Experimental Section

Materials.

Poly(ethylene glycol) methyl ether acrylate [PEGA: CH₂=CHCO₂(CH₂CH₂O)_nMe, M_n = 480 g/mol, n = 9.0 on average, TCI] and dodecyl acrylate (DA, TCI, purity >98%) were purified by an inhibitor removal column (Aldrich) and degassed by triple vacuum-argon purge cycles before use. 2-Naphthylmethyl acrylate (NpA) and 1-pyrenylmethyl acrylate (PyA) were prepared as shown below. Dodecyl vinyl ether (DVE, Aldrich, purity >98%) was degassed by argon bubbling before use. Tetralin (1,2,3,4-tetrahydronaphthalene: TCI; purity >98%; an internal standard for ¹H NMR analysis) and triethylamine (TCI, purity >99%) were dried overnight over calcium chloride and distilled from calcium hydride under reduced pressure before use. 2,2'-Azobis(isobutyronitrile) (AIBN, TCI, purity >98%) was degassed by triple vacuum-argon purge cycles before use. Toluene (Wako, deoxidized), methanol (Wako), distilled water (Wako), ultrapure Water (Wako), acetone (Wako), *N*,*N*dimethylformamide (Wako), dichloromethane (Wako, super dehydrated), ethyl acetate (Wako), hexane (Wako), and NaCl (Wako, purity >99.5%) were used as received.

Characterization.

Molecular weight distribution (MWD) curves, number-average molecular weight (M_n) , and dispersity (D) of the polymers were measured by SEC in DMF containing 10 mM LiBr at 40 °C (flow rate: 1 mL/min) on three linear-type polystyrene gel columns (Shodex KF-805L: exclusion limit = $4 \times$ 10^6 ; particle size = 10 µm; pore size = 5000 Å; 0.8 cm i.d. × 30 cm) that were connected to a Jasco PU-2080 precision pump, a Jasco RI-2031 refractive index detector, and a Jasco UV-2075 UV/vis detector set at 270 nm. The columns were calibrated against 11 standard poly(MMA) samples (PSS, Polymer Standard Service GmbH, Ready Cal Kit: M_p = 2380 - 2200000 g/mol) or 9 standard poly(ethylene oxide) and poly(ethylene glycol) samples (PSS, Polymer Standard Service GmbH, Ready Cal Kit: $M_p = 238 - 504000$ g/mol). MWD curves, M_n , and D of the polymers were also measured by SEC in H₂O at 30 °C (flow rate: 1 mL/min) on a silica gel column (Shodex PROTEIN LW-803: exclusion limit = 1×10^6 (protein), particle size = 3 µm; 0.8 cm i.d. \times 30 cm) that was connected to the same pump and detectors as those used in DMF (UV-vis detector set at 345 nm). The column was calibrated against 9 standard poly(ethylene oxide) and poly(ethylene glycol) samples (PSS, Polymer Standard Service GmbH, Ready Cal Kit: M_p = 238 – 504000 g/mol). Before characterization, polymer samples were fractionated by preparative SEC in DMF at room temperature (flow rate: 15 mL/min) on TOSOH TSKgel α -3000 (exclusion limit = 9 × 10⁴ (PEO), particle size = 13 μ m; 5.5 cm i.d. \times 30 cm). ¹H and ¹³C nuclear magnetic resonance (NMR) measurement was performed in CDCl₃ or acetone-d₆ on a JEOL JNM-ECA500 spectrometer operating at 500 (¹H) and 125 (¹³C) MHz.

Absolute weight-average molecular weight (M_w) of the polymers in DMF or H₂O was determined by SEC equipped with multi-angle laser light scattering (MALLS) on a Dawn HELEOS II instrument (Wyatt Technology, semiconductor laser, $\lambda = 663$ nm). The SEC was performed in DMF containing 10 mM LiBr at 40 °C (flow rate: 1 mL/min) on three linear-type polystyrene gel columns (Shodex KF-805L) or in H₂O at 30 °C (flow rate: 1 mL/min) on a silica gel column (Shodex PROTEIN KW-804: exclusion limit = 4×10^6 (protein), particle size = 7 µm; 0.8 cm i.d. × 30 cm). The columns were connected to a Jasco PU-4180 precision pump, a Jasco RI-4030 refractive index detector, and a Jasco UV-4075 UV/vis detector set at 350 nm.

