1. General remarks

¹H, ¹³C and ¹⁹F NMR spectra were recorded at 400 MHz or 600 MHz, 100 MHz or 150 MHz and 376 MHz or 564 MHz, respectively. HRMS spectra were recorded by EI, ESI, FI method. Infrared spectra were recorded on a Perkin-Elmer PE-983 spectrometer with absorption in cm⁻¹. Mass spectra were recorded by EI, ESI, and HRMS was measured on an Agilent Technologies 6224 TOF LC/MS instrument and a Waters Micromass GCT Permier. Melting points were determined on a digital melting point apparatus and temperatures were uncorrected. X-ray structure was determined on a Bruker Smart-1000 X-ray Diffraction meter. The employed solvents were dried up by standard methods when necessary. Commercially obtained reagents were used without further purification. All reactions were monitored by TLC plate analysis with silica gel coated plates (Huanghai GF254). Flash column chromatography was performed by using 300-400 mesh silica gel eluting with ethyl acetate and petroleum ether at increased pressure. Substrates **1ab** and **1ad** contain trace of impurity.

2. General procedures for the synthesis of substrates 1

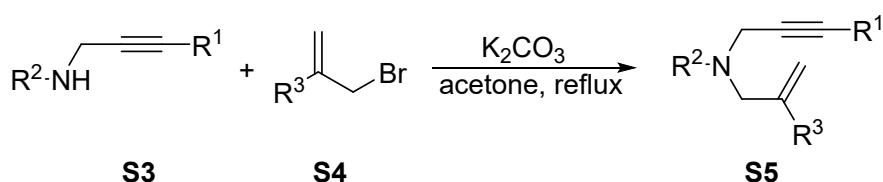

Synthesis of substrates 1

Step 1

To a solution of **S1** (60 mmol) in MeCN (100 mL) was added K_2CO_3 (90 mmol), KI (6.0 mmol) and **S2** (90 mmol) and the resulting solution was allowed to stir at 80°C for 12 h. After filtration, the organic phase was concentrated under reduced pressure and the residue was purified by a flash column chromatography on silica gel to give the desired products **S3** (PE:EA = 4:1).

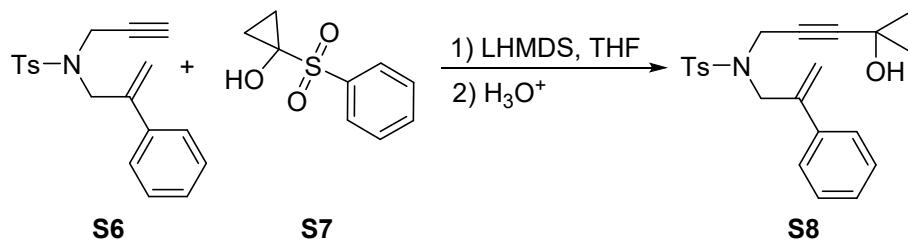

Step 2

To a solution of **S3** (50 mmol) in acetone (100 mL) was added K_2CO_3 (1.5 equiv.) and **S4** (1.5 equiv.) and the resulting solution was allowed to stir at 70°C for 12 h. After filtration, the organic phase was concentrated under reduced pressure and the residue was purified by a flash column chromatography on silica gel to give the desired products **S5** (PE:EA = 10:1).

Synthesis of substrate 1ab^[1]

Step 1

To a solution of compounds **S6** (20 mmol) in THF (30 mL) was slowly added LHMDS (24 mmol, 1.0 M in THF) at -78°C under the protection of argon and the resulting solution was allowed to stir

Consequently, the reaction mixture was allowed to warm up to room temperature and the mixture was left standing overnight. Then, saturated NH₄Cl solution was added to quench the reaction. Extracted with ethyl acetate, dried over anhydrous Na₂SO₄, and filtered, the organic phase was concentrated under reduce pressure and the residue was purified by a flash column chromatography on silica gel to give the desired product **S8** (PE:EA = 4:1~2:1).

4. General procedure for the synthesis of 3

Substrates **1** (0.1 mmol, 1.0 equiv.), K_2CO_3 (2.0 equiv.), *p*-toluenethiol (0.2 equiv.) and $[\text{Ir}(\text{dFCF}_3\text{ppy})_2(\text{dtbbpy})]\text{PF}_6$ (3.0 mol%) were added in a flame dried 15 mL Schlenk tube. The reaction tube was placed under vacuum and backfilled with argon three times. Then, DCE (5.0 mL) and **2a** (2.0 equiv.) were added in the Schlenk tube via a syringe. Next, the tube was placed 5.0 cm away from blue LEDs (30 W), and stirred vigorously under the irradiation of blue light for 12 h. After completion, the solvent was removed under reduced pressure. The crude product residue was purified by a column chromatography on silica gel (PE/EA = 10/1 to 4/1) to afford the purified product **3**.

