1. Supplementary Figures 1-19

Fig. S1. XRD spectra of bulk MoS₂, WS₂, and TiS₂.

Fig. S2. Photographs of exfoliated MoS₂, WS₂, and TiS₂ nanosheets dispersed in DI water.

Fig. S3. Zetapotential of exfoliated MoS₂, WS₂, and TiS₂ nanosheets solution.

Fig. S4. Raman spectra of pristine TMDs and Pd-TMDs.

Fig. S5. TEM images of MoS₂, WS₂, and TiS₂ nanosheets.

Fig. S6. TEM images of Pd-MoS₂, Pd-WS₂, and Pd-TiS₂ composites.

Fig. S7. EDS spectra of Pd-MoS₂, Pd-WS₂, and Pd-TiS₂ composites.

Fig. S8. XPS full spectra of pristine TMDs and Pd-TMD composites.

Fig. S9. Zetapotential of Pd-TMD solution.

Fig. S10. XPS spectra of Pd-TMDs after durability test.

Fig. S11. Raman spectra of Pd-TMDs after durability test.

Fig. S12. SEM and HRTEM images of Pd-TMDs after durability test.

Fig. S3. Model diagrams and possible H adsorption sites for TMDs, Pd(111) and Pd(211).

Fig. S14. The adsorption models and corresponding adsorption energy for H adsorbed on different sites of TMDs.

Fig. S15. The adsorption models and corresponding adsorption energy for H adsorbed on different sites of Pd(111) and Pd(211).

Fig. S16. Models of 1 H* adsorbed on Pd (111) and Pd(211).

Fig. S17. COHP for the ninth H* bonded to Pd (111).

Fig. S18. COHP for the ninth H* bonded to Pd (211).

Fig. S19. COHP for the H* and S in TMDs.

2. Supplementary table 1

Table S1. Compare HER performance of Pd-MoS₂, Pd-WS₂, and Pd-TiS₂ composites with Pd-decorated 2D catalysts reported in literature.

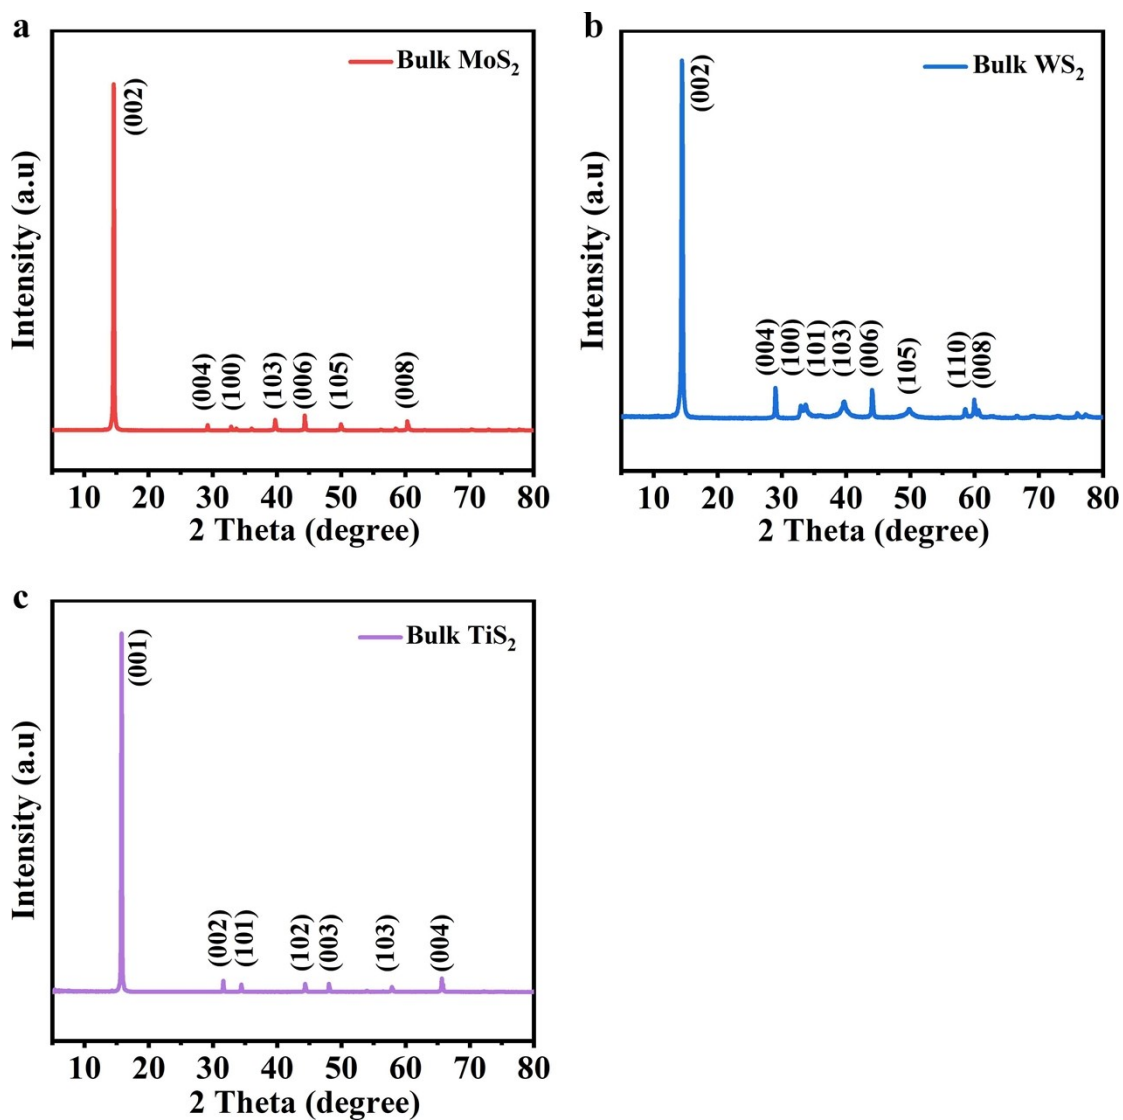

Fig. S1 | XRD spectra of bulk MoS₂ (a), bulk WS₂ (b) and bulk TiS₂ (c). The high purity phase of bulk MoS₂, WS₂, TiS₂ are confirmed; the peaks detected in bulk MoS₂, bulk WS₂, and bulk TiS₂ can be well indexed to MoS₂-PDF#06-0097, WS₂-PDF#08-0237, and TiS₂-PDF#15-0853. The strongest peak that corresponding to (002) plane of MoS₂ and WS₂, as well as (001) plane of TiS₂ indicate their layered structures.

Fig. S2 | Photographs of exfoliated MoS₂ nanosheets (**a**), WS₂ nanosheets (**b**) and TiS₂ nanosheets (**c**) dispersed in DI water. All these TMD nanosheets are well dispersed in DI water.