Dynamic light scattering (DLS) was measured on Otsuka Photal ELSZ-0 equipped with a semiconductor laser (wavelength: 658 nm). The measuring angle was 165° and the data was analyzed by CONTIN method.

Fluorescence spectra were recorded on JASCO FP-8500 spectrofluorometer equipped with a peltier thermostatted cell holder (ETC-815, JASCO). Parameters for the FRET studies were set as follows: excitation slit width = 2.5 nm, emission slit width = 2.5 nm, response = 0.1 sec, scanning speed = 1000 nm/min, excitation wavelength = 290.0 nm, emission wavelength = 300.0 - 550.0 nm. Parameters for the measurements of critical micellar concentration (CMC) were set as follows: excitation slit width = 2.5 nm, emission slit width = 1 nm, response = 0.1 sec, scanning speed = 500 nm/min, excitation wavelength = 334.0 nm, emission wavelength = 350.0 - 500.0 nm.

Monomer Synthesis.

2-Naphthylmethyl acrylate (NpA): In a 100 mL round-bottomed flask filled with argon, acryloyl chloride (9.5 mmol, 0.77 mL) was added to the solution of 2-naphthalenemethanol (6.3 mmol, 1.0 g) and triethylamine (13 mmol, 1.8 mL) in dry dichloromethane (15 mL) at 0 °C. The reaction mixture was stirred at 25 °C for 5 h and was poured into distilled water (50 mL). The aqueous phase was separated and extracted by dichloromethane (20 mL), and the extracts were combined with the organic layer. The combined organic phase was washed sequentially with a diluted HCl aqueous solution, a saturated solution of NaHCO₃, and brine. After the dichloromethane was removed in vacuo, the crude product was purified by silica gel column chromatography with dichloromethane/hexane = 1/1 (v/v) as an eluent to give NpA as a white solid (1.2 g, 29% yield). ¹H NMR [500 MHz, CDCl₃, 25 °C, $\delta = 0$ ppm (TMS)]: δ 7.89–7.81 (m, 4H, naphthalene ring), 7.52–7.47 (m, 3H, naphthalene ring), 6.47 (dd, *J* = 17.5, 1.4 Hz, 1H, CH₂=), 6.14 (dd, *J* = 17.3, 10.5 Hz, 1H, CH₂=CHCOO-), 5.67 (dd, *J* = 10.3, 1.4 Hz, 1H, CH₂=), 5.32-5.40 (s, 2H, -COOCH₂Np). ¹³C NMR [125 MHz, CDCl₃, 25 °C, $\delta = 77.16$ ppm (CHCl₃)]: δ 166.1, 133.4, 133.3, 133.2, 131.3, 128.5, 128.4, 128.1, 127.8, 127.5, 126.4, 126.3, 125.0, 66.6.

1-Pyrenylmethyl acrylate (PyA): In a 100 mL round-bottomed flask filled with argon, acryloyl chloride (13 mmol, 1.1 mL) was added to the solution of 1-pyrenemethanol (8.6 mmol, 2.0 g) and triethylamine (18 mmol, 2.5 mL) in dry dichloromethane (30 mL) at 0 °C. The reaction mixture was stirred at 25 °C for 5 h and was poured into distilled water (50 mL). The aqueous phase was separated and extracted by dichloromethane (20 mL), and the extracts were combined with the organic layer. The combined organic phase was washed sequentially with a diluted HCl aqueous solution, a saturated solution of NaHCO₃, and brine. After the dichloromethane was removed in vacuo, the crude product

