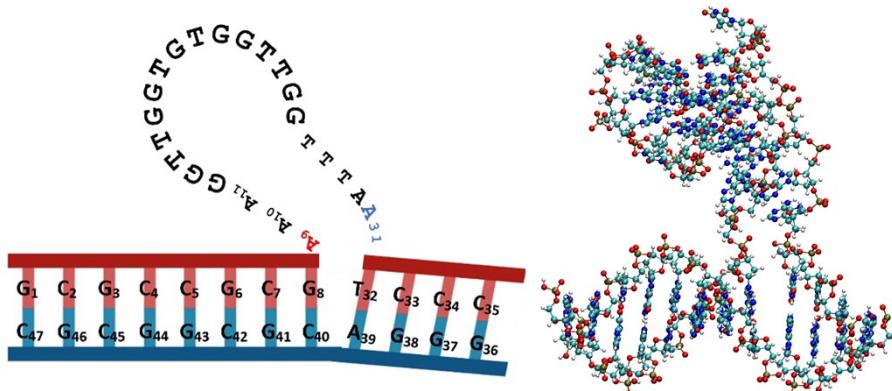

Figure S6 Illustration and snapshot showing the final dsDNA+aptamer structure, total sequence is 5'- $G_1 C_2 G_3 C_4 C_5 G_6 C_7 G_8$ [Gquad+TTTAA] $T_{32} C_{33} C_{34} C_{35} G_{36} G_{37} G_{38} A_{39} C_{40} G_{41} C_{42} G_{43} G_{44} C_{45} G_{46} C_{47}-3'$.

2 MD RMSD Clustering and Additional Plots

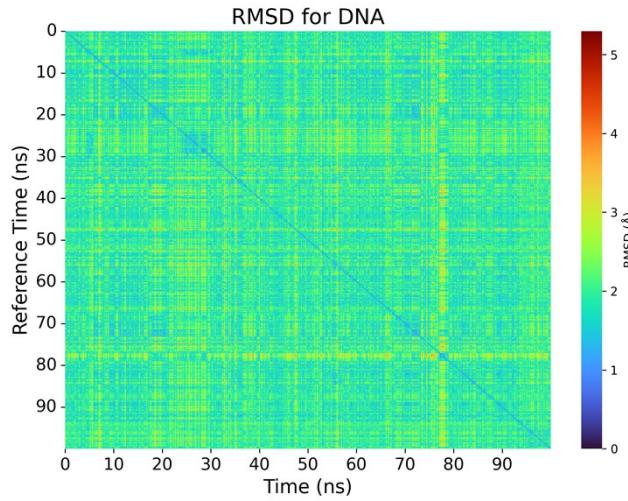

Figure S7 RMSD plot of the simulation frames for dsDNA structure within the 100 ns MD simulation used for clustering the conformations.

Table S1 Clusters conformations of ds-DNA

Clusters	Frames	Percentage
C1	90917	90.9%
C2	2941	2.94%
C3	2761	2.76%
C4	1618	1.6%
C5	1031	1.03%
None	750	0.75%

Table S2 Clusters conformations of DNA+aptamer

Clusters	Frames	Percentage
C1	68309	68.3%
C2	14788	14.79%
C3	10809	10.8%
C4	2590	2.59%
C5	1961	1.96%
None	1543	1.54%