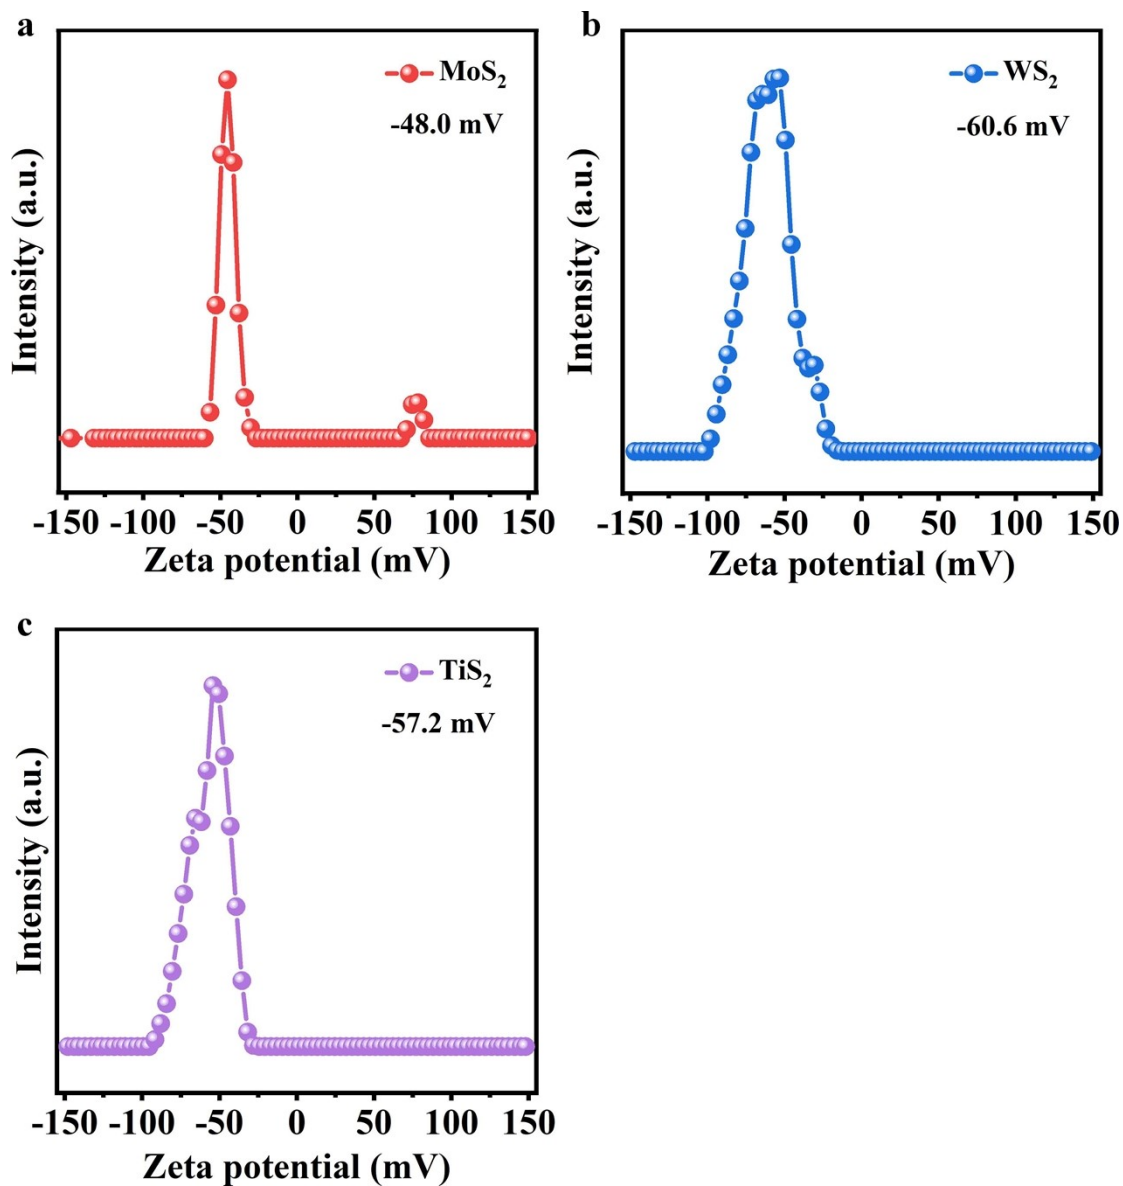

Fig. S3 | Zeta potential of exfoliated MoS₂ nanosheets solution (a), exfoliated WS₂ nanosheets solution (b) and exfoliated TiS₂ nanosheets solution (c). All the MoS₂, WS₂, and TiS₂ nanosheets solution exhibit a negative charge in DI water, which enables their well dispersibility in DI water via electrostatic repulsion.

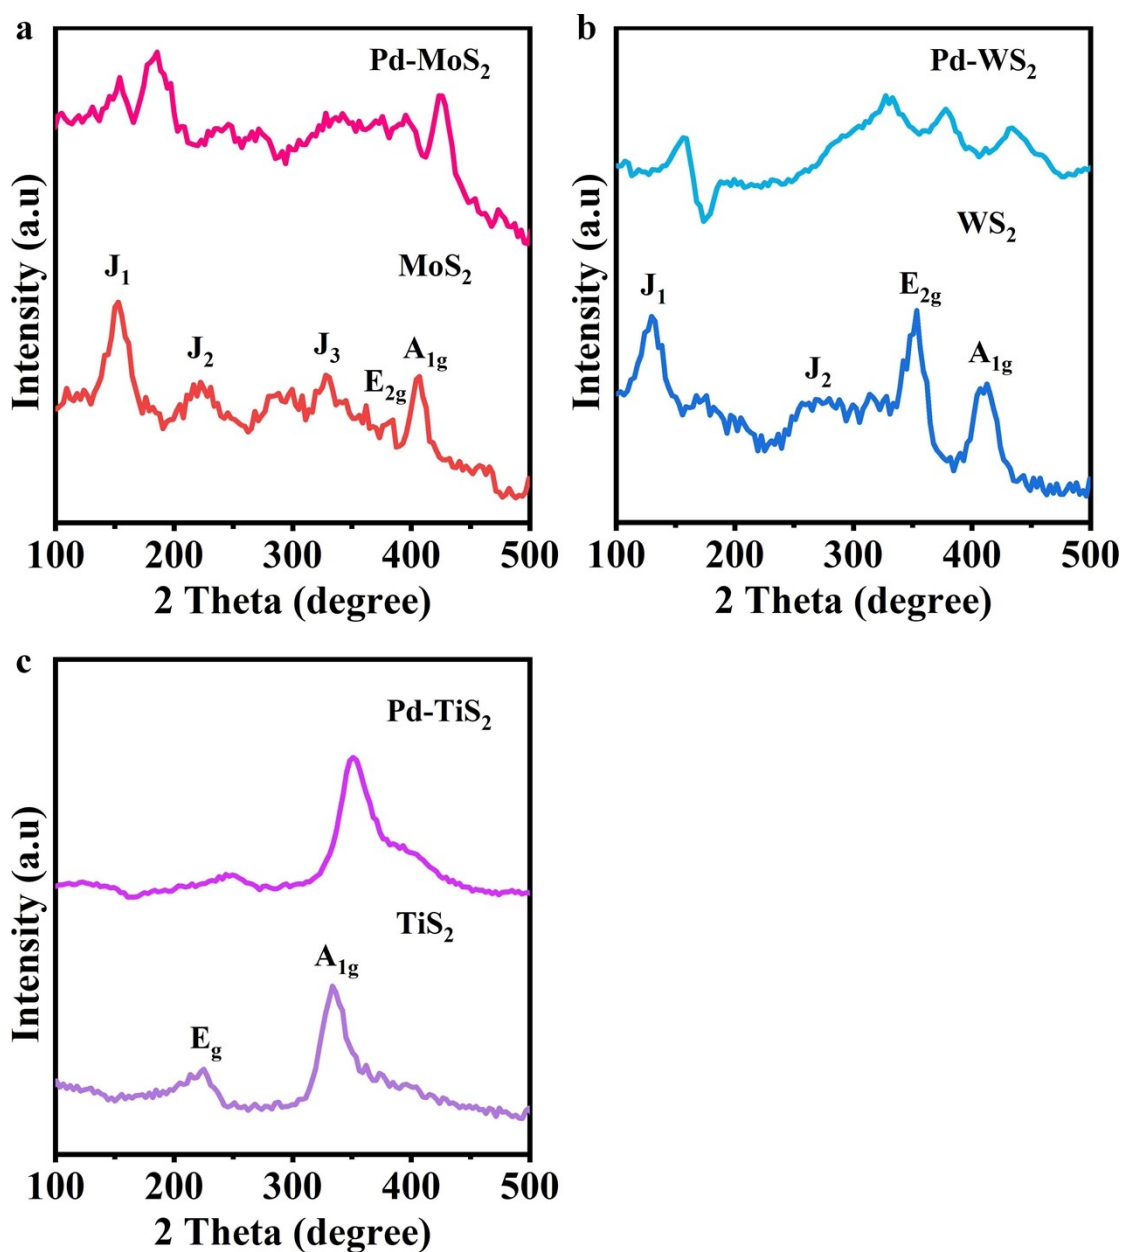

Fig. S4 | Raman spectra of MoS₂ and Pd-MoS₂ (a), WS₂ and Pd-WS₂ (b), TiS₂ and Pd-TiS₂ (c) nanosheets.