was purified by silica gel column chromatography with hexane/ethyl acetate = 4/1 (v/v) as an eluent to give PyA as a yellow solid (1.0 g, 37% yield). ¹H NMR [500 MHz, CDCl₃, 25 °C, δ = 0 ppm (TMS)]: δ 8.30–7.97 (m, 9H, pyrene ring), 6.46 (dd, *J* = 17.3, 1.3 Hz, 1H, CH₂=), 6.18 (dd, *J* = 17.3, 10.5 Hz, 1H, CH₂=CHCOO-), 5.90 (s, 2H, -COOCH₂Py), 5.83 (dd, *J* = 10.5, 1.3 Hz, 1H, CH₂=). ¹³C NMR [125 MHz, CDCl₃, 25 °C, δ = 77.16 ppm (CHCl₃)]: δ 166.2, 131.8, 131.4, 131.2, 130.7, 129.6, 128.8, 128.4, 128.3, 127.9, 127.8, 127.4, 126.1, 125.6, 125.5, 124.9, 124.7, 122.9, 64.9.

Polymer Synthesis.

Polymer synthesis was carried out by syringe technique under argon in a round bottom flask equipped with a three-way stopcock.

PEGA/DA (50/50) random copolymer (Ran-D50): AIBN (0.075 mmol, 12 mg) was weighed in a 50 mL glass tube. Into the tube, DA (7.5 mmol, 2.0 mL), PEGA (7.5 mmol, 3.3 mL), toluene (9.5 mL), and tetralin (0.20 mL) were added sequentially at 25 °C under argon (the total volume: 15 mL). The tube was placed in an oil bath kept at 60 °C. After 21 h, the reaction was terminated by cooling the solution to -78 °C. The conversion of PEGA and DA was determined by ¹H NMR in CDCl₃ with tetralin as an internal standard: Conv. PEGA/DA = 86%/86%. The product was purified by preparative SEC in DMF as an eluent. The purified product was dried under vacuum at room temperature. SEC (DMF, PMMA std.): M_n = 33600 g/mol, D = 2.27. ¹H NMR [500 MHz, CDCl₃, 25 °C, δ = 0 ppm (TMS)]: 4.4–3.9 (-COOCH₂CH₂O-, -COOCH₂CH₂CH₂-), 3.8–3.7 (-COOCH₂CH₂O-), 3.7–3.5 (-OCH₂CH₂O-), 3.5–3.4 (-CH₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-CH₂CH₂O-), 2.0–1.5 (-CH₂CH₋, -COOCH₂CH₂(CH₂)₉CH₃), 1.5–1.2 (-COOCH₂CH₂(CH₂)₉CH₃), 1.0–0.8 (-COO(CH₂)₁₁CH₃).

Py-Labeled PEGA/DA (50/50) random copolymer (Ran-D50-Py): AIBN (0.050 mmol, 8.2 mg) and PyA (0.050 mmol, 14 mg) were weighed in a 50 mL glass tube. Into the tube, DA (49.5 mmol, 1.4 mL), PEGA (50 mmol, 2.2 mL), toluene (6.3 mL), and tetralin (0.20 mL) were added sequentially at 25 °C under argon (the total volume: 10 mL). The tube was placed in an oil bath kept at 60 °C. After 15 h, the reaction was terminated by cooling the solution to -78 °C. The conversion of PEGA and DA was determined by ¹H NMR in CDCl₃ with tetralin as an internal standard: Conv. PEGA/DA = 87%/87%. The product was purified by preparative SEC in DMF as an eluent. The purified product was dried under vacuum at room temperature. SEC (DMF, PMMA std.): $M_n = 33000$ g/mol, D = 2.21. ¹H NMR [500 MHz, CDCl₃, 25 °C, δ = 0 ppm (TMS)]: 8.4–8.0 (pyrene ring in PyA), 5.9–5.8 (-COOCH₂Py), 4.4–3.9 (-COOCH₂CH₂O-, -COOCH₂CH₂CH₂-), 3.8–3.7 (-COOCH₂CH₂O-), 3.7–3.5 (-OCH₂CH₂O-), 3.5–3.4 (-CH₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-CH₂CH₂CO-), 2.0–1.5 (-CH₂CH-, -COOCH₂CH₂(CH₂)₉CH₃), 1.5–1.2 (-COOCH₂CH₂(CH₂)₉CH₃), 1.0–0.8 (-COO(CH₂)₁₁CH₃).