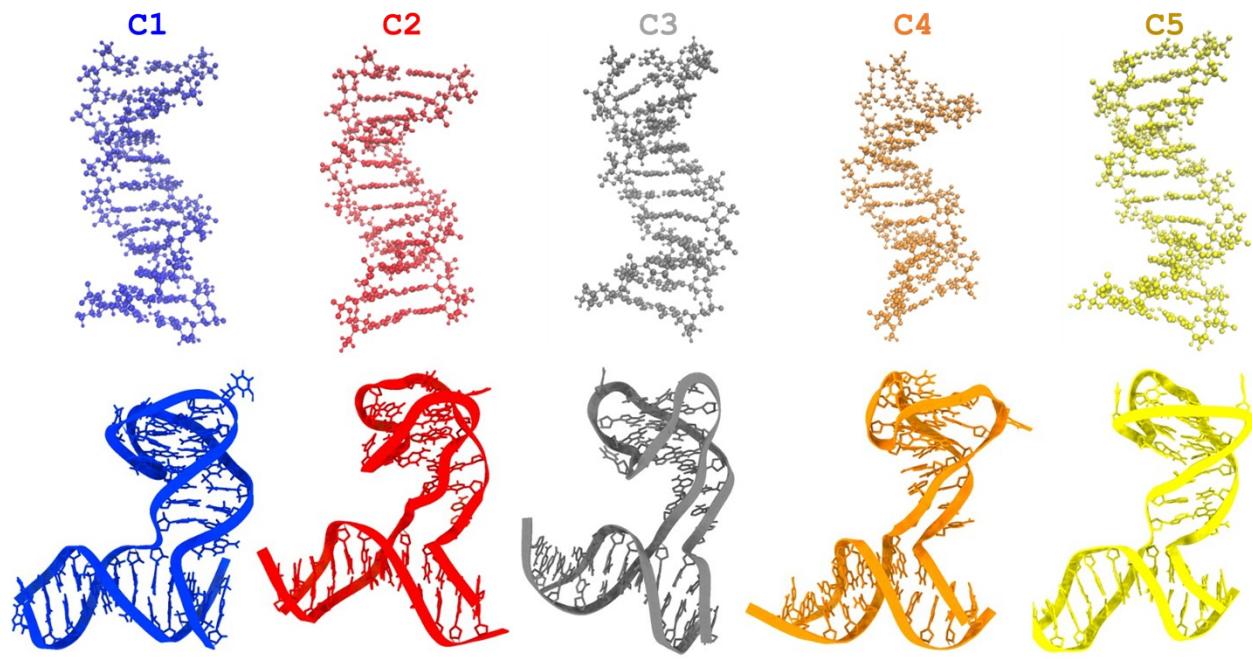

Figure S8 Conformation clusters for dsDNA (top row) and DNA+aptamer (bottom row).

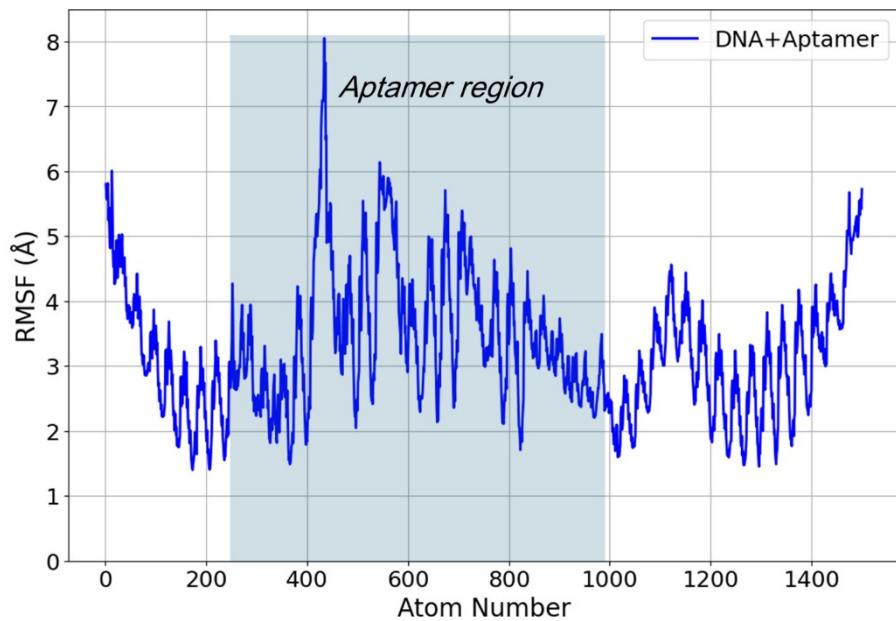

Figure S9 RMSF of the whole dsAPT structure.

