General information

All the used superbase ionic liquids were prepared in our research group by following the procedure published by Gazagnaire et al.¹ Liquid state ¹H were recorded at 27°C using a Bruker Avance Neo 600 [599.69 MHz]. ¹H and spectra were referenced to the residual solvent signals of DMSO-d₆ 2.50.

a. General procedure for the synthesis of ionic liquid

In a 20ml vial 1 molar equivalent of superbase is mixed with 1 molar equivalent of acid and stirred for an hour. The color of the ionic liquid varies from colorless to dark orange and the melting point varies from room temperature to 60°C.

For the acetate salt the addition of the acetic acid to the superbase must be slow due to exothermicity. In the contrary, for strong acid (e.g., chloroacetic acid, dichloroacetic acid, etc.) the addition of the acid can be fast, and the reaction mixture heated to 60°C, otherwise the acid (solid at room temperature) doesn't dissolve into the superbase.

Acetate salt liquid at room temperature: [mTBNH][OAc], [mTBOH][OAc], [dm3-m0-mTBDH][OAc], [dm3-mTBDH][OAc], [m2-mTBDH][OAc]

Acetate salt solid at room temperature: [dm39-mTBDH][OAc]

Strong acid salt liquid at room temperature: [mTBNH][ClOAc], [mTBNH][Cl₂], [mTBDH][ClOAc]

Strong acid salt solid at room temperature: [mTBNH][Cl₃OAc], [mTBDH][Cl₂], [mTBDH][Cl₃OAc]

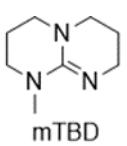

b. General procedure of SB/SB-IL hydrolysis

In an 8ml vial 1g of SB-IL is mixed at room temperature with a defined molar equivalent of water (0.2. 0.5. 1. 5 or 10) just before the start of the kinetic studies. Then the vial is placed into an oven at 90°C. Then every hour, an NMR sample is taken from the vial and analyzed by NMR. For each analysis, the NMR tube was filled with 0.025g of sample and 0.5g of DMSO d₆ was added to allow NMR spectrometer locking and shimming. The amount of hydrolysed product was calculated according to the published formula by Sturm et. all (reference 2 in the main article). The Integration calculation was done with MesReNova software, using the Sum method, algorithm: signal picking. For the hydrolysis experiment containing a co-solvent ('entertainer', such as DMSO, phenol, ethylene glycol, etc.) the molar equivalent added is always calculated according to the amount of SB-IL or SB.

