1. Additional computations

Preliminary computations were performed using Gaussian16¹ program suite using pure M-06L functional,² which enabled the use of the RI (resolution of identity) approach,³ together with the double- ζ def2-SVP basis set,⁴ which greatly accelerated the initial calculations. To better describe the anionic structures, we also used double- ζ def2-SVPD basis set with additional diffuse functions.⁵ Solvent (MeCN) was simulated using the SMD variant of the IEF-PCM method.⁶

Higher level productive calculations were accomplished using ORCA computational program,⁷ which uses the efficient RIJCOSX approximation⁸ to accelerate hybrid functional computations. We employed

the M06-2X hybrid functional² together with the minimally augmented ma-def2-TZVP basis set.⁹ Weigend's universal auxiliary basis set was used for the RI approximation calculations.¹⁰ The MeCN solvent was simulated with the CPCM method¹¹ and the description of the non-covalent interactions was improved by the dispersion correction.¹²

The equilibrium among difluorosilicates **18** and fluorosilane-fluoride complexes **19** was studied for three difluorosilicates, viz. tetramethylammonium difluorotriphenylsilicate (**18a**), tetramethylammonium difluoro(4-methoxyphenyl)diphenylsilicate (**18b**) and tetramethylammonium difluorodiphenyl[4-(trifluoromethyl)phenyl]silicate (**18c**), with the aim to find how substitution with electron donating or electron withdrawing group will influence transition state energy of the equilibrium.

First, conformational space of all three starting difluorosilicates **18** was studied at both levels. In all cases, the tetramethylammonium cation is oriented in a skewed position relatively to the F-Si-F linear bonds. For triphenylsilicate **18a**, two main conformers were found, viz. more stable conformation **18aA** with butterfly wings-like arrangement of two phenyl rings oriented towards the ammonium cation, and a less stable conformation **18aB** with propeller-like arrangement of the three phenyl rings. Both structures and their relative free Gibbs energies are shown on Figure S1 (structures computed by the productive ORCA calculations).

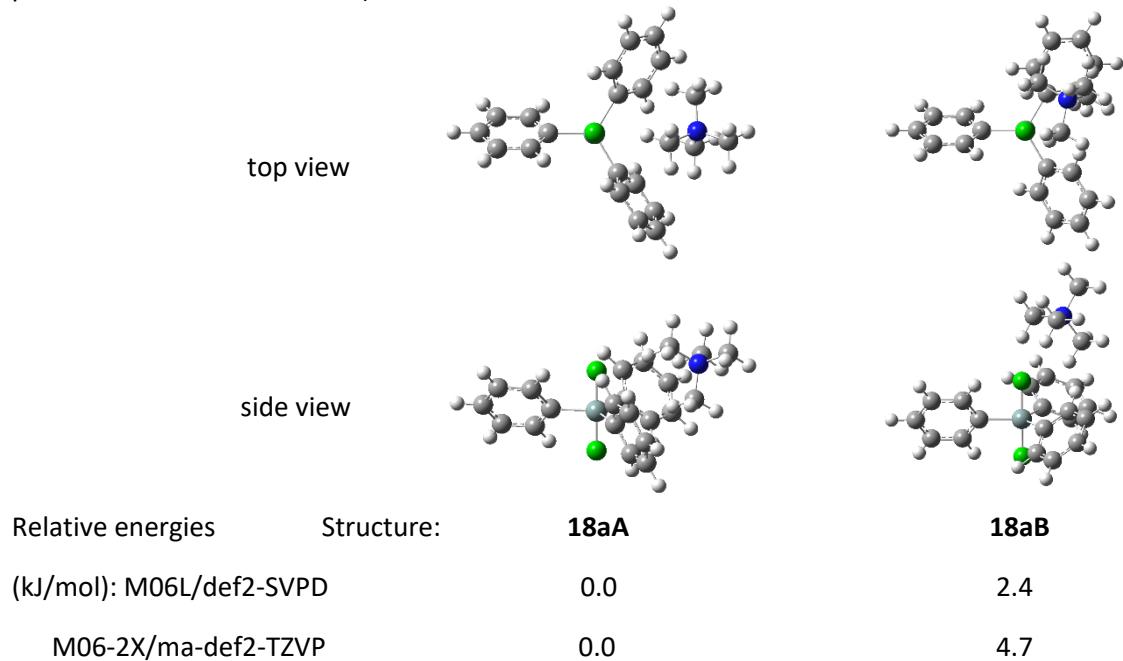

Figure S1: Butterfly wing **18aA** and propeller **18aB** structures and their relative free Gibbs energies