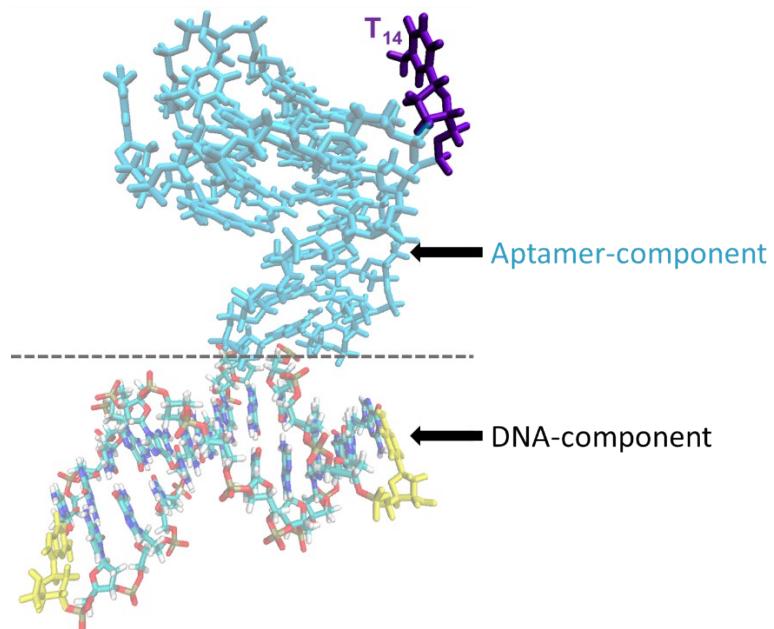

Figure S10 DNA+Aptamer, the thymine T_{14} (violet color) with the high RMSF is shown in violet. The dashed line is an eye guide to separate the aptamer- and DNA-components of the dsAPT structure.

3 Additional DOS Plots

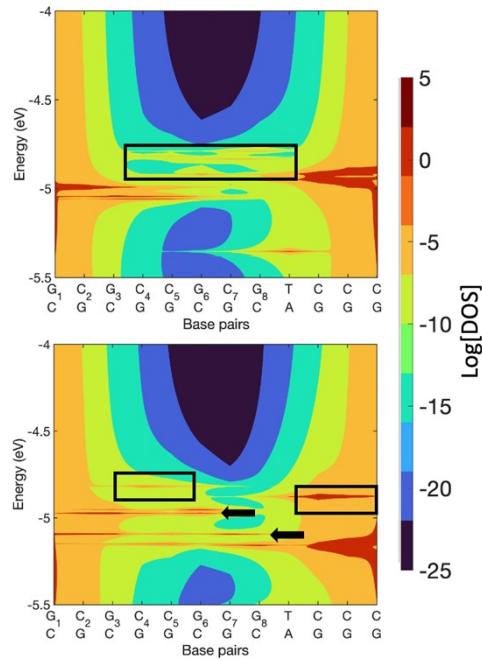

Figure S11 2D DOS plot of dsAPT and dsDNA without including decoherence broadening in the calculations. The localized DOS of the Aptamer was omitted for clarity. The black blocks highlight the molecular orbitals within -4.8 eV and -4.9 eV. The black arrows highlight the MOs of the G₆C₇G₈ segment.