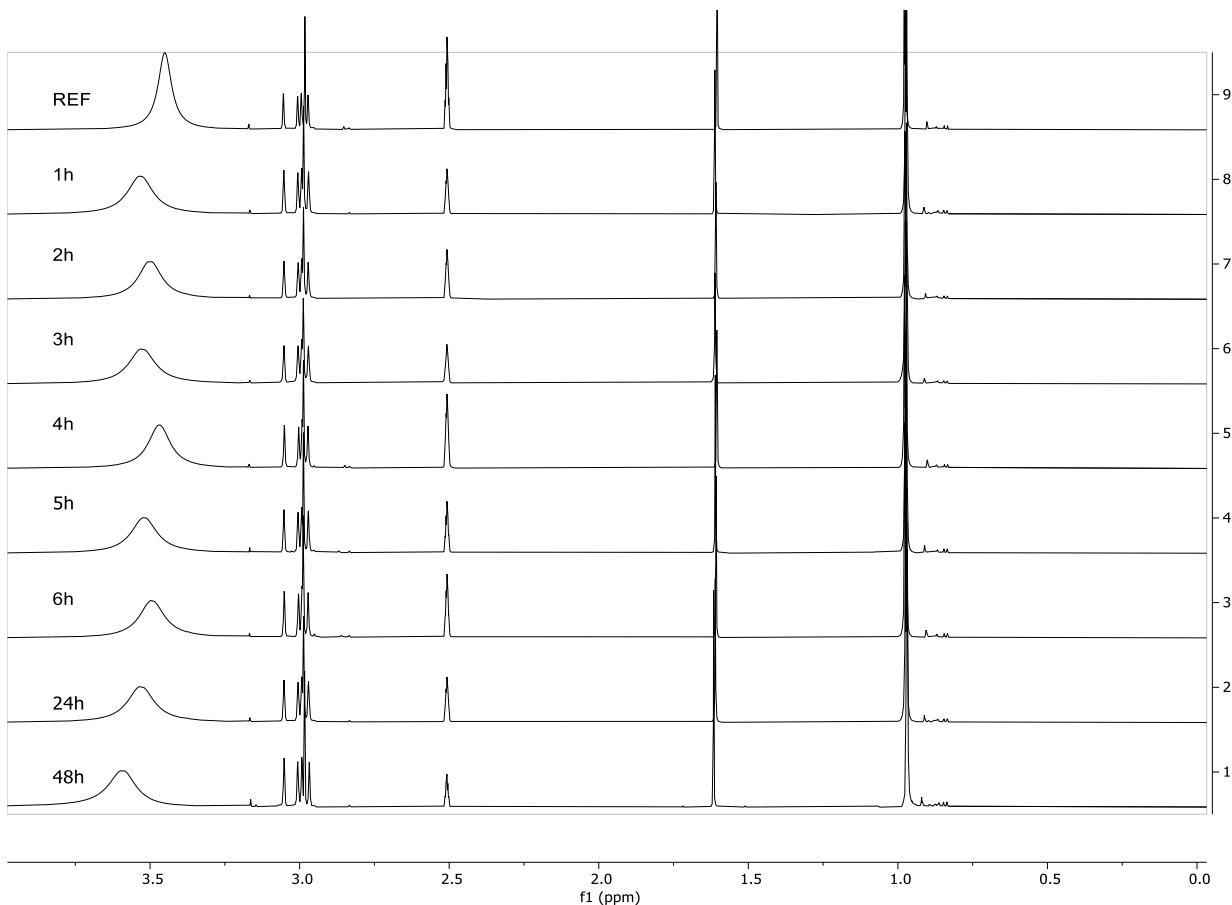

Figure S132 ^1H NMR 1 molar equivalent of [m2-mTBDH][OAc] and 10 molar equivalent of water.

II. Half-time calculation

When the half-time is reached during the experiment, the value is readable from the plot using the experimental data. When the half-time is not reached during the experiment, the value is calculated using the function fitting as close as possible to our data. The obtained value is an estimation and may differ from experimental data.

1. SB and their salts with pure water at 90°C

Molecule	Water equivalents	Half-time in hours
mTBD	0.2	8
mTBD	0.5	6
mTBD	1	8

Table S135 Half-life of SB and their corresponding salt in presence of co-solvent

3. SB and their acetate salts over a three days period at different temperature

Molecule	Water equivalents	Temperature	Half time
mTBD	1	70°C	0.345 days (24.84h)
mTBD	5	70°C	< 24h
mTBD	10	70°C	< 24h
[mTBDH][OAc]	0.2	70°C	8.1 days (194.4h)
[mTBDH][OAc]	0.5	70°C	Over 12 days. non-predictable

[mTBDH][OAc]	1	70°C	Over 12 days. non-predictable
mTBN	1	70°C	Over 12 days. non-predictable
mTBN	5	70°C	< 24h
mTBN	10	70°C	< 24h
[mTBNH][OAc]	1	70°C	Over 12 days. non-predictable
[mTBNH][OAc]	5	70°C	Over 12 days. non-predictable
[mTBNH][OAc]	10	70°C	Over 12 days. non-predictable

Table S136 Half-life of SB and their corresponding salt.

III. Curves of hydrolysis

In this section, we collected the hydrolysis data obtained by NMR and plotted them together on a same graph for comparison. We first did this for each superbase (individually) in different water conditions. Then we plotted the data from an individual superbase + different co-solvent (individual again) amount with a constant water amount (here 1 molar equivalent according to the superbase). After that we repeated the same plotting but for the corresponding carboxylate salt.