Twelve possible minimal geometries were found for the difluorosilicate **18b** modified with 4-methoxyphenyl group, six butterfly wing-like and six propeller like, at the lower level calculations. 4-Methoxyphenyl group can be coordinated to the ammonium cation from one or the other side, or can be arranged against the ammonium cation. Furthermore, the methyl of the methoxy group can be arranged towards the ammonium cation or against it. In an analogy to the structures **18a**, the butterfly wing-like structures were more stable than the propeller-like structures. In an analogy to the crystal structure of TBAT analogue **4b**, the preferred structure **18bA** contains the methoxy group adjacent to the ammonium cation with the methyl group oriented towards it. This structure, the respective propeller-like structure **18bB** and their relative free Gibbs energies are shown on Figure S2.

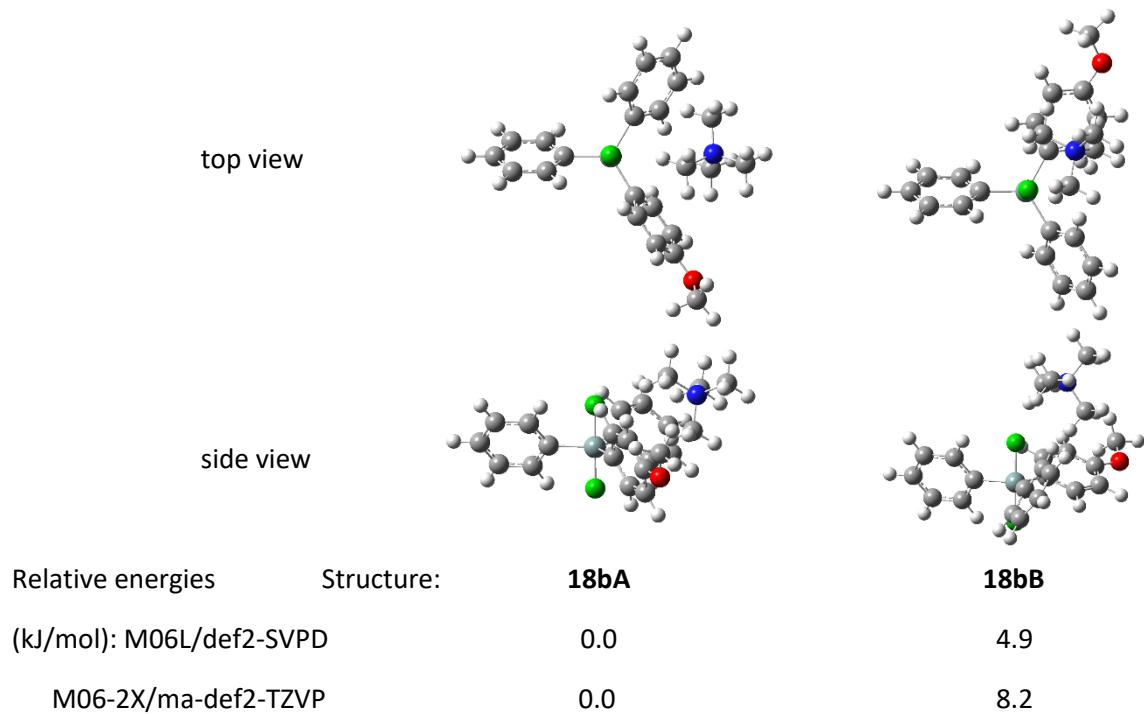

Figure S2: Butterfly wing **18bA** and propeller **18bB** structures and their relative free Gibbs energies

Similarly, three possible butterfly wing-like structures and three propeller-like structures can be found for the difluorosilicate **18c** modified with the electron withdrawing 4-(trifluoromethyl)phenyl group. The trifluoromethyl group could be positioned on one or the other phenyl group adjacent to the ammonium cation, or on the phenyl group positioned against it. The most stable computed butterfly wing-like structure **18cA** contains the CF₃ positioned against the ammonium cation and does not correspond to the crystal structure of **4d**, which has the CF₃ group oriented towards the ammonium cation. Again, the butterfly wing-like structure **18cA** is more stable than the respective propeller-like structure **18cB** (see Figure S3 for the structures and their Gibbs free energies).