Peaks at 152 cm⁻¹, 223 cm⁻¹, 329 cm⁻¹ are corresponding to J₁, J₂, J₃ of metallic (1T or 1T') MoS₂, while the peaks at 381 cm⁻¹ and 406 cm⁻¹ are attributed to the E_{2g} and A_{1g} of semiconducting MoS₂ (Fig. S4a). Peaks at 131 cm⁻¹, 271 cm⁻¹, 385 cm⁻¹ are corresponding to J₁, J₂, J₃ of metallic (1T or 1T') WS₂, while the peaks at 353 cm⁻¹ and 410 cm⁻¹ are attributed to the E_{2g} and A_{1g} of semiconducting WS₂ (Fig. S4b). Peaks at 224 cm⁻¹ and 334 cm⁻¹ are corresponding to E_g and A_{1g} of 1T TiS₂ (Fig. S4c).

Fig. S5 | TEM images of exfoliated MoS₂ nanosheets (a), exfoliated WS₂ nanosheets (b) and exfoliated TiS₂ nanosheets (c). The insets show the diffraction patterns. All the MoS₂, WS₂, and TiS₂ nanosheets exhibit nanosheets morphology and good crystallinity.

Fig. S6 | TEM images of Pd-MoS₂ (a), Pd-WS₂ (b) and Pd-TiS₂ (c) composites. The monodispersed Pd nanoparticles are densely decorated onto each TMD nanosheets.

Fig. S7 | EDS spectra of Pd-MoS₂ (a), Pd-WS₂ (b) and Pd-TiS₂ (c) composites. The atomic ration for each element in Pd-TMD composites are shown in (d).

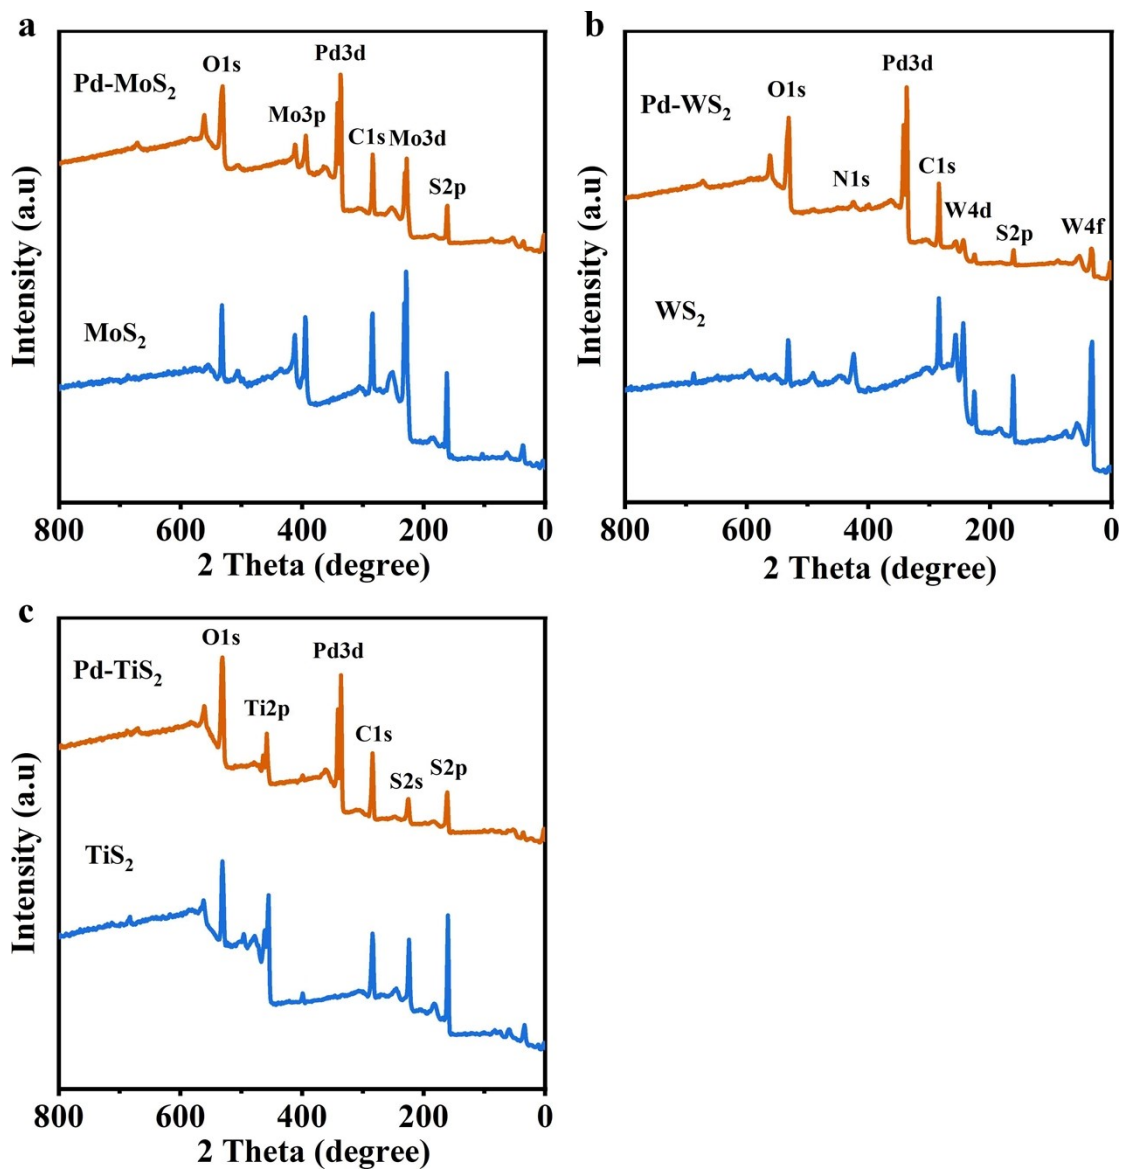

Fig. S8 | XPS full spectra of Pd-MoS₂ and pristine MoS₂ (a), Pd-WS₂ and pristine WS₂ (b), Pd-TiS₂ and pristine TiS₂ (c). All the Pd-TMD composites exhibit strong Pd3d signal compared with pristine TMD.