1. mTBD with different amounts of water

20. [m2-mTBDH][OAc] with different amount of water

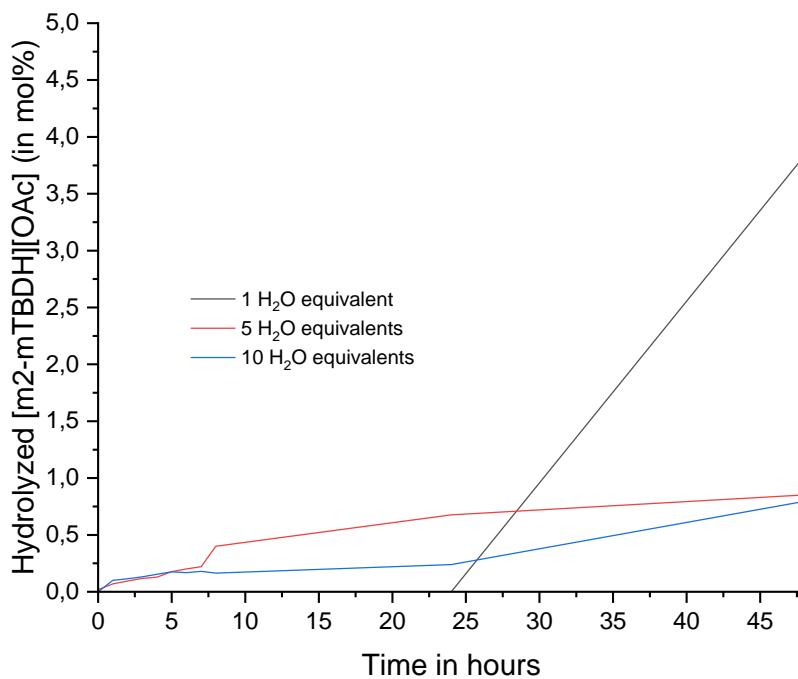

Figure S151 hydrolysis of [m2-mTDBH][OAc] with different water amounts.

IV. Conductivity.

To follow the evolution of the hydroxyl salt formation of a superbase in water, we performed a conductivity experiment by titrating the superbase with water. Simultaneously, at each water equivalents and after waiting until the conductivity value was stable. we performed a FTIR measurement.

1. General procedure:

First the conductivity of the pure water was measured, then the pure superbase. After that, in a falcon tube was loaded 15ml of a given superbase (mTBD, mTBN, mTBO or dm3-mTBD) with a small stirring magnet. Then the conductivity probe was immersed (pay attention to fully submerge the “reading window” of the probe). The water amounts were added using a calibrated mechanical pipette. N.B! the conductivity may take few minutes before stabilizing.

2. Curves and raw data.

a. *Water titration of mTBD*

After plotting the conductivity data, we could observe some turning points on the conductivity curves. We used a tangent tool to get an estimation of the precise location of these points. Note that variations may occur from one experiment to another due to the instrument used, the ambient temperature / moisture or the “stabilization” time used to collect the conductivity data. For clarity, in the following section a picture of the entire conductivity curve is shown followed by zooms on the turning points area.

V. PH measurements

a. KOH or mTBD in pure distilled water

A pH meter was used to follow the pH of a 100ml distilled water to which a solution of KOH or mTBD (0.1 M, 10 mL 0.056 or 0.15g respectively) was gradually added.

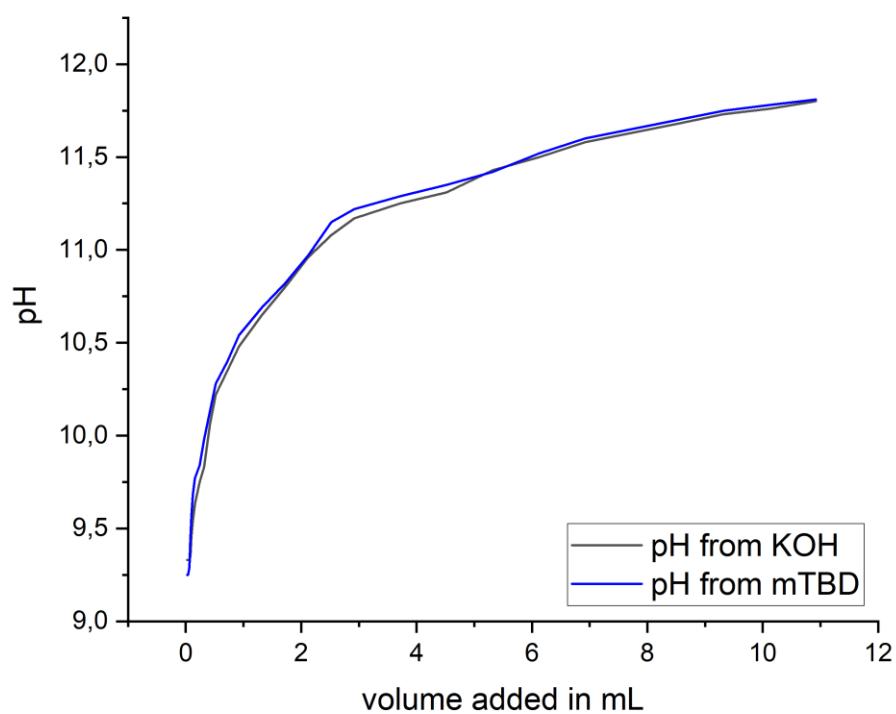

Figure S163 pH evolution of pure water in function of the addition of KOH or mTBD.

b. KOH or mTBD in distilled water with acetic acid

A pH meter was used to follow the pH of a 100ml distilled water with a 0.1 M concentration of acetic acid (0.3 g of acetic acid) to which a solution of KOH or mTBD (0.1 M, 10 mL 0.056 or 0.15g respectively) was gradually added.