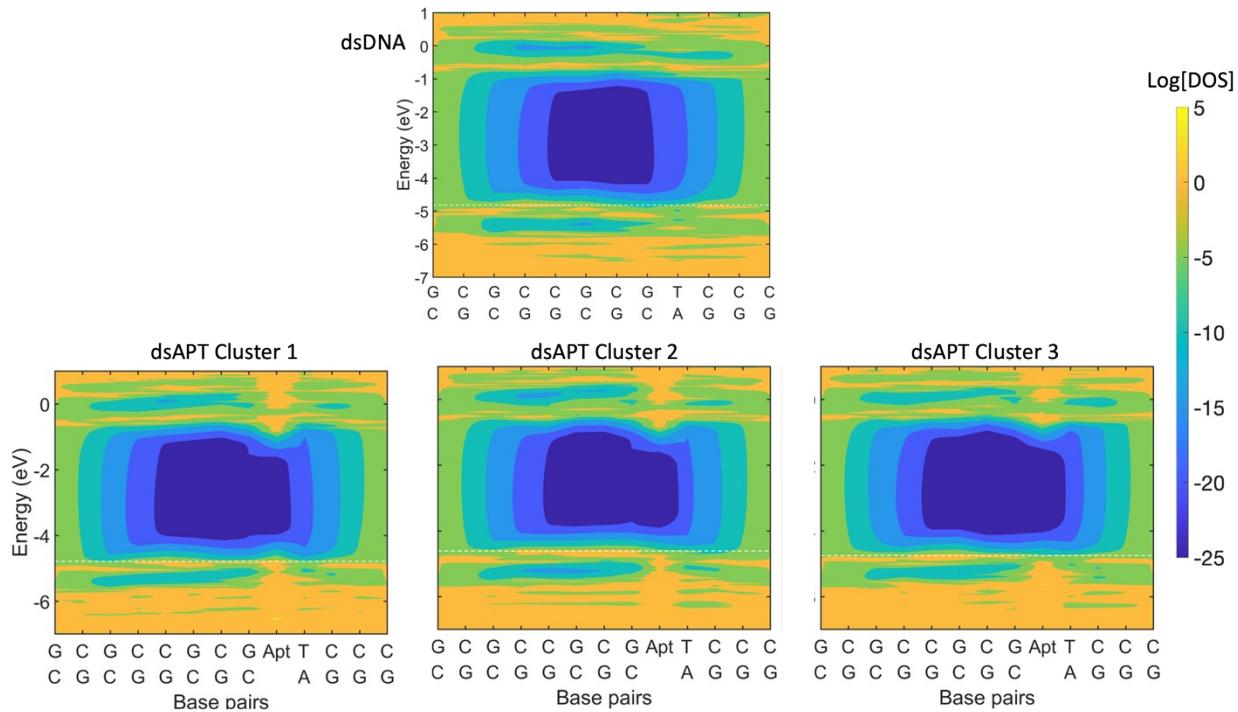

Figure S12 Overall 2D DOS plots for all structures including the aptamer, extending from HOMO region into LUMO region.