Np-Labeled PEGA/DA (50/50) random copolymer (Ran-D50-Np): AIBN (0.050 mmol, 8.2 mg) and NpA (0.050 mmol, 10 mg) were weighed in a 50 mL glass tube. Into the tube, DA (49.5 mmol, 1.4 mL), PEGA (50 mmol, 2.2 mL), toluene (6.3 mL), and tetralin (0.20 mL) were added sequentially at 25 °C under argon (the total volume: 10 mL). The tube was placed in an oil bath kept at 60 °C. After 15 h, the reaction was terminated by cooling the solution to –78 °C. The conversion of PEGA and DA

was determined by ¹H NMR in CDCl₃ with tetralin as an internal standard: Conv. PEGA/DA = 84%/84%. The product was purified by preparative SEC in DMF as an eluent. The purified product was then dried under vacuum at room temperature. SEC (DMF, PMMA std.): M_n = 34000 g/mol, D = 2.43. ¹H NMR [500 MHz, CDCl₃, 25 °C, δ = 0 ppm (TMS)]: 8.1–7.9 and 7.7–7.5 (naphthalene ring in NpA), 5.3-5.2 (-COOCH₂Np), 4.4–3.9 (-COOCH₂CH₂O-, -COOCH₂CH₂CH₂-), 3.8–3.7 (-COOCH₂CH₂O-), 3.7–3.5 (-OCH₂CH₂O-), 3.5–3.4 (-CH₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-CH₂CH₂O-), 2.0–1.5 (-CH₂CH-, -COOCH₂CH₂(CH₂)₉CH₃), 1.5–1.2 (-COOCH₂CH₂(CH₂)₉CH₃), 1.0–0.8 (-COO(CH₂)₁₁CH₃).

Py-Labeled PEGA/DA (60/40) random copolymer (Ran-D40-Py): AIBN (0.10 mmol, 16 mg) and PyA (0.050 mmol, 14 mg) were weighed in a 50 mL glass tube. Into the tube, DA (39.5 mmol, 1.1 mL), PEGA (60 mmol, 2.6 mL), toluene (6.1 mL), and tetralin (0.20 mL) were added sequentially at 25 °C under argon (the total volume: 10 mL). The tube was placed in an oil bath kept at 60 °C. After 22 h, the reaction was terminated by cooling the solution to -78 °C. The conversion of PEGA and DA was determined by ¹H NMR in CDCl₃ with tetralin as an internal standard: Conv. PEGA/DA = 86%/86%. The product was purified by preparative SEC in DMF as an eluent. The purified product was then dried under vacuum at room temperature. SEC (DMF, PMMA std.): $M_n = 29600$ g/mol, D = 2.05. ¹H NMR [500 MHz, CDCl₃, 25 °C, $\delta = 0$ ppm (TMS)]: 8.4–8.0 (pyrene ring in PyA), 5.9–5.8 (-COOC<u>H</u>₂Py), 4.4–3.9 (-COOC<u>H</u>₂CH₂O-, -COOC<u>H</u>₂CH₂CH₂-), 3.8–3.7 (-COOC<u>H</u>₂CH₂O-), 3.7–3.5 (-OC<u>H</u>₂C<u>H</u>₂O-), 3.5–3.4 (-C<u>H</u>₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-CH₂C<u>H</u>₂O-), 2.0–1.5 (-C<u>H</u>₂CH₂-, -COOCH₂CH₂(CH₂)₉CH₃), 1.0–0.8 (-COO(CH₂)₁₁C<u>H</u>₃).