5. Mechanistic studies

(a) Luminescence quenching experiments (Stern-Volmer Studies).^[2]

Emission intensities were recorded using Varian Cary Eclipse spectrometer for all experiments. All Ir[(dFCF₃ppy)₂(dtbpy)]PF₆ solutions were excited at 380 nm and the emission intensity was collected at 540 nm. Solutions of different concentration of **1a** and **2a** were prepared and introduced to a 1.0 cm path length quartz cuvette equipped with a Teflon® septum. In a typical experiment, to a 1*10⁻⁶ M solution of photocatalyst in DCE was added the appropriate amount of **1a** in a screw-top quartz cuvette under Ar atmosphere and the emission of the sample was collected. Subsequently, to a 1*10⁻⁶ M solution of photocatalyst in DCE was added the appropriate amount of **2a** in screw-top quartz cuvette under Ar atmosphere and the emission of the sample was collected

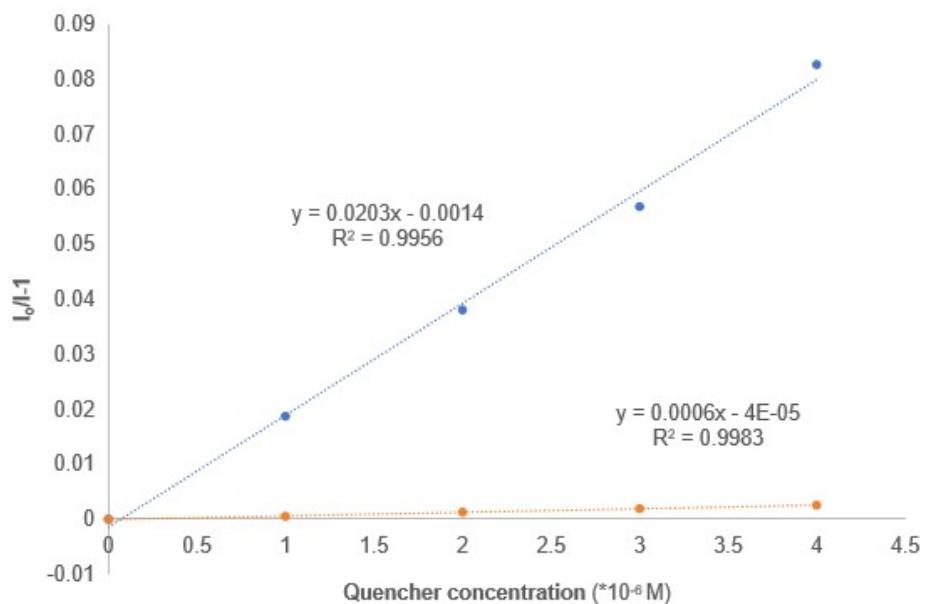

Figure S2. Stern-Volmer plot for the quenching studies above.

(b) Light on/off experiment and quantum yield.^[2]

To study the necessity of continuous irradiation with visible light for the progress of the reaction, the reaction proceeding was monitored by ¹H NMR spectroscopy using dimethyl terephthalate as an internal standard before and after light irradiation and dark periods.

The control experiments shown below with successive intervals of irradiation and dark periods did result in interruption of the reaction progress in the absence of light, demonstrating that light is a necessary component for the reaction after triggering the reaction in the first part.

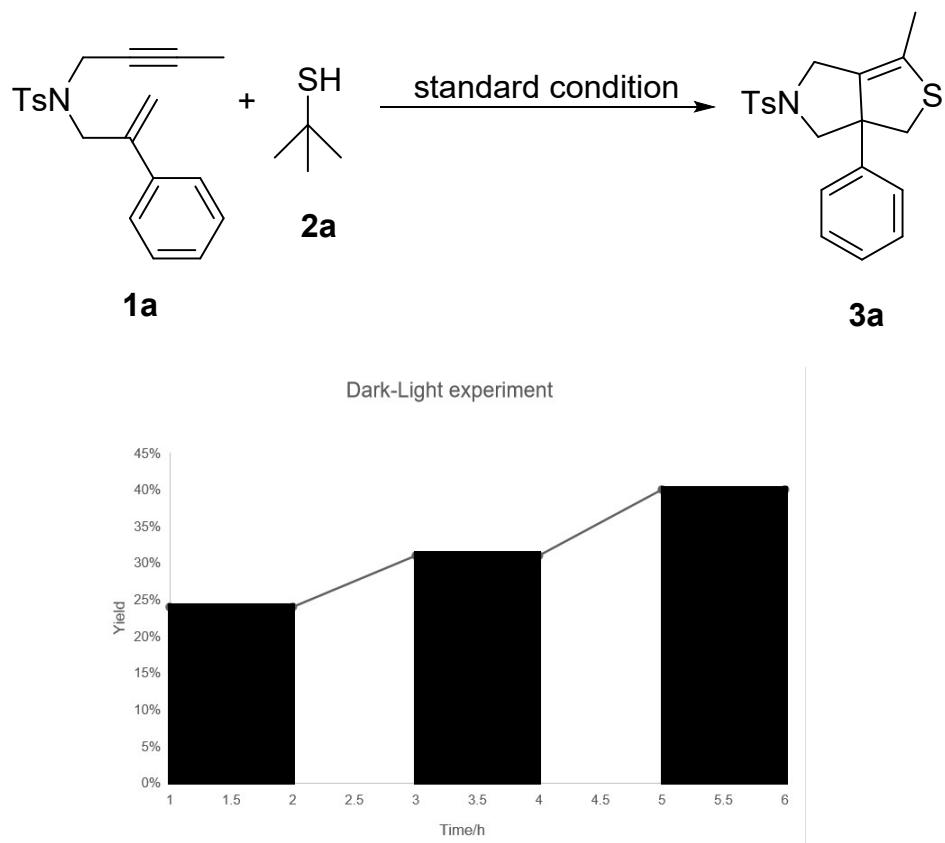

Figure S3. Light on-off experiment.