4 Transmission and Conductance with textbook B-DNA and Clusters 2 and 3 of dsAPT

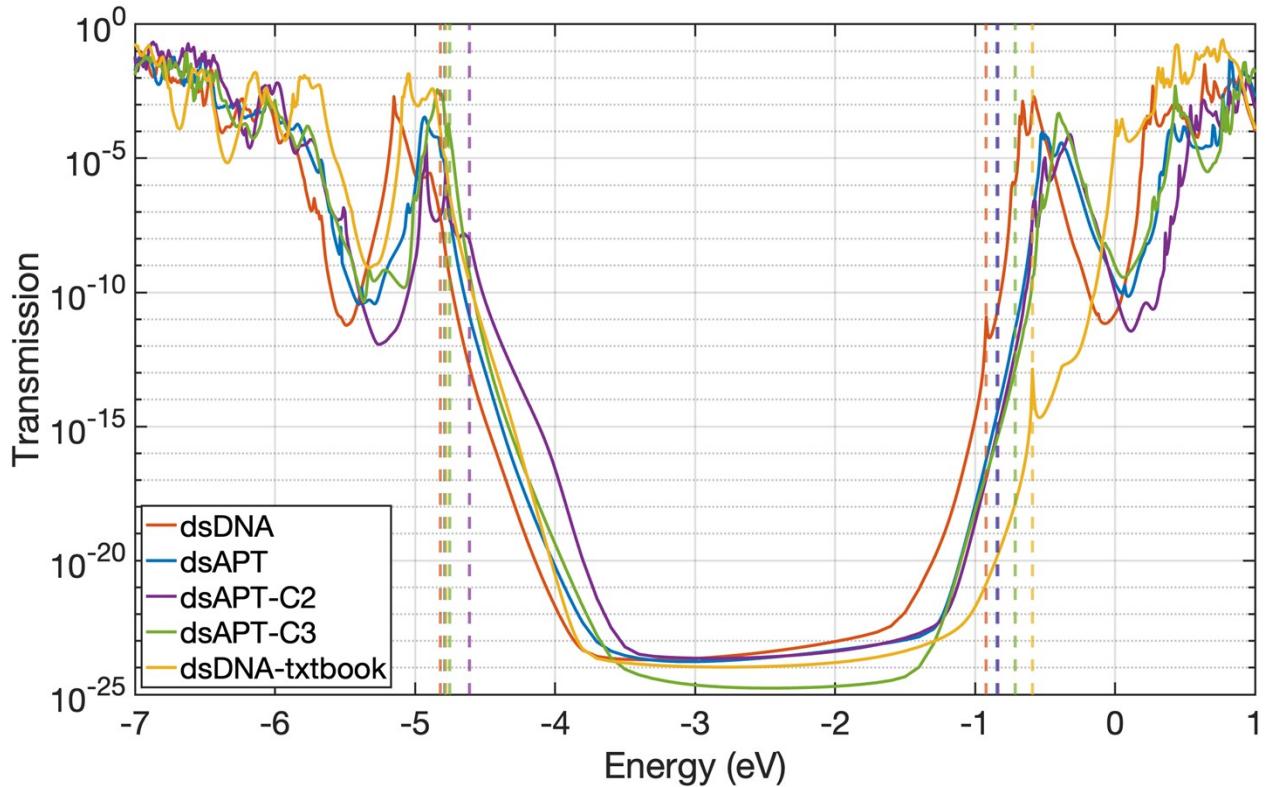

Figure S13 Transmission plots including textbook B-DNA, dsAPT cluster 2, and cluster 3.

We notice that the transmission and conductance of dsAPT-cluster 2 is lower than dsDNA. The reason can be understood from the resulting MOs distribution, which is shown in the 2D DOS plot Figure. Although the G₆C₇G₈ segment still contains delocalized DOS near HOMO, the conformation of cluster 2 resulted in DOS at the contact sites (terminal base-pairs) to be at much lower energy, which is inaccessible to the DOS on the G₆C₇G₈ segment. Thus, hindering the transmission and lowering the conductance at energy \sim HOMO. The other clusters always have high DOS regions on either contact side at energy \sim HOMO, which create a conductive path along the DOS on the G₆C₇G₈ segment.