Np-Labeled PEGA/DA (60/40) random copolymer (Ran-D40-Np): AIBN (0.10 mmol, 16 mg) and NpA (0.050 mmol, 10 mg) were weighed in a 50 mL glass tube. Into the tube, DA (39.5 mmol, 1.1 mL), PEGA (60 mmol, 2.6 mL), toluene (6.1 mL), and tetralin (0.20 mL) were added sequentially at 25 °C under argon (the total volume: 10 mL). The tube was placed in an oil bath kept at 60 °C. After 22 h, the reaction was terminated by cooling the solution to -78 °C. The conversion of PEGA and DA was determined by ¹H NMR in CDCl₃ with tetralin as an internal standard: Conv. PEGA/DA = 85%/85%. The product was purified by preparative SEC in DMF as an eluent. The purified product was then dried under vacuum at room temperature. SEC (DMF, PMMA std.): $M_n = 23400$ g/mol, D = 2.08. ¹H NMR [500 MHz, CDCl₃, 25 °C, $\delta = 0$ ppm (TMS)]: 8.1–7.9 and 7.7–7.5 (naphthalene ring in NpA), 5.3-5.2 (-COOCH₂CH₂O-), 3.5–3.4 (-CH₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-COOCH₂CH₂O-), 3.7–3.5 (-OCH₂CH₂O-), 3.5–3.4 (-CH₂OCH₃), 3.4–3.3 (-OCH₃), 2.6–2.3 (-CH₂CH₂O-), 2.0–1.5 (-CH₂CH-, -COOCH₂CH₂(CH₂)₉CH₃), 1.5–1.2 (-COOCH₂CH₂(CH₂)₉CH₃), 1.0–0.8 (-COO(CH₂)₁₁CH₃).

PEGA/DVE alternating copolymer (Alt-D50): AIBN (0.38 mmol, 62 mg) was weighed in a 300 mL round bottom flask. Into the flask, DVE (260 mmol, 66 mL), PEGA (7.5 mmol, 3.3 mL), toluene (78 mL), and tetralin (3.0 mL) were added sequentially at 25 °C under argon (the total volume: 150 mL). The flask was placed in an oil bath kept at 60 °C. After 4 h, the reaction was terminated by cooling the solution to -78 °C. The conversion of PEGA and DVE was determined to be >99% and 3.0%,

respectively, by ¹H NMR in CDCl₃ with tetralin as an internal standard. The product was purified by dialysis in acetone and by preparative SEC in DMF as an eluent. The purified product was then dried under vacuum at room temperature. SEC (DMF, PMMA std.): $M_n = 33500$ g/mol, D = 1.72. ¹H NMR [500 MHz, CDCl₃, 25 °C, $\delta = 0$ ppm (TMS)]: 4.3–4.1 (-COOCH₂CH₂O-), 3.8–3.5 (-COOCH₂CH₂O-, -OCH₂CH₂O-), 3.4–3.2 (-OCH₃, -OCH₂CH₂CH₂-), 3.2–3.0 (-CH₂CH₀-), 2.8–2.3 (-CH₂CH₂CO-), 2.0–1.1 (-CH₂CHO-, -CH₂CHCO-, -OCH₂(CH₂)₁₀CH₃), 0.9–0.8 (-CHO(CH₂)₁₁CH₃).

Preparation of Polymer Micelles in Water.

The dichloromethane solution of a random or alternating copolymer was evaporated, and the resulting bulk polymer was dissolved in water. The aqueous solution was sonicated for 3 minutes at 25 °C and kept for 1 h at 25 °C. The solution was then filtrated with a PTFE membrane filter (pore size = 0.45μ m) before SEC, DLS, and fluorescence measurements.

Critical Micelle Concentration (CMC) of Random or Alternating Copolymers in Water.