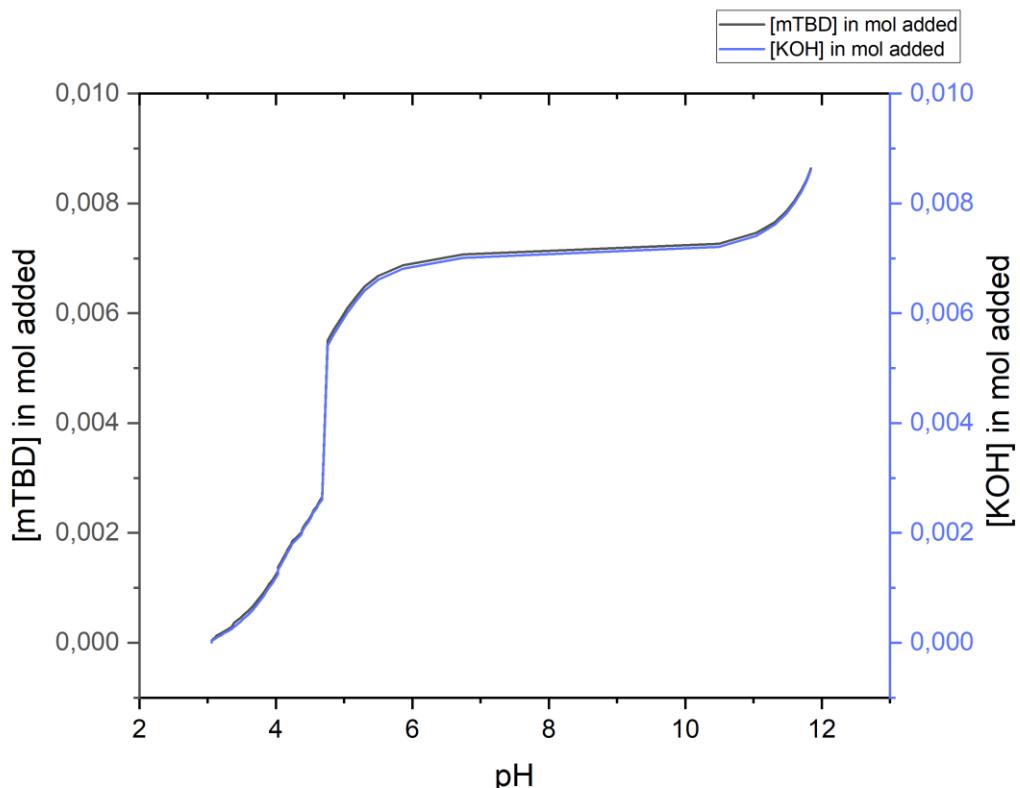

Figure S164 pH evolution of an acidic solution in function of the addition of KOH or mTBD.

c. pH of KOAc and [mTBDH][OAc] solutions

10 mL solution of 0.5 M, 1 M, 2M, 3M, 5 M and 10 M of KOAc or [mTBDH][OAc] were prepared, and their pH was measured with a pH meter.

Molar concentration	pH value	
	KOAc	[mTBDH][OAc]
0.5	7.7	6.88
1	7.92	7.0
2	8.21	8.13
3	8.66	8.5
5	9.46	10.71
10	10.90	12.3

Table S141 pH evolution of a solution of KOAc or [mTBDH][OAc] in function of their concentration.

VI. InfraRed measurements

The measurements were performed using an FTIR instrument. As previously mentioned, the sample measured by IR spectroscopy is the same sample where the conductivity was measured. In the following section, for each experiment, a figure of all the spectra combined are shown. followed by an expansion of the CH₂ region (2800 – 3000 cm⁻¹) and the imine region (1400-1600cm⁻¹). The raw data are available upon request.