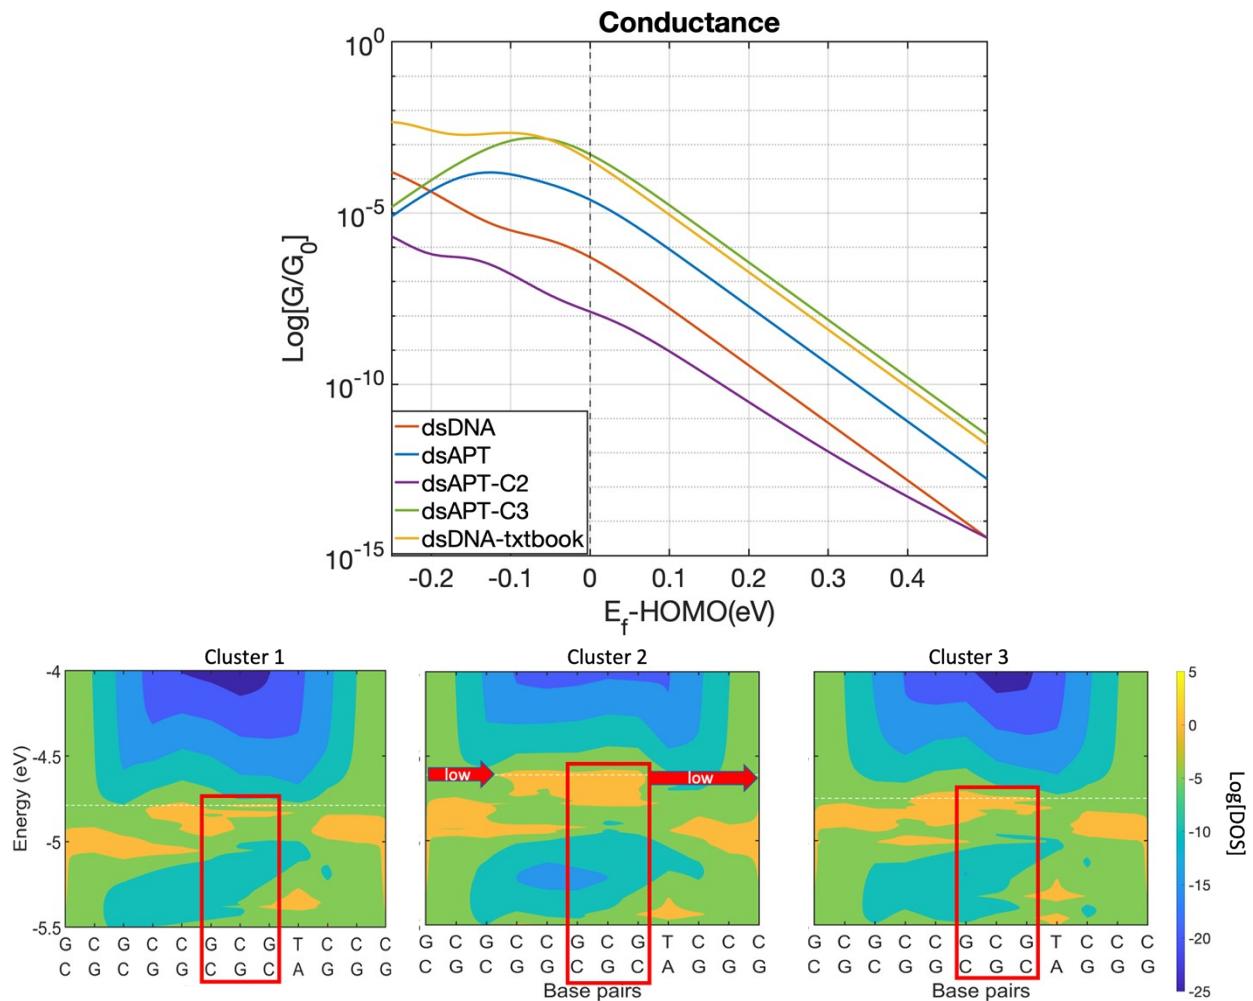

Figure S14 **Top** conductance plots. **Bottom:** Zoom-In of DOS at the HOMO edge for clusters 1,2, and 3 of dsAPT.

5 Structural Analysis Including Clusters 2 and 3

The same trends, observations, and conclusions are applicable to cluster 2 and cluster 3 of the dsAPT structure.