CMC of the random or alternating copolymers was determined by fluorescence spectroscopy of pyrene in the presence of the copolymers in water. Aqueous solutions of the copolymers with 14 different concentrations between 1.0×10^{-4} mg/mL and 1.0×10^{-1} mg/mL (each volume: 2 mL) were prepared in vials. Into the solutions, a DMSO solution of pyrene (1×10^{-4} M, 10μ L) was added. The resulting mixtures were sonicated for 2 min and allowed to equilibrate for 20 h at room temperature before fluorescence measurement. The final concentration of pyrene was 5×10^{-7} M, which is lower than the saturation concentration of pyrene in water at 25 °C. All steady-state fluorescence spectra were recorded on a fluorescence spectrometer, JASCO FP-8500, under the following conditions: excitation slit width = 2.5 nm, emission slit width = 1 nm, response = 0.1 sec, scanning speed = 500 nm/min, excitation wavelength = 334.0 nm, emission wavelength = 350.0 – 500.0 nm, temperature = 25 °C. I_1/I_3 , the intensity ratio of the first (I_1 , 373 nm) and the third (I_3 , 384 nm) vibronic bands of pyrene emission, was plotted as a function of polymer concentration. CMC was determined as the concentration at which I_1/I_3 started to decrease.

Dynamic Polymer Exchange between Micelles.

Into a cuvette containing the 1 mL aqueous solution of a Py-labeled micelle at measuring temperature, a 1 mL aqueous solution of a Np-labeled micelle at the same temperature was added quickly with stirring. The fluorescence spectra of the resulting solution were immediately recorded at the predetermined temperature for 2 h. The collected fluorescence spectra were fitted by eq.1 (in the main text) to calculate k_{obs} . The k_{obs} values were applied to Arrhenius Plot to calculate activation energy (E_a) for the exchange process of polymer chains between their micelles.

Supporting Data

Scheme S1. Synthesis of (a) a PEGA/DA (50/50) random copolymer, (b) Np or Py-labeled PEGA/DA random copolymers, and (c) a PEGA/DVE alternating copolymer.

Figure S1. Synthesis of PEGA/DA/PyA or NpA random copolymers (a: Ran-D50, b: Ran-D50-Py, c: Ran-D50-Np, d: Ran-D40-Py, e: Ran-D40-Np) or a PEGA/DVE alternating copolymer (f: Alt-D50) via free radical copolymerization of PEGA, DA, and PyA or NpA. Upper: time conversion plots, lower: SEC curves of the final products. [PEGA]₀/[DA]₀/[AIBN]₀ = 500/500/5.0 mM (Ran-D50), [PEGA]₀/[DA]₀/[PyA (NpA)]₀/[AIBN]₀ = 500/495/5.0/5.0 mM (Ran-D50-Py or Np), [PEGA]₀/[DA]₀/[PyA (NpA)]₀/[AIBN]₀ = 600/395/5.0/10 mM (Ran-D40-Py or Np), and [PEGA]₀/[DVE]₀/[AIBN]₀ = 50/1700/2.5 mM (Alt-D50) in toluene at 60 °C. The final products in (a–f) were purified by preparative SEC. The in-set M_n and D values are determined with PMMA standard calibration.

Figure S2. SEC curves, M_n , and D of (a) Ran-D50-Py and (b) Ran-D50-Np in DMF (10 mM LiBr) with PEO standard calibration. These polymers were fractionated into six samples with different molecular weights (A–F) by preparative SEC. SEC curves, M_n , and D of fractionated (c) Ran-D50-Py-A – F and (d) Ran-D50-Np-A – F in DMF (10 mM LiBr) with PEO standard calibration.

Table S1. Characterization of PEGA/DA Random Copolymers^a

^{*a*} A PEGA/DVE copolymer (**Ran-D50**) was synthesized by free radical copolymerization of PEGA and DA with AIBN: $[PEGA]_0/[DA]_0/[AIBN]_0 = 500/500/5.0 \text{ mM}$ in toluene at 60 °C. **Ran-D50-A** – **F** were obtained from the fractionation of **Ran-D50** by preparative SEC.

^b DA content in the copolymers determined by ¹H NMR.

^{*c*} Degree of polymerization (DP) and the copolymer composition (m/n: DP of PEGA and DVE determined by ¹H NMR, $M_{w,DMF}$ (MALLS), and $D_{,DMF}$ (MALLS). n.d.: not determined.

^{*d*} Number-average molecular weight (M_n) determined by SEC in DMF (10 mM LiBr) or H₂O (100 mM NaCl) with PEO standard calibration.