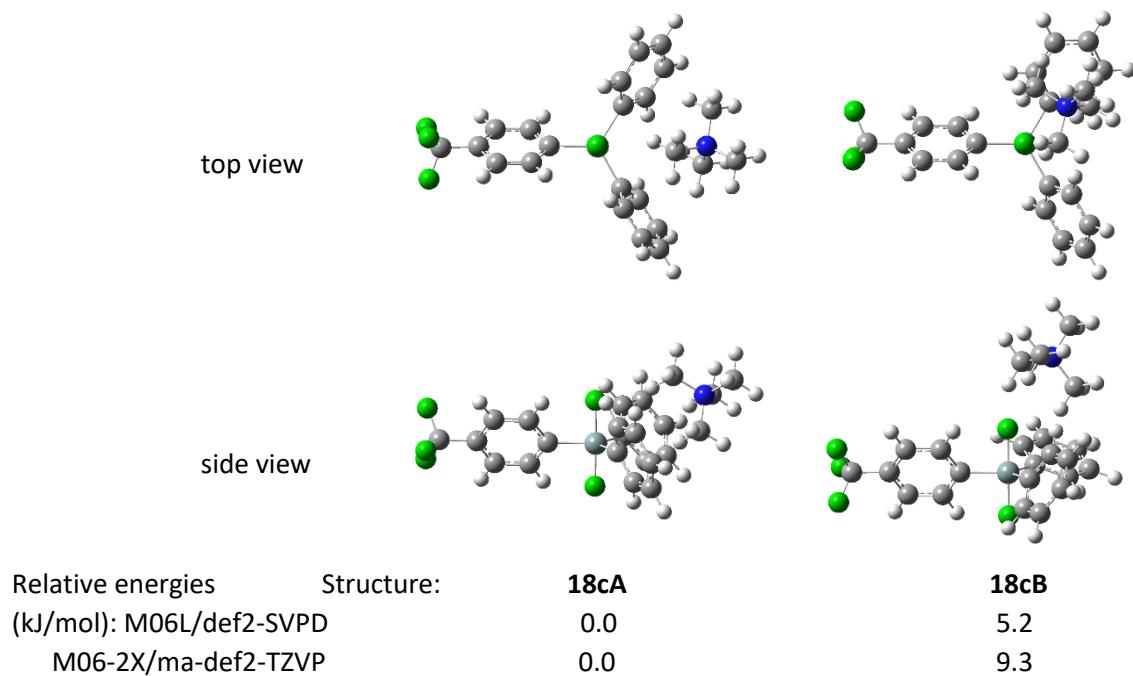

Figure S3: Butterfly wing **18cA** and propeller **18cB** structures and their relative free Gibbs energies

Most stable butterfly wing-like structures **18aA**, **18bA** and **18cA** were used as the starting geometries for the search of transition states. The PES of the decomposition of difluorosilicates **18** to fluorosilane-fluoride complexes **19**, computed at the higher level, is shown in Figure 6 of the article, while the corresponding PES computed at the lower level is shown in Figure S4.