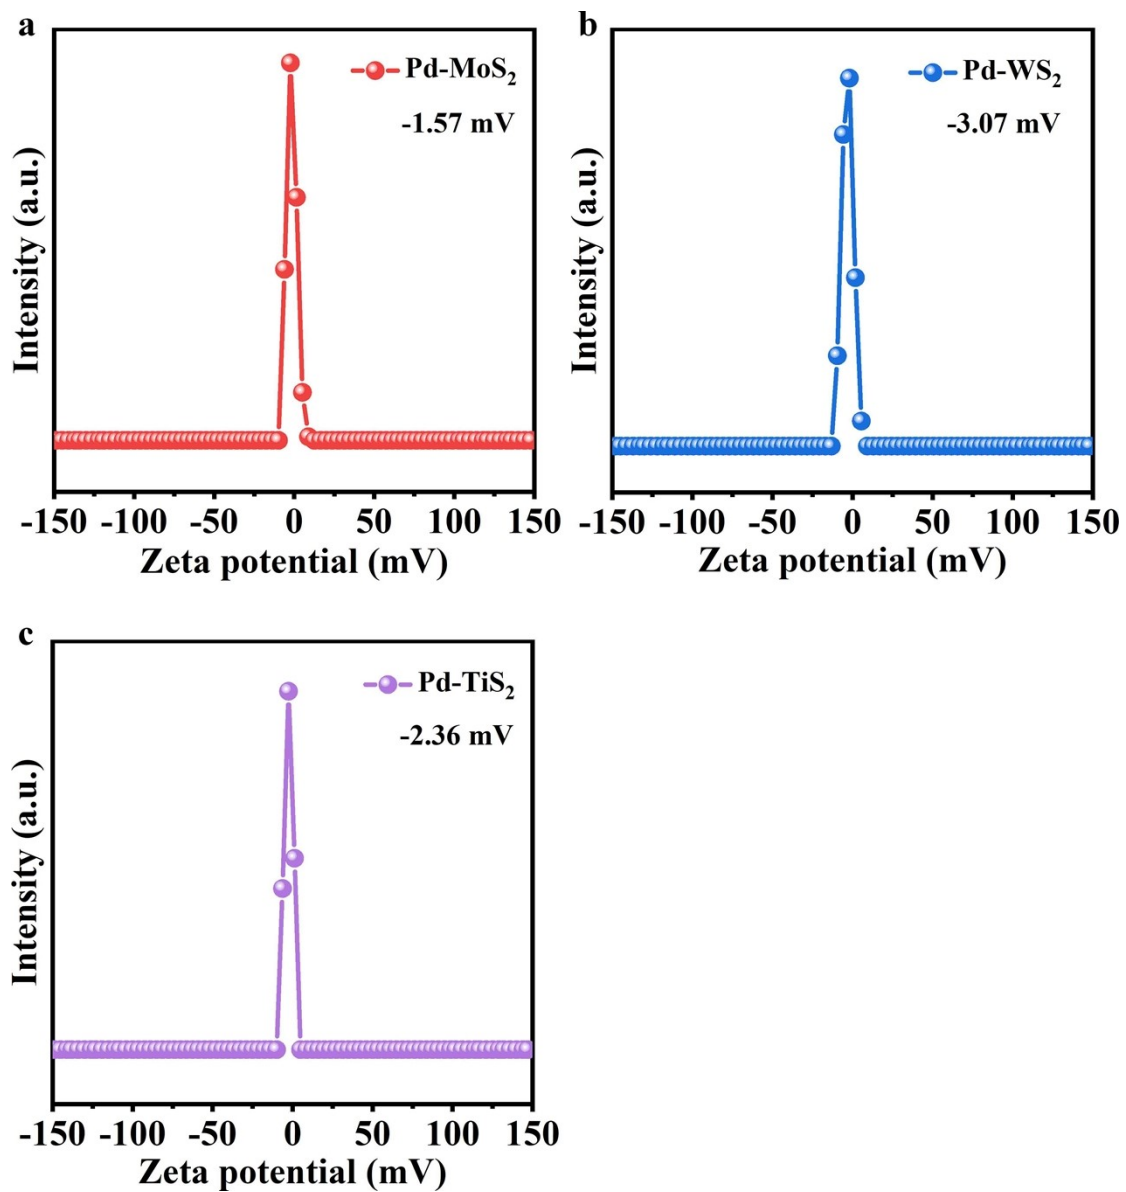

Fig. S9 | Zeta potential of Pd-MoS₂ (a), Pd-WS₂ (b) and Pd-TiS₂ solution (c).

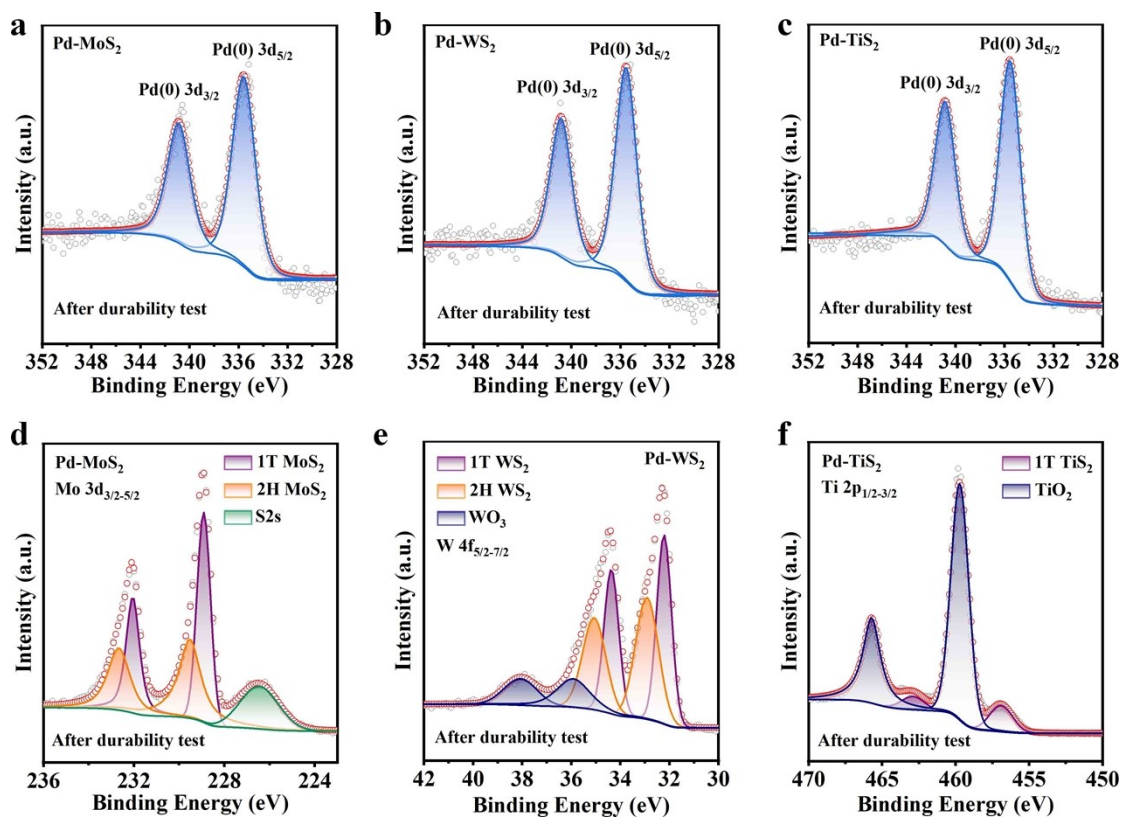

Fig. S10 | The XPS data for Pd 3d (a-c), Mo 3d (d), W 4f (e), and Ti 2p (f) of Pd-MoS₂, Pd-WS₂, and Pd-TiS₂ after durability test.

