## 1 **Characterization techniques**

2       The Powder X-ray diffraction (PXRD) characterization was performed by  
3 PANanalytical X'pert pro diffractometer (Cu  $K\alpha = 1.54059 \text{ \AA}$ , PANanalytical X-Pert Pro,  
4 Netherlands) to confirm phase structures of the samples. Fourier transform infrared  
5 spectroscopy characterization was examined by SHIMADZU, FTIR spectrometer through  
6 ATR mode from  $400$  to  $4000 \text{ cm}^{-1}$  to identify the presence of functional groups. BET analyzer  
7 (Quantachrome Instruments, Autosorb IQ series) was used to investigate the specific surface  
8 area, pore size distribution and average pore volume of the  $\text{NiCo}_2\text{O}_4$  and  $\text{LiBH}_4+75\% \text{ NiCo}_2\text{O}_4$   
9 samples. The high resolution scanning electron microscopy and EDS spectra were collected by  
10 ThermoScientific Apreo S instrument. Transmission electron microscopy with corresponding  
11 SAED patterns were obtained from JEOL Japan, JEM-2100 Plus instrument. The X-ray  
12 photoelectron spectroscopy (XPS) was performed by Thermo Scientific MULTILAB 2000  
13 (with monochromatic Al  $K\alpha$  as the X-ray source) instrument to characterize the binding  
14 energies and chemical compositions of the samples. Moreover, the thermal stability and  
15 thermal properties of the samples were performed with help of thermal analyzer (TG-STA-  
16 7200, Hitachi, Japan) from RT to  $275 \text{ }^\circ\text{C}$  with  $15 \text{ }^\circ\text{C min}^{-1}$  rate under argon atmosphere with  
17  $100 \text{ mL min}^{-1}$  gas flow.

**NiCo<sub>2</sub>O<sub>4</sub> system**

4

**Figure S4** displays the EDS and elemental mapping profiles of NiCo<sub>2</sub>O<sub>4</sub> and

5 LiBH<sub>4</sub>+75% NiCo<sub>2</sub>O<sub>4</sub> samples. **Figure S4a** shows the elemental composition of NiCo<sub>2</sub>O<sub>4</sub>, the

1 urchin-like structure showed uniform distribution of Nickel, Cobalt and Oxygen elements. EDS  
2 profile confirms the presence of the Nickel, Cobalt and Oxygen with atomic ratio of 12.65,  
3 20.74 and 45.33 wt.%, respectively. As shown in **Figure S4b**, the  $\text{LiBH}_4+75\% \text{NiCo}_2\text{O}_4$  system  
4 consists of Boron, Nickel, Cobalt and Oxygen with atomic ratio of 1.35, 8.46, 16.86 and 68.87  
5 wt.%, respectively. The elemental mapping profiles depicts the existence of Boron, Nickel,  
6 Cobalt and Oxygen elements. As shown in the above results, Al content was detected due to  
7 sample substrates.
