2 General

Unless otherwise noted all solvents and chemicals were used as received. Solvents used for synthesis were HPLC grade. Anhydrous solvents were taken from an Innovative Technology (IT) apparatus (model PS-MD-05). Sodium iodide was dried by moderate heating under reduced pressure. The 2,6-lutidine used was stored over 3Å molecular sieves for at least 24 hours prior to use. For all reactions in which anhydrous solvents were used the glassware was flame dried prior to use and were carried out under N₂ atmosphere unless stated otherwise.

TLC was carried out on aluminium plates pre-coated with Silicagel 60 with fluorescence indicator, visualized by irradiation with UV light (254 nm) and/or H₂SO₄ stain (10% in EtOH) stain. Flash Column Chromatography was carried out using silica gel 60 (40-63 μm) as solid phase. Automated column chromatography was carried out on a Büchi Pure C-815 Flash instrument using Büchi FlashPure columns, loading was done by liquid injection with CH₂Cl₂, eluent gradients were calculated using the instrument Navigator function by inputting TLC data and column size.

¹H NMR and ¹³C NMR spectra were recorded on a 500 MHz Bruker instrument with a non-inverse cryoprobe at 298 K unless notes otherwise. Chemical shifts are reported in ppm and coupling constants (J) are reported in Hz. Residual protonated solvent signals were used as internal standards for referencing ¹H and ¹³C NMR spectra (¹H: δ(CHCl₃) = 7.26 ppm (singlet), δ(HDO) = 4.79 ppm (singlet), δ(CHD₂CN) = 1.94 ppm (pentet), and ¹³C: δ(CDCl₃) = 77.16 ppm (triplet), δ(CD₃CN) = 1.32 ppm (septet)). ¹H and ¹³C NMR assignments were based on 2D ¹H-¹H COSY and 2D ¹H-¹³C HSQC NMR experiments, aromatic carbon atoms were not assigned. The colors in ¹H-¹³C HSQC spectra indicate even (blue) and odd (red) numbers of hydrogen atoms attached to a carbon atom. Tetramethylsilane was used as internal standard for referencing ²⁹Si NMR spectra (²⁹Si: δ(Me₄Si) = 0 ppm).

HR-MS (MALDI-TOF) was run on a SolariX ESI/MALDI FTMS spectrometer using dithranol as matrix.

Phenyl β-α-thioglucopyranoside (S3)

β-α-glucopyranose pentaacetate S1 (14.98 g, 38.37 mmol, 1 equiv) was dissolved in anhydrous CH₂Cl₂ (40 ml) to which PhSH (4.80 ml, 46.6 mmol, 1.2 equiv) was added while stirring at 0 °C (ice bath). Then BF₃•OEt₂ (5.70 ml, 46.2 mmol, 1.2 equiv) was added in small portions over the course of 15 minutes followed by stirring at rt for 3.5 hours. Then the reaction was quenched by addition of sat. aqueous NaHCO₃ (30 ml). The organic phase was washed with H₂O (2 x 30 ml) and brine (1 x 30 ml) and afterwards dried over Na₂SO₄, filtered and concentrated in vacuo. The mixture was dissolved in PhMe and CH₂Cl₂ and loaded onto a silica plug. The plug was flushed with PhMe until no more PhSH eluted, then pure EtOAc was used to elute the acetylated thioglucopyranoside S2. After concentrating in vacuo, the sticky white solid was suspended in MeOH (150 ml) and NaOMe (25% in MeOH, 0.50 ml) was added, and the reaction was stirred at rt for 2 hours. The reaction was quenched upon the addition of solid phase acid resin (Amberlite IRC120 H⁺ form). The mixture was filtered and concentrated in vacuo to yield S3 as a white foam (9.236 g, 33.9 mmol, 88% over 2 steps).

Phenyl 4,6-O-benzylidene-β-D-thioglucopyranoside (S4)

To a solution of S3 (9.084 g, 33.36 mmol, 1 equiv) in anhydrous DMF (40 ml) was added a small amount of solid phase acid resin (Amberlite IR 120 H+ form). Then Benzaldehyde dimethyl acetal (5.70 ml, 37.8 mmol, 1.1 equiv) was added at rt and the reaction was stirred for 23 hours after which TLC analysis showed presence of starting material. Then more benzaldehyde dimethyl acetal (5.0 ml, 33 mmol, 1 equiv) and solid phase acid resin was added, and the reaction stirred at rt for another 24 hours. TLC analysis still showed low conversion so more benzaldehyde dimethyl acetal (3.0 ml, 20 mmol, 0.6 equiv) was added. After 2.5 days solid phase acid resin (Amberlite IR 120 H+ form, freshly acidified by washing with 1M HCl followed by washing with MeOH) was added and the reaction was stirred at rt. After a total of 4 days the reaction was quenched by the addition of Et$_3$N (1 ml, 7 mmol) until pH > 7 and the mixture was filtered to remove resin beads. The mixture was diluted with H$_2$O (100 ml) and extracted with EtOAc (4 x 50 ml). The combined organic phases were washed with H$_2$O (3 x 40 ml), aqueous HCl (1M, 1 x 40 ml) and brine (2 x 40 ml). The organic phase was dried over Na$_2$SO$_4$, filtered, and concentrated in vacuo. The crude mixture was suspended on Celite filter aid and purified by flash column chromatography (1:1 EtOAc/heptane) and further purification of the product-containing fractions by trituration in EtOAc (200 ml) with petroleum ether (700 ml) yielded S4 as a white powdery solid (1.723 g, 4.78 mmol, 14%).