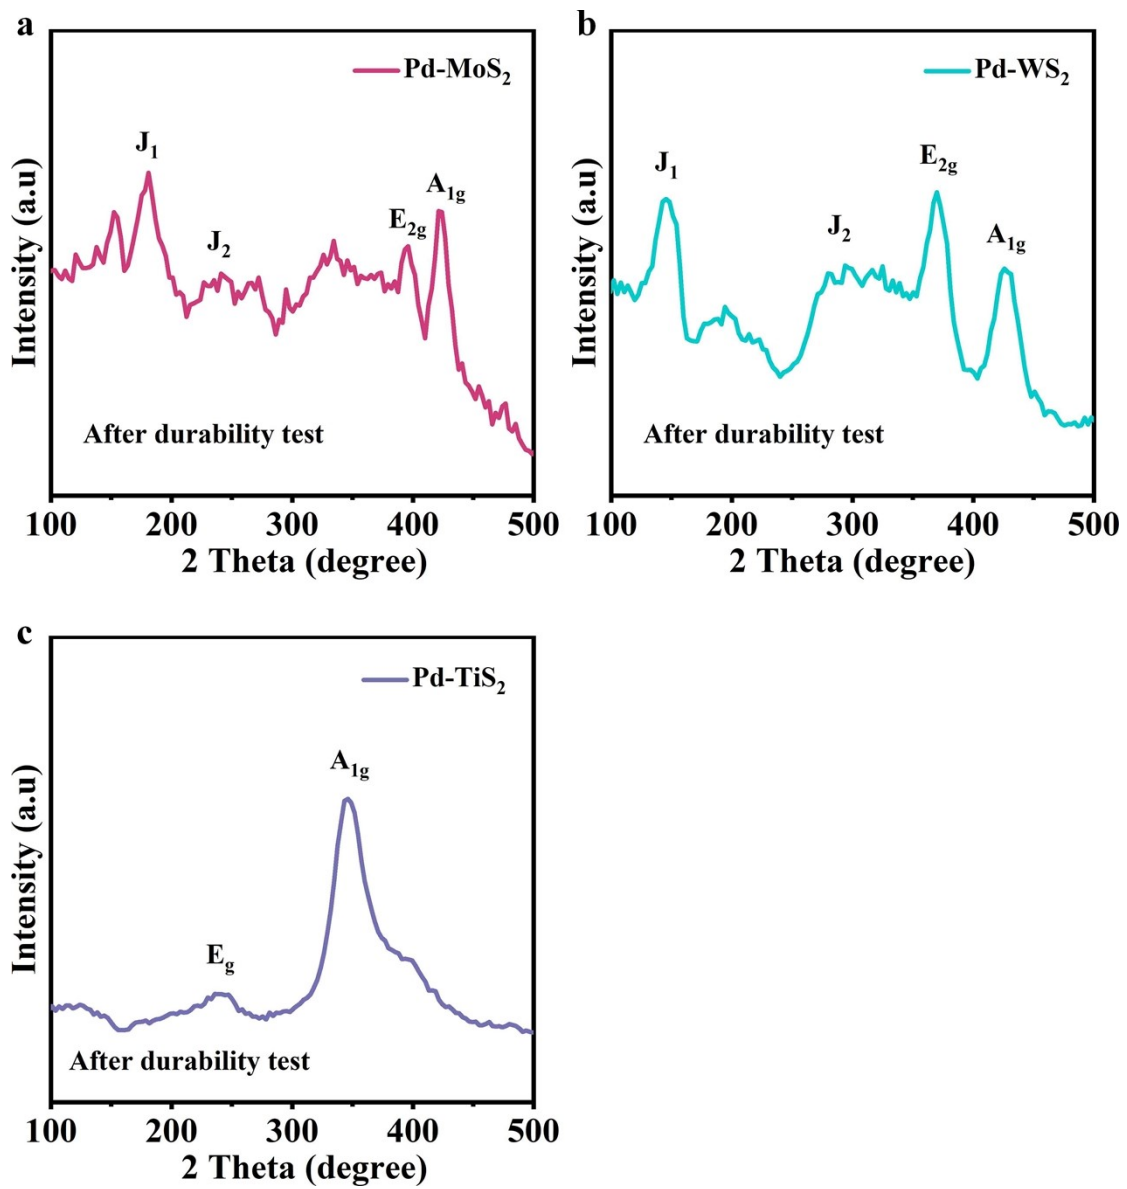

Fig. S11 | The Raman spectra of Pd-MoS₂, Pd-WS₂, and Pd-TiS₂ after durability test.

Fig. S12 | SEM images of Pd-MoS₂ (**a**), Pd-WS₂ (**b**), and Pd-TiS₂ (**c**) after durability test. The corresponding HRTEM images are shown in (**d-f**).

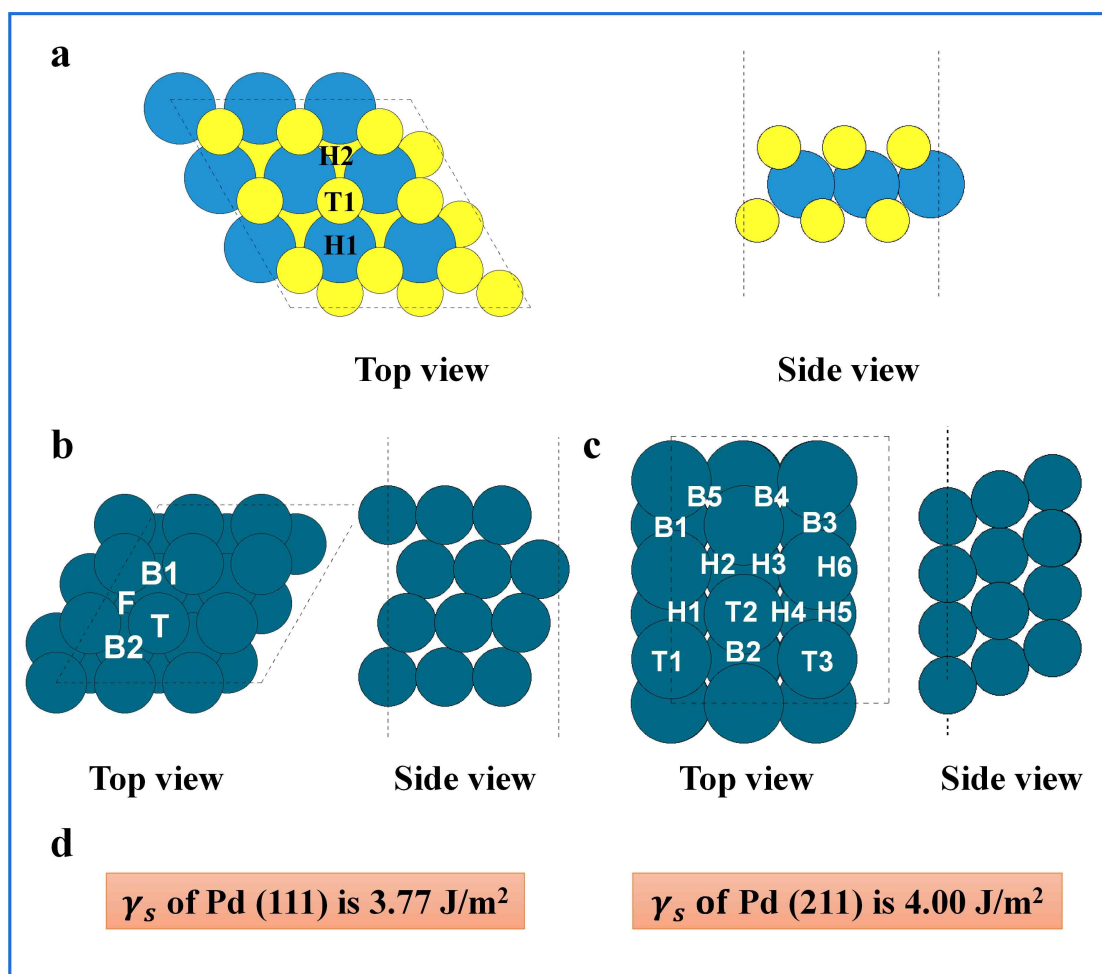

Fig. S13 | Model diagrams and possible H adsorption sites for TMD (a), Pd (111) (b), and Pd (211) (c). Surface energy value of Pd (111) and Pd (211) (d).