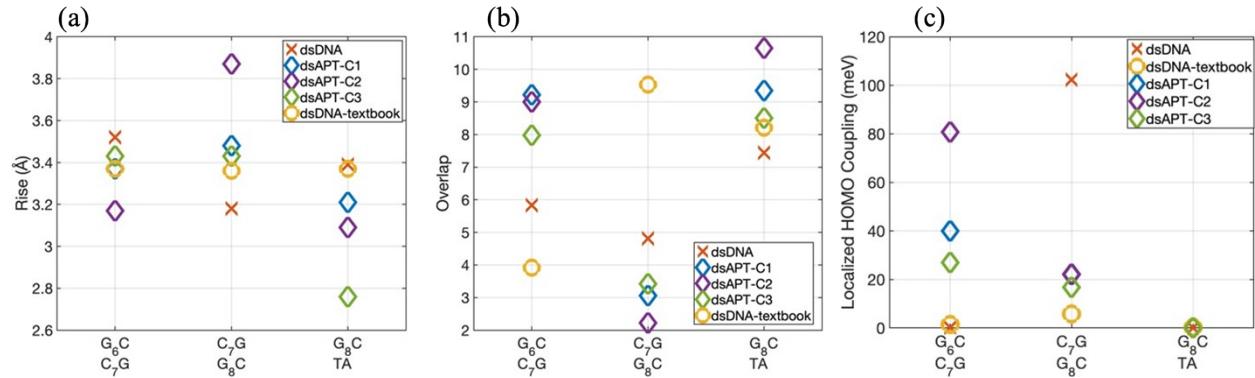

Figure S15 Rise, overlap, and localized HOMO coupling plots between the nearest neighboring base-pairs G₆C-G₈T, respectively, including clusters 2 and 3 of dsAPT.

6 Minimizing the Centroid Prior to DFT

Performing DFT calculations on structures resulting from MD simulations can encounter difficulties in convergence. From our experience, we had previous difficulties with getting convergence if we would take the centroid (or a snapshot) without minimization and run DFT calculations. That is because of the large bond lengths that could be present in the unminimized structure. However, in this case for dsAPT, we ran the calculation on the centroid of cluster 1 without prior minimization and the calculations did converge. In Figure S16 below, we show the comparison of the calculated transmission and conductance for the same structure with and without the minimization step prior to the DFT. We notice that the results are very similar. Therefore, we anticipate the trade-off between minimizing the structure to ensure DFT convergence and sacrificing some of the detailed features from MD will be justifiable.

