1. General Information

All the reagents were purchased from commercial sources, and used without further purification. All the obtained products were characterized by melting points, ¹H NMR, ¹³C NMR, ¹⁹F NMR, high resolution mass spectra (HRMS). Melting points were measured on an Electrothemal SGW-X4 microscopy digital melting point apparatus. ¹H NMR spectra, recorded at 600 MHz. ¹³C NMR spectra, recorded at 151 MHz. ¹⁹F NMR spectra, recorded at 565 MHz. The chemical shifts are reported relative to CDCl₃ (δ = 7.26 for ¹H NMR and δ = 77.16 for ¹³C NMR).

2. Procedure for the synthesis starting materials

2.1 Synthesis of 3-substituted indolines: Method for synthesis of compound 1a-1g^{1, 5}:

Step 1: A 50.0 mL flask equipped with a stir-bar with 3-Me indole (1.0 eq) and KOH (2.0 eq), DMSO was added to the flask and the solution was stirred under room temperature, then R¹-Br/I (2.0 eq) was added. The reaction mixture was stirred at room temperature and monitored by TLC. Upon finished the reaction mixture was quenched by water and extracted by ethyl acetate. Combined organic phase were dried over anhydrous Na_2SO_4 and concentrated under reduced pressure. The residue was then purified by chromatography on silica gel with a mixture eluent of petroleum ether and ethyl acetate.

Step 2: To a solution of 3-substituted indole (1.0 equiv.) in acetic acid (1.5 M,) was added in portions sodium cyanoborohydride (2.0 equiv.) at 0 °C, and the mixture was stirred at room temperature. After 2 h, water was added at 0 °C and the mixture was basified with NaOH (5 N aqueous solution). The organic material was extracted with CH_2Cl_2 , washed with brine, dried over anhydrous MgSO₄ and concentrated using a rotary evaporator to give crude reaction mixture. The column chromatography gives the pure product.

Method for synthesis of compound 1h-1i^{2, 5}:

To a solution of phenylhydrazine (10.0 mmol, 1.0 eq) and corresponding aldehyde (10.0 mmol, 1.0 eq) in toluene (40.0 mL) was added AcOH (0.5 mL). The resulting solution was heated at 110 °C for 30 min. Then, the mixture was cooled to room temperature and concentrated in vacuo. The remaining orange solid was used without further purification. Zinc chloride (5.0 mmol, 0.5 eq) was added. The resulting solution was heated at 110 °C for 3 h, and then cooled to room temperature. The mixture was washed with brine (30.0 mL) and extracted with $CH_2Cl_2(30.0 \text{ mL}\times3)$. The organic layers were combined and concentrated in vacuo. The residue was purified by silica chromatography to afford product.

Step i and Step ii as mentioned above.

Method for synthesis of compound 1j^{3, 5}:

In a 100.0 mL three-neck flask equipped with a magnetic stirrer, 5.0 mL dry toluene, Et_3SiH (3.49 g, 30.0 mmol) and Cl_3CCOOH (2.45g, 15.0 mmol) were added to the flask under N₂ atmosphere. The mixture was stirred to 70 °C, and the solution of cyclopentanone (0.925 g, 11.0 mmol) and indole (1.17g, 10.0 mmol) in 5.0 mL of toluene was added dropwise. The mixture was heat at 70 °C for 20 min to drive reaction to completion as judge by TLC. After the reaction completed, the mixture was cooled to room temperature, and quenched by saturated Na₂CO₃ aqueous solution. Then, the mixture was extracted with Et_2O (20.0 mL×3), and organic layer was dried over anhydrous MgSO₄. The solvents were removed under vacuum, and the residue was purified on silica gel to give **1**j.

Step i and Step ii as mentioned above.

Method for synthesis of compound 1k-1l^{4, 5}:

Step 1: a mixture of 3-indole ethanol (1.0 eq.), NaH (3.0 eq.), and MeI (2.6 eq) in DMF afforded N,O-dimethylindole product. Step 2 as mentioned above.

2.2 Synthesis of aryldiazonium salts⁶:

Appropriate arylamine (10.0 mmol) was dissolved in EtOH (3.0 mL) and hydrofluoroboric acid (48% w/w in water, 2.5 mL). The reaction mixture was cooled to 0 °C, tert-Butyl nitrite (2.7 mL) was added dropwise. The reaction mixture was stirred at room temperature for 1.0 hour. The resulting precipitate was collected by filtration. The crude product was dissolved into acetone (about 20.0 mL, for some low solubility product, more acetone was used), and the solution was gently heated, and then diethyl ether was added until the recrystallized product precipitated completely. The diazonium salt was collected by filtration, washed several times by cold diethyl ether and dried under vacuum.