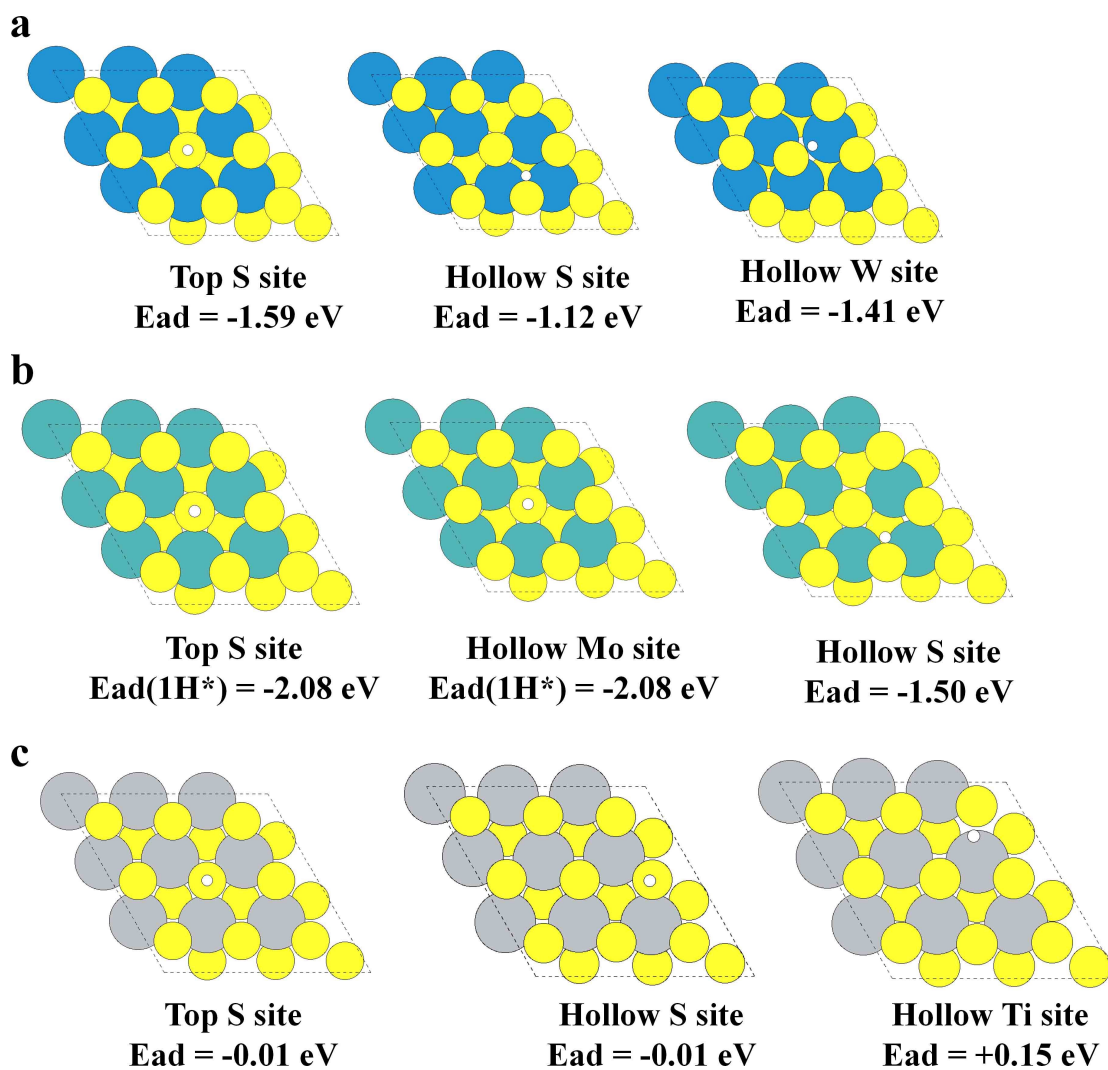

Fig. S14 | The most stable adsorption models and corresponding adsorption energy values for H adsorbed on different sites of TiS_2 (a), WS_2 (b), and MoS_2 (c).