To further investigate whether the chain process is involved upon light irradiation, we measured the quantum yield of the template reaction of 1.0 h.

$$\phi = \frac{n_x}{n_p} = \frac{n_x}{\frac{\Delta E \times S \times t}{N_A h \nu}} = \frac{n_x \times N_A \times h \times c}{\Delta E \times S \times t \times \lambda}$$

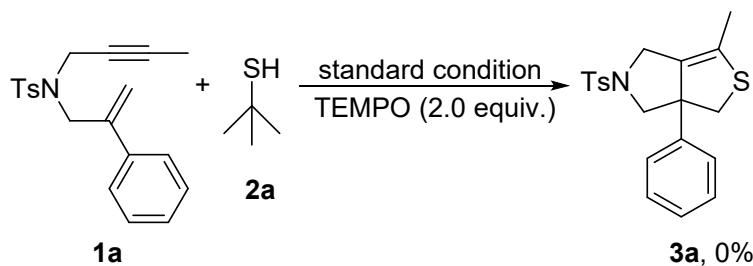

$$= \frac{0.045 \times 10^{-3} m}{(14.0 \times 10^{-3} W \cdot c) \cdot \frac{n^2}{m^2} \times 2c \cdot \frac{\lambda}{nm} \times 3600s \times 415 \times 10^{-9} m} \times 2.998 \times 10^8 m \cdot s^{-1}$$

$$= 0.13$$

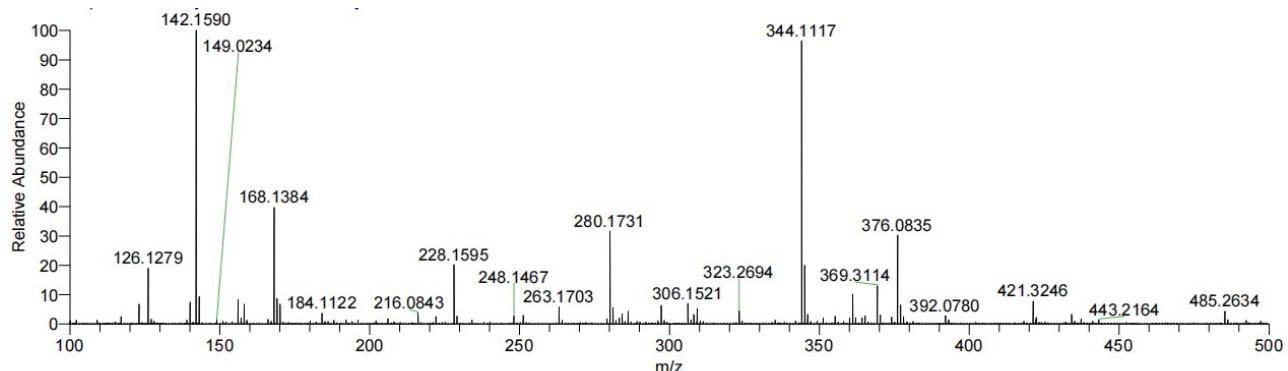

n_x is the amount of photochemical or photophysical events x occurred during irradiation, n_p is the number of photons absorbed by the reactant. E is the radiant power. S is the irradiated area: 2 cm²; t is the irradiated time: 3600 s; N_A is the Avogadro constant: $6.022 \times 10^{23}/\text{mol}$; h is the Planck constant: $6.626 \times 10^{-34} \text{ J}\cdot\text{s}$; ν is the frequency of incident light; c is velocity of light $2.998 \times 10^8 \text{ m/s}$. λ is the wavelength: 415 nm; n_x was analyzed by ¹H NMR, ΔE was measured by ILT1400 Portable Radiometer/Photometer.

10. Computational studies

All quantum mechanical calculations have been performed with Gaussian 16. The geometries of all species have been optimized at B3LYP/6-31G(d) level. The subsequent frequency calculations on the stationary points were carried out at the same level of theory to ascertain the nature of the stationary points as minima on the respective potential energy surfaces. The conformational space of flexible systems has first been searched manually and checked by xtb 6.0 program. Thermochemical corrections to 298.15 K have been calculated for all minima from unscaled vibrational frequencies obtained at this same level. The thermochemical corrections have been combined with single-point energies calculated at the SMD/B3LYP/6-311+G(d,p)// B3LYP/6-31G(d) level to yield free energy G_{298} at 298.15 K. The solvent effect was estimated by the IEFPCM method with radii and nonelectrostatic terms for SMD salvation model in DiChloroEthane: ($\epsilon = 10.13$).