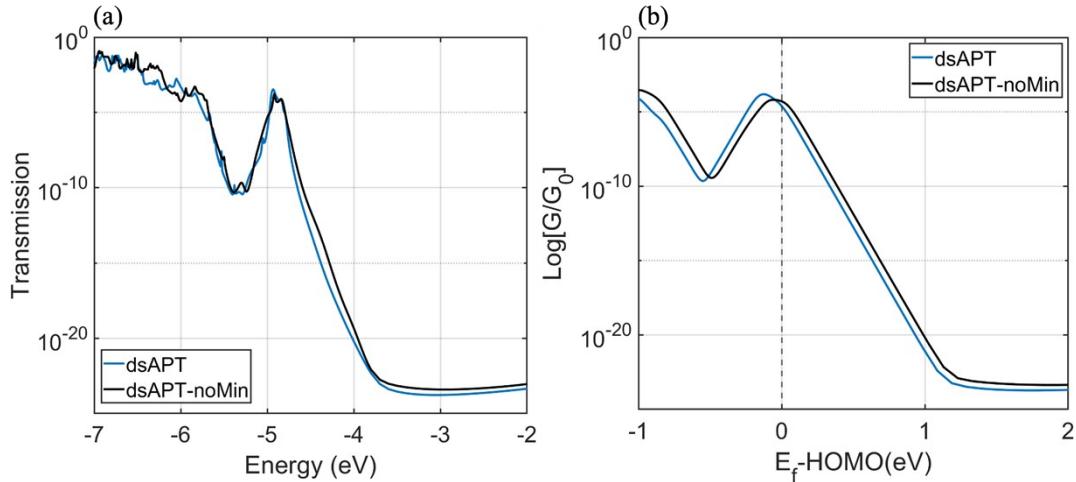

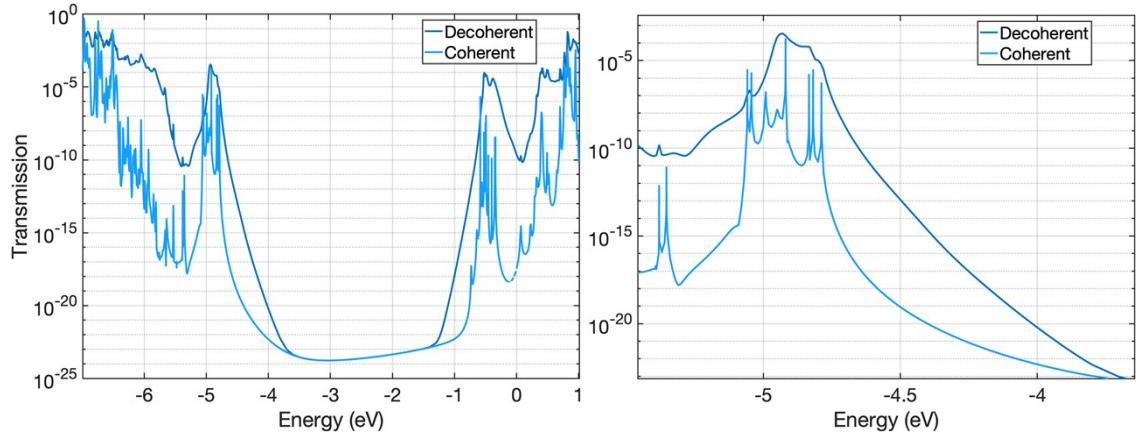

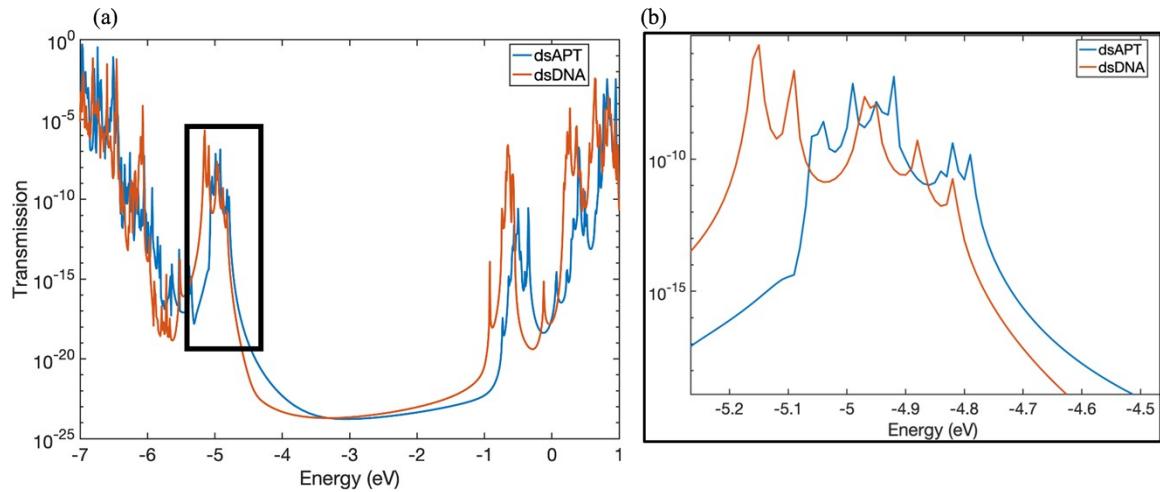

Figure S16 (a) Transmission of dsAPT cluster 1 centroid with and without the minimization step prior to DFT. (b) conductance plot of the same structures.

7 Coherent Transport

We note that the main difference between coherent and decoherent transport appears in the resonant and off-resonant transmission. The plot in Figure S18 shows that the coherent transmission has very sharp resonant peaks compared to decoherence case. However, the off-resonant transmission is orders of magnitude lower than the decoherent case.