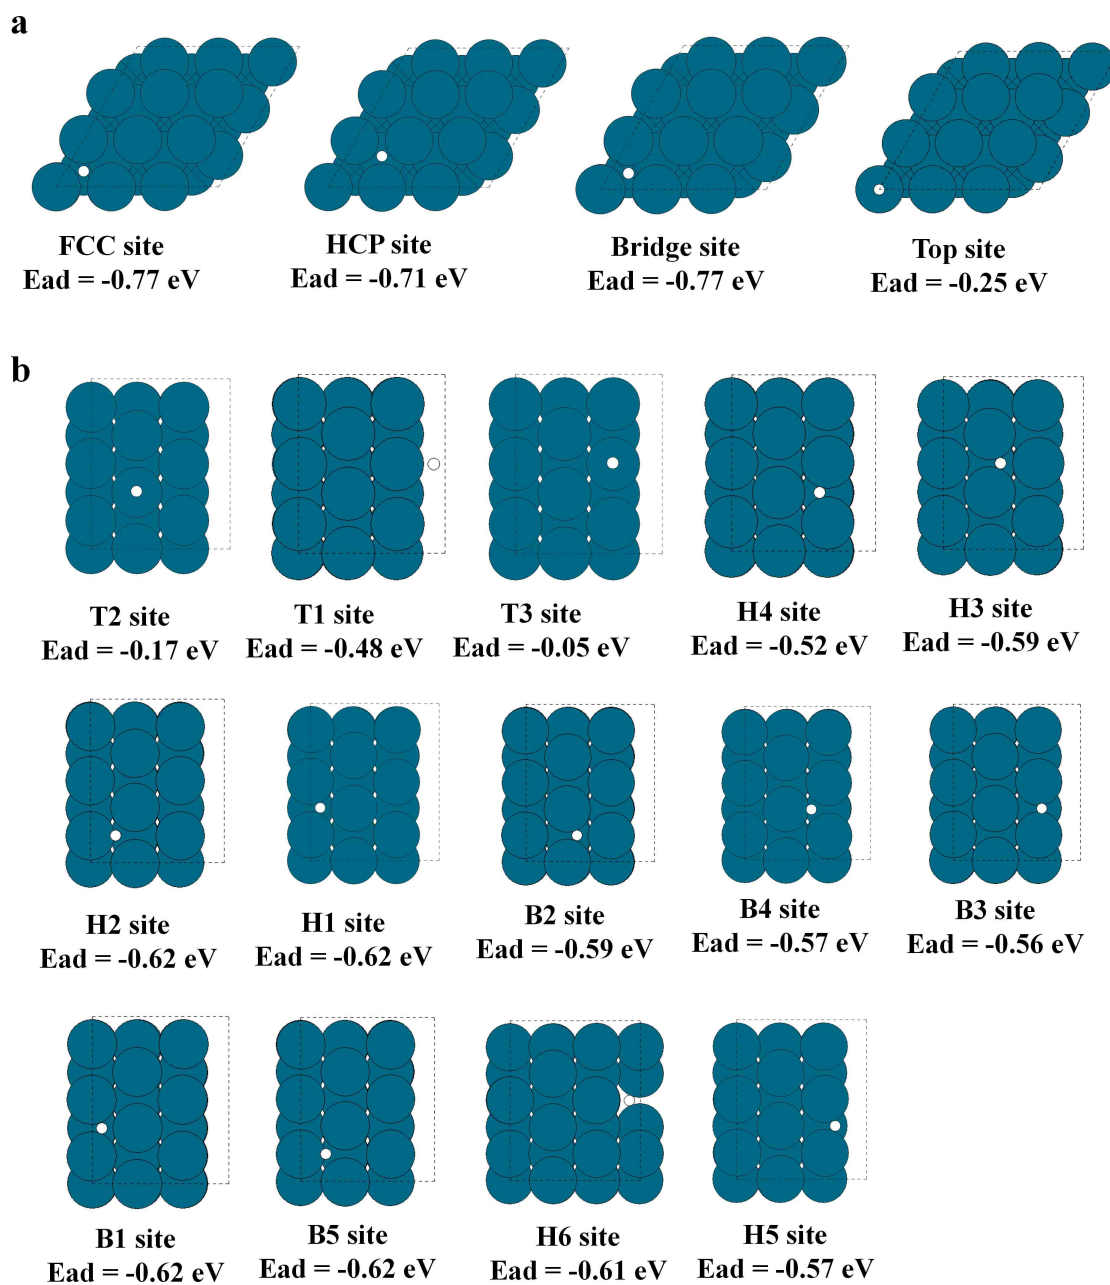

Fig. S15 | The most stable adsorption models and corresponding adsorption energy values for H adsorbed on different sites of Pd(111) (a) and Pd(211) (b).

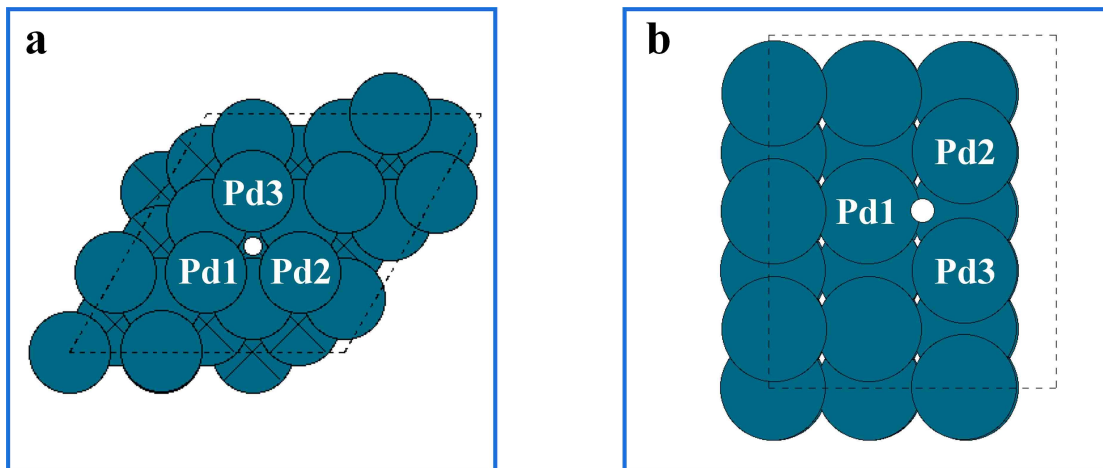

Fig. S16 | Models of 1 H* adsorbed on Pd (111) (**a**), and Pd (211) (**b**). Pd1, Pd2, and Pd3 are atoms bonded to the 1 H*.

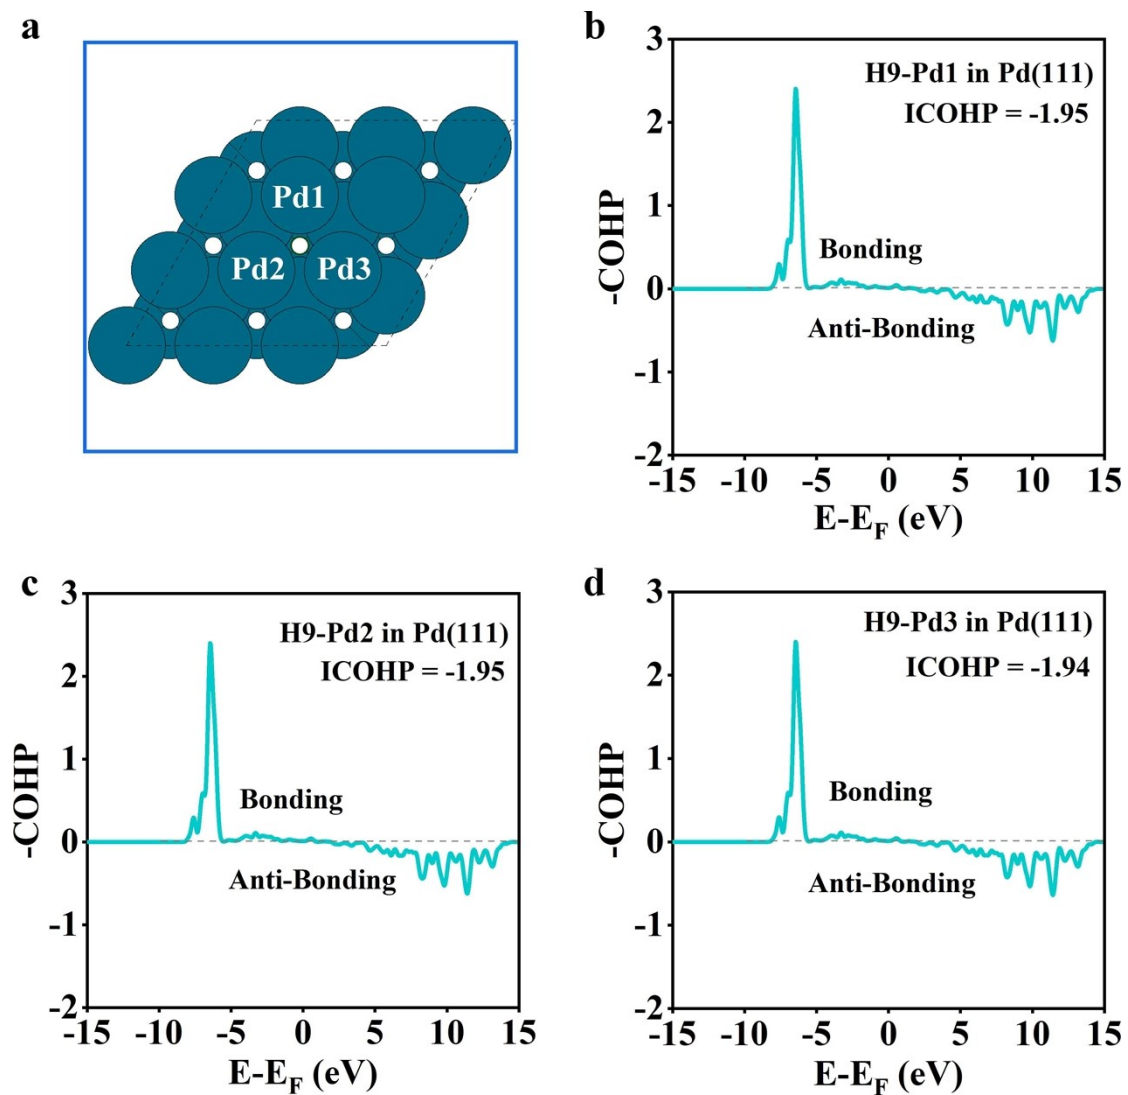

Fig. S17 | Models of high coverage H* adsorbed on Pd (111). Pd1, Pd2, and Pd3 are atoms bonded to the 9th H* (a), COHP for the ninth H* bonded to Pd1 (b), Pd2 (c), and Pd3 (d) of Pd (111).