^{*e*} Absolute weight-average molecular weight (M_w) and dispersity (D) determined by SEC-MALLS in DMF (10 mM LiBr) or H₂O (100 mM NaCl). n.d.: not determined. Refractive Index Increment (dn/dc) of the polymers was determined by the on-line RI detector of SEC-MALLS in DMF (10 mM LiBr) or H₂O (100 mM NaCl).

^{*f*}Aggregation number of their micelles in H₂O: $N_{agg} = M_{w,H2O}$ (MALLS)/ $M_{w,DMF}$ (MALLS). n.d.: not determined.

Table S4. Characterization of PEGA/DVE Alternating Copolymers^a

^{*a*} A PEGA/DVE copolymer (Alt-D50) was synthesized by free radical copolymerization of PEGA and DVE with AIBN: $[PEGA]_0/[DVE]_0/[AIBN]_0 = 50/1700/2.5$ mM in toluene at 60 °C. Alt-D50-A – F were obtained from the fractionation of Alt-D50 by preparative SEC.

^b DVE content in the copolymers determined by ¹H NMR.

^{*c*} DP and the copolymer composition (m/n: DP of PEGA and DVE determined by ¹H NMR, $M_{w,DMF}$ (MALLS), and $D_{,DMF}$ (MALLS). n.d.: not determined.

^d M_n determined by SEC in DMF (10 mM LiBr) or H₂O (100 mM NaCl) with PEO standard calibration.

^{*e*} Absolute weight-average molecular weight (M_w) and dispersity (D) determined by SEC-MALLS in DMF (10 mM LiBr) or H₂O (100 mM NaCl). n.d.: not determined. Refractive Index Increment (dn/dc) of the polymers was determined by the on-line RI detector of SEC-MALLS in DMF (10 mM LiBr) or H₂O (100 mM NaCl).

^{*f*}Aggregation number of their micelles in H₂O: $N_{agg} = M_{w,H2O}$ (MALLS)/ $M_{w,DMF}$ (MALLS). n.d.: not determined.

Figure S4. ¹³C NMR spectra of the carbonyl or methine carbons in the PEGA units of (a) a PEGA homopolymer ($M_n = 12,000 \text{ g/mol}$, D = 1.21 by SEC with PMMA std.), (b) a PEGA/DVE (3/1) statistical copolymer ($M_n = 33,000 \text{ g/mol}$, D = 1.82 by SEC with PMMA std.), and (c) Alt-D50 in toluene- d_8 at 55 °C: [polymer] = 200 mg/mL. ¹³C NMR spectra of the methine carbons in the DVE units of (d) a DVE homopolymer ($M_n = 16,000 \text{ g/mol}$, D = 1.03 by SEC with PMMA std.), (e) a PEGA/DVE (3/1) statistical copolymer, and (f) Alt-D50 in toluene- d_8 at 55 °C: [polymer] = 200 mg/mL.

Figure S5. (a–g) ¹H NMR spectra of Ran-D50 and Ran-D50-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S6. (a–g) ¹H NMR spectra of Ran-D50-Py and Ran-D50-Py-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S7. (a–g) ¹H NMR spectra of Ran-D50-Np and Ran-D50-Np-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S8. (a–g) ¹H NMR spectra of Ran-D40-Py and Ran-D40-Py-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S9. (a–g) ¹H NMR spectra of Ran-D40-Np and Ran-D40-Np-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S10. (a–g) ¹H NMR spectra of Alt-D50 and Alt-D50-A – F in CDCl₃ at 25 °C: [polymer] = 30 mg/mL.

Figure S11. SEC curves, M_n , and D of (a) **Ran-D50-Py**, (b) **Ran-D50-Np**, (c) **Ran-D50-Py-A** – **F**, and (d) **Ran-D50-Np-A** – **F** in H₂O (10 mM LiBr) with PEO standard calibration.

Figure S12. SEC curves, M_n , and D of (a) Ran-D40-Py, (b) Ran-D40-Np, (c) Alt-D50, (d) Ran-D40-Py-A – F, (e) Ran-D40-Np-A – F, and (f) Alt-D50-A – F in H₂O (10 mM LiBr) with PEO standard calibration.