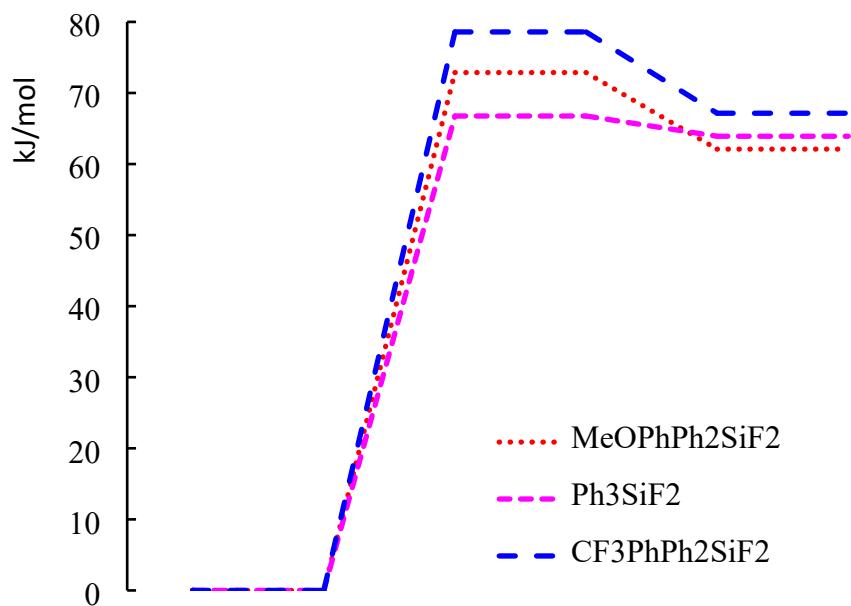

Figure S4. PES of decomposition of difluorosilicates **18a-18c** to fluorosilane-fluoride complexes **19a-19c**, computed at the lower M06L/def2-SVPD level.

The results of the computations at the lower level differ from those at the higher level. The presence of the electron donating methoxy group resulted in a little higher transition state energy, while substitution with the electron-withdrawing trifluoromethyl group gave higher transition state energy. As expected, the use of pure functional led to somewhat lower transition state energies compared to the results using hybrid functional.

4. Crystallographic data of difluorosilicates 4b-4d

The X-ray data were collected on a Bruker D8 VENTURE system equipped with charge-integrating pixel array detector Photon II 7, a multilayer monochromator and an Incoatec microfocus sealed tube using combined φ and ω scans at 180 K. The positional and anisotropic thermal parameters of all non-hydrogen atoms were refined. All hydrogen atoms were located in a difference map, but repositioned geometrically, then they were initially refined with soft restraints on the bond lengths and angles to regularise their geometry (C-H in the range of 0.93–0.98 Å) and $U_{iso}(\text{H})$ (in the range 1.2–1.5 times U_{eq} of the parent atom), after which the positions of the hydrogen atoms were refined with riding constraints.

Tetrabutylammonium difluoro(4-methoxyphenyl)diphenylsilicate (4b): CCDC 2312704

CuK α radiation ($\lambda = 1.54178 \text{ \AA}$) was used for the data collection. The refinement of 361 parameters on all 6188 reflections (5558 observed reflections, $I > 2 \sigma(I)$) converged to the final R_1 of 0.0393 and R_{w1} of 0.1090. Plate-like colorless crystal, dimensions 0.140 mm x 0.221 mm x 0.392 mm.

Tetrabutylammonium difluorobis(4-methoxyphenyl)phenylsilicate (4c): CCDC 2312705

CuK α radiation ($\lambda = 1.54178 \text{ \AA}$) was used for the data collection. The refinement of 379 parameters on all 6424 reflections (5119 observed reflections, $I > 2 \sigma(I)$) converged to the final R_1 of 0.0800 and R_{w1} of 0.2223. Needle-like colorless crystal, dimensions 0.074 mm x 0.184 mm x 0.544 mm.

Tetrabutylammonium difluorodiphenyl[(4-trifluoromethyl)phenyl]silicate (4d): CCDC 2312706

MoK α radiation ($\lambda = 0.71073 \text{ \AA}$) was used for the data collection. The refinement of 380 parameters on all 7320 reflections (6034 observed reflections, $I > 2 \sigma(I)$) converged to the final R_1 of 0.0458 and R_{w1} of 0.0973. Needle-like colorless crystal, dimensions 0.197 mm x 0.199 mm x 0.255 mm.

Data collection: APEX4²¹; Unit Cell refinement and data reduction: SAINT²³; program used to solve structure: SIR92²⁴; program used to refine structure: CRYSTALS²⁵. CCDC 2312704–2312706 contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/structures.