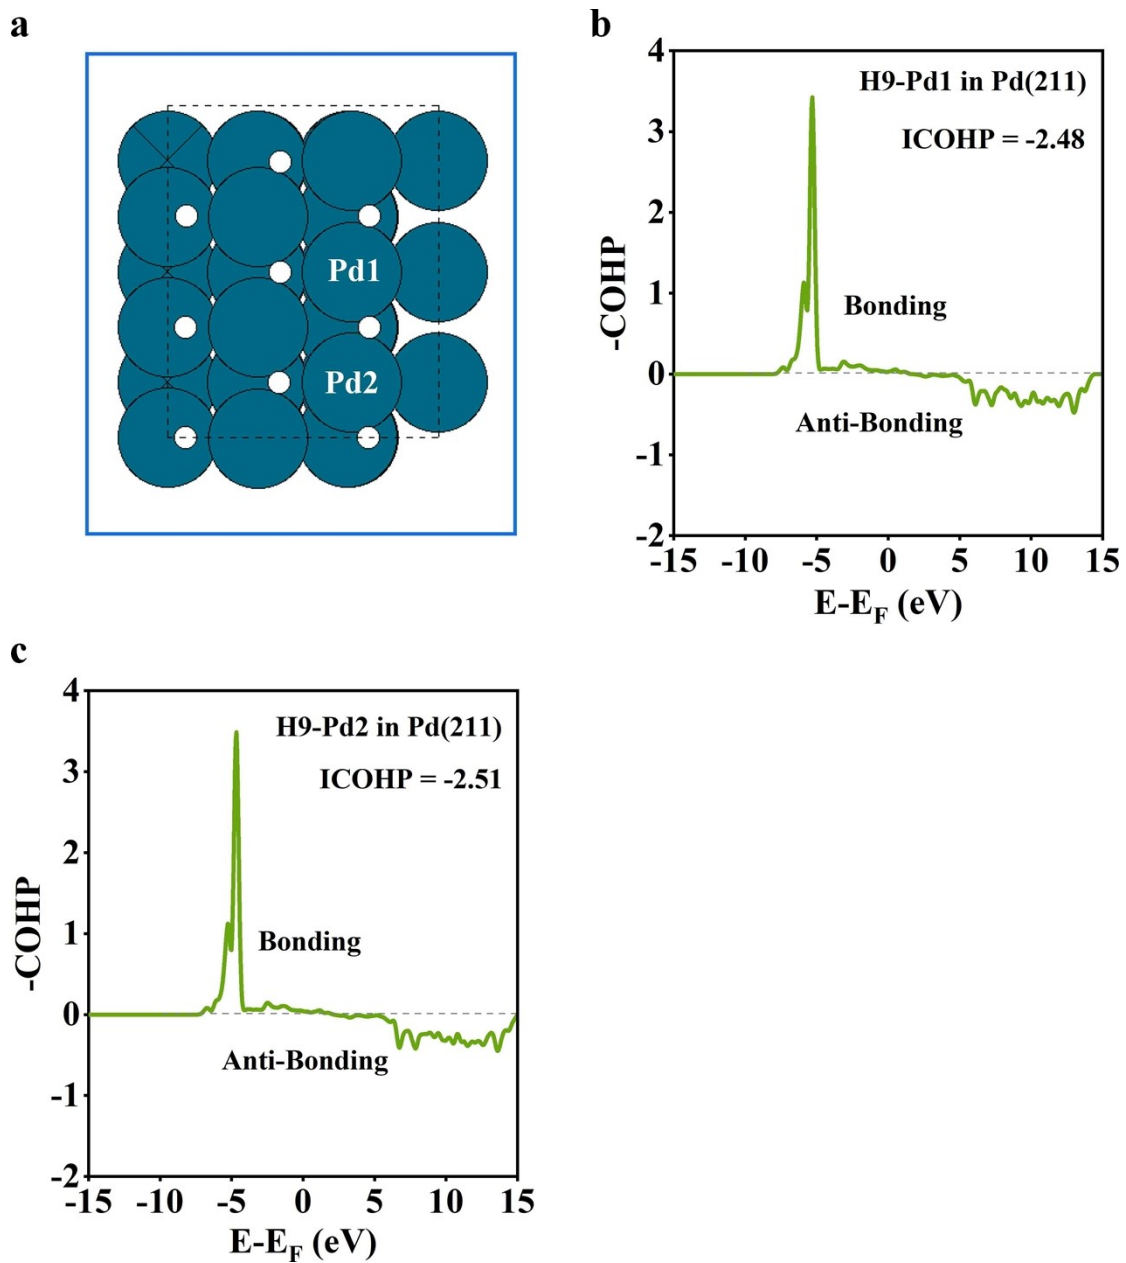

Fig. S18 | Models of high coverage H* adsorbed on Pd (211) (a). Pd1 and Pd2 are atoms bonded to the 9th H*. COHP for the ninth H* bonded to Pd1 (b), Pd2 (c) of Pd (211).

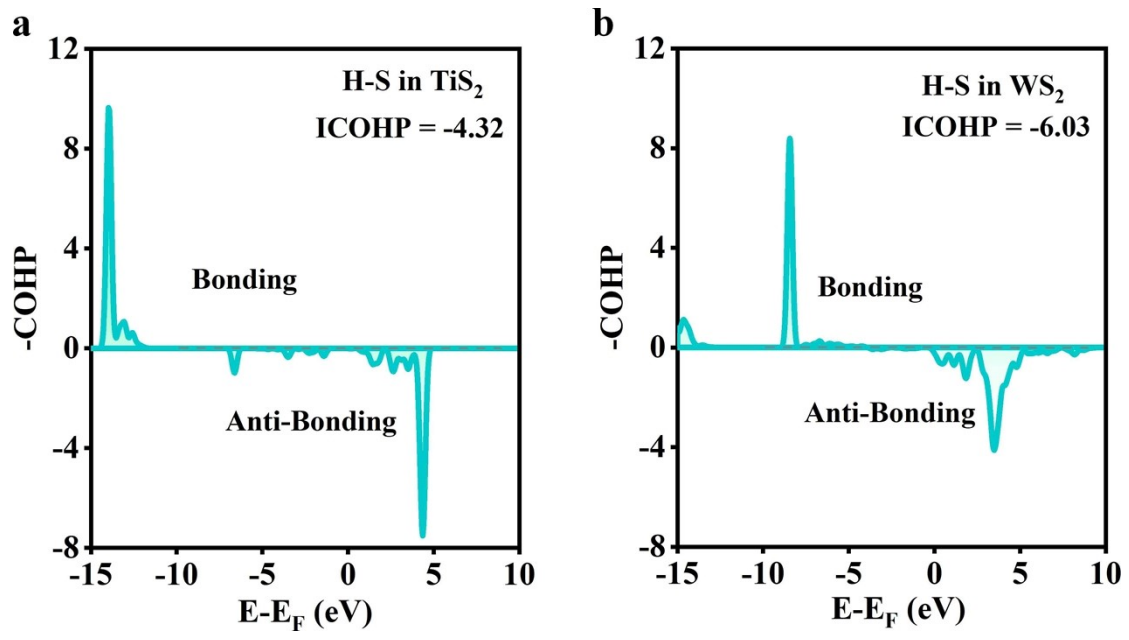

Fig. S19 | COHP for the H* and S in TiS_2 (a), and WS_2 (b).

Table S1. Comparative analysis of electrocatalytic Activity: Pd-MoS₂, Pd-WS₂, Pd-TiS₂ composites vs. previously reported Pd-decorated 2D catalysts for HER Application in 0.5M H₂SO₄.