Figure S13. DLS intensity distribution of (a) Ran-D50, (b) Ran-D50-Py, (c) Ran-D50-Np, (d) Ran-D50-A – F, (e) Ran-D50-Py-A – F, and (f) Ran-D50-Np-A – F micelles in H₂O at 25 °C: [polymer] = 1.0 mg/mL. Several samples contain aggregates with about or above 100 nm diameter, whereas the volume fraction of the aggregates was below 2%.

Figure S14. DLS intensity distribution of (a) Ran-D40-Py, (b) Ran-D40-Np, (c) Alt-D50, (d) Ran-D40-Py-A – F, (e) Ran-D40-Np-A – F, and (f) Alt-D50-A – F micelles in H₂O at 25 °C: [polymer] = 1.0 mg/mL. Several samples contain aggregates with about or above 100 nm diameter, whereas the volume fraction of the aggregates was below 2%.

Figure S15. (a–h) Emission spectra of the aqueous solutions of pyrene (5×10^{-7} M: normalized at I_1) with (a) **Ran-D50**, (b) **Ran-D50-A**, (c) **Ran-D50-F**, (d) **Alt-D50**, (e) **Alt-D50-A**, and (f) **Alt-D50-F** at 25 °C [polymer] = $1.0 \times 10^{-4} - 1.0 \times 10^{-1}$ mg/mL in H₂O. (g, h) Emission spectra of the aqueous solutions of pyrene (5×10^{-7} M: normalized at I_1) in the presence or absence of (g) **Ran-D50** and (h) **Alt-D50** at 25 °C: [polymer] = 1.0×10^{-4} (black) or 0 (light blue) mg/mL.

Figure S16. (a–e) Fluorescence spectra of the aqueous mixtures of a **Ran-D50-Py-D** micelle and a **Ran-D50-Np-D** micelle by the excitation at 290 nm at (a) 5 °C, (b) 10 °C, (c) 13 °C, (d) 18 °C, and (e) 25 °C: [polymer] = 1.0 mg/mL. The fluorescence intensity was monitored at 396 nm (I_{Py}) and 336 nm (I_{Np}) after mixing the two micelles.

Figure S17. (a–d) Fluorescence spectra of the aqueous mixtures of a **Ran-D40-Py-D** micelle and a **Ran-D40-Np-D** micelle by the excitation at 290 nm at (a) 10 °C, (b) 15 °C, (c) 25 °C, and (d) 35 °C: [polymer] = 1.0 mg/mL. The fluorescence intensity was monitored at 396 nm (I_{Py}) and 336 nm (I_{Np}) after mixing the two micelles.

Figure S18. (a–d) Fluorescence spectra of the aqueous mixtures of a **Ran-D50-Py-F** micelle and a **Ran-D50-Np-F** micelle by the excitation at 290 nm at (a) 10 °C, (b) 15 °C, (c) 25 °C, and (d) 35 °C: [polymer] = 1.0 mg/mL. The fluorescence intensity was monitored at 396 nm (I_{Py}) and 336 nm (I_{Np}) after mixing the two micelles.

Figure S19. Normalized I_{Py} ($I_{Py,norm}$) and fitting curves for the chain exchange of the binary mixtures of a **Ran-D40-Py-D** micelle ($N_{agg} = 2$) and a **Ran-D40-Np-D** micelle ($N_{agg} = 2$) in water at 10 – 35 °C: [polymer] = 1.0 mg/mL.

Dalaman Minterna	$k_{ m obs} ({ m min}^{-1})^{\ a}$									
Polymer Mixtures	10 °C	13 °C	15 °C	18 °C	25 °C	35 °C				
Ran-D50-Py-D $(N_{agg} = 2)$ + Ran-D50-Np-D $(N_{agg} = 2)$	8.0 × 10 ⁻³	9.2 × 10 ⁻³	n.d.	1.2 × 10 ⁻²	1.6 × 10 ⁻²	3.0 × 10 ⁻²
