1. General information

Unless otherwise stated, all commercial reagents were used without additional purification. Column chromatography was undertaken on silica gel (200-300 mesh) using a proper eluent system. ¹H NMR, ¹⁹F NMR, and ¹³C NMR spectra were recorded on a spectrometer at 400, 376 and 101 MHz, respectively, with deuterated chloroform as solvent. The chemical shifts δ are reported in ppm relative to tetramethylsilane (δ = 0 ppm) or residual CHCl₃ (δ = 77.00 ppm). The following abbreviations were used to describe peak splitting patterns when appropriate: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), dd (doublet of doublet), td (triplet of doublet). Coupling constants J are reported in Hertz (Hz). High-resolution mass spectrometry (HRMS) was performed on a Q-TOF spectrometer using electrospray ionization (ESI). The imidazo[1,2-a]pyridines¹-³ and N-amidopyridinium salts⁴-⁶ were prepared according to references.

2. Preparation of Starting Materials
Synthesis of Substrates 1

Procedure A (1a-1o, 1q-1ag, 1ai):

\[
\begin{align*}
\text{N} &\text{H}2 + \text{R}2\text{O} \text{Br} \xrightarrow{\text{NaHCO}_3, \text{EtOH}} \text{R}1\text{N} \text{H}2 \text{R}1 \text{N} \text{H}2 \\
\end{align*}
\]

A round-bottom flask equipped with a magnetic stir bar was charged with 2-aminopyridine (1.3 equiv.), the corresponding \( \alpha \)-bromo-ketones (1.0 equiv.), and \( \text{NaHCO}_3 \) (1.5 equiv.). EtOH was then added, and the resulting solution was stirred at room temperature for 6 h. After the completion of the reaction, the resulting mixture was diluted with water and extracted with ethyl acetate (three times). The combined organic layers were dried over anhydrous \( \text{Na}_2\text{SO}_4 \) and concentrated under reduced pressure to give the crude product. The crude product was purified by column chromatography on silica gel with petroleum ether/EtOAc as eluent to afford pure product.

Procedure B (1p, 1ah):

\[
\begin{align*}
\text{N} &\text{H}2 + \text{R} \text{O} \xrightarrow{\text{CuI, dioxane, 100 °C}} \text{R} \text{N} \text{H}2 \text{R} \text{N} \\
\end{align*}
\]

A round-bottom flask equipped with a magnetic stir bar was charged with 2-aminopyridines (1.2 equiv.), the corresponding \( \alpha \)-bromo-ketones (1.0 equiv.), CuI (0.2 equiv.). Dioxane was then added, and the resulting solution was stirred at 100 °C under air for 14 h. After the completion of the reaction, the reaction solvent was concentrated under reduced pressure to give the crude product, which was purified by column chromatography on silica gel with petroleum ether/EtOAc as eluent to afford pure product.

Synthesis of Substrates 2

Procedure A:

\[
\begin{align*}
\text{R} &\text{NHNH}_2 + \text{O} \text{BF}_4^- \xrightarrow{\text{rt, 12h, EtOH}} \text{R} \text{N} \text{H}2 \text{BF}_4^- \\
\end{align*}
\]

To a solution of 2,4,6-Trimethylpyrylium tetrafluoroborate (1.0 equiv.) in ethanol was added hydrazine (1.0 equiv.). The reaction mixture was stirred at room temperature for 12 h. The mixture was cooled to 0 °C and petroleum ether was added. The precipitate was collected, washed with EtzO and dried to give products 2.

Procedure B:
**Step 1:** To a solution of 1-aminopyridinium iodide (1.0 equiv.) and distilled-CH$_3$CN (0.13 M) were added DMAP (10 mol%), K$_2$CO$_3$ (3.6 equiv.) and sulfonamide chloride (1.0 equiv.) at 0 °C (ice water bath) under N$_2$. Then, the cooling bath was removed and the reaction mixture was stirred at room temperature for 6 h. The suspension was filtered and concentrated in vacuo. The residue was suspended in DCM and filtered to remove inorganic impurities. After the solvent was removed under reduced pressure, the crude product was purified by column chromatography on silica gel with DCM/MeOH as eluent to afford pure product.

**Step 2:** The obtained ylide was dissolved in DCM (0.3 M) and tetrafluoroboric acid solution (40 wt.% in H$_2$O) (1.3 equiv.) was added to the solution at room temperature. The reaction mixture was stirred for 30 min, then the product was precipitated with Et$_2$O. The resulting precipitate was filtered off, washed with Et$_2$O and dried under vacuum.

3. **General procedure for N-(2-phenylimidazo[1,2-a]pyridin-3-yl)acetamide**

Under Ar atmosphere, a reaction tube (25 mL) equipped with a magnetic stirrer bar was charged with imidazo[1,2-a]pyridine (1, 0.2 mmol), N-amidopyridinium salts (2, 0.24 mmol), 4CzIPN (0.014 mmol, 7 mol%), Et$_3$N (0.24 mmol), and DMSO (1.0 mL). The reaction mixture was stirred with a 9 W blue LEDs irradiation at room temperature for 36 h. The resulting mixture was diluted with water (10 mL) and extract with EtOAc (10 mL). The combined organic layer was dried with anhydrous MgSO$_4$. After removal of EtOAc under vacuum, the residue was purified by chromatography on silica gel (eluent: EA/PE) to give the desired product 3.

4. **Radical-trapping experiment**

Two equivalents of radical scavenger TEMPO (2,2,6,6-tetramethylpiperidinoxy), DPE (1,1-diphenylethylene) or BHT (butylated hydroxytoluene) was added to the reaction of 1a with 2a in the standard conditions. After 36 h, the reaction mixture was cooled to room temperature. The crude reaction mixture was detected by HRMS or GC-MS.

5. **Luminescence Quenching Experiments**

Emission intensities were recorded using an Edinburgh UK FLS100 photoluminescence spectrometer from 400 nm to 800 nm. After irradiation of 5 × 10-5M of 4CzIPN and different concentration of quencher in solvent (CH$_2$Cl$_2$) at 375 nm,
its fluorescence was measured.

As shown in Figures S1-S3, the emission intensity of the excited state of photocatalyst 4CzIPN is decreased in the presence of 2a or Et3N. In contrast, when solutions of 1a have been employed, no fluorescence quenching has been observed. The liner relationship between I0/I and the different concentration of 1a, 2a, Et3N was shown in Figure S4.

**Figure S1.** Fluorescence quenching of 4CzIPN with 1a.
**Figure S2.** Fluorescence quenching of 4CzIPN with 2a.

**Figure S3.** Fluorescence quenching of 4CzIPN with Et$_3$N.