1. FTIR measurements of water titration

a. *mTBD*

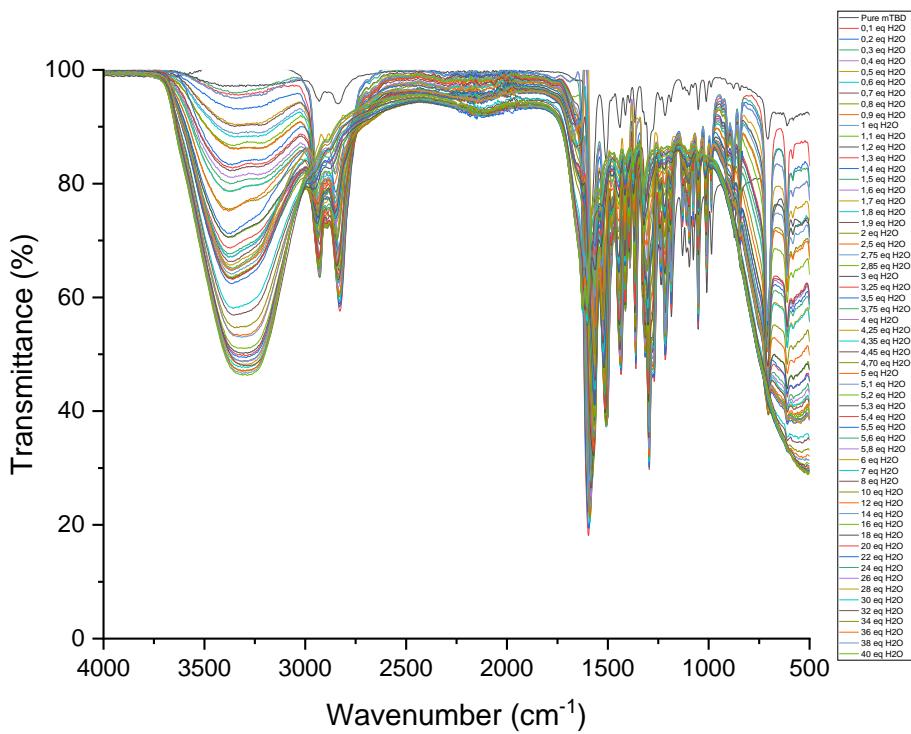

Figure S165 IR of water titration of mTBD.

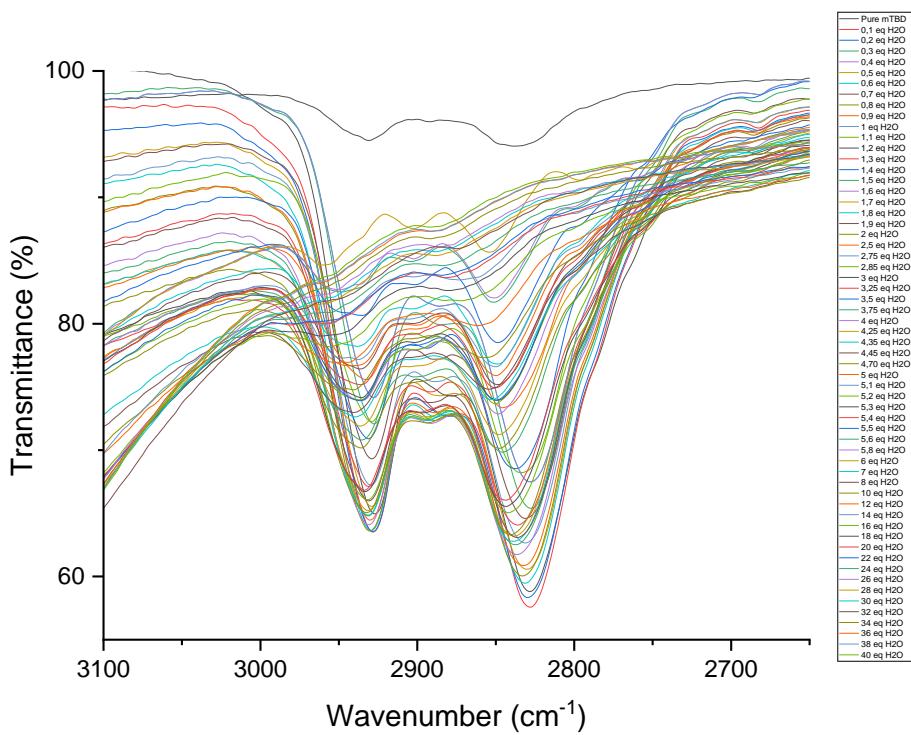

Figure S166 expansion of the mTBD CH₂ region (2800 – 3000 cm⁻¹)

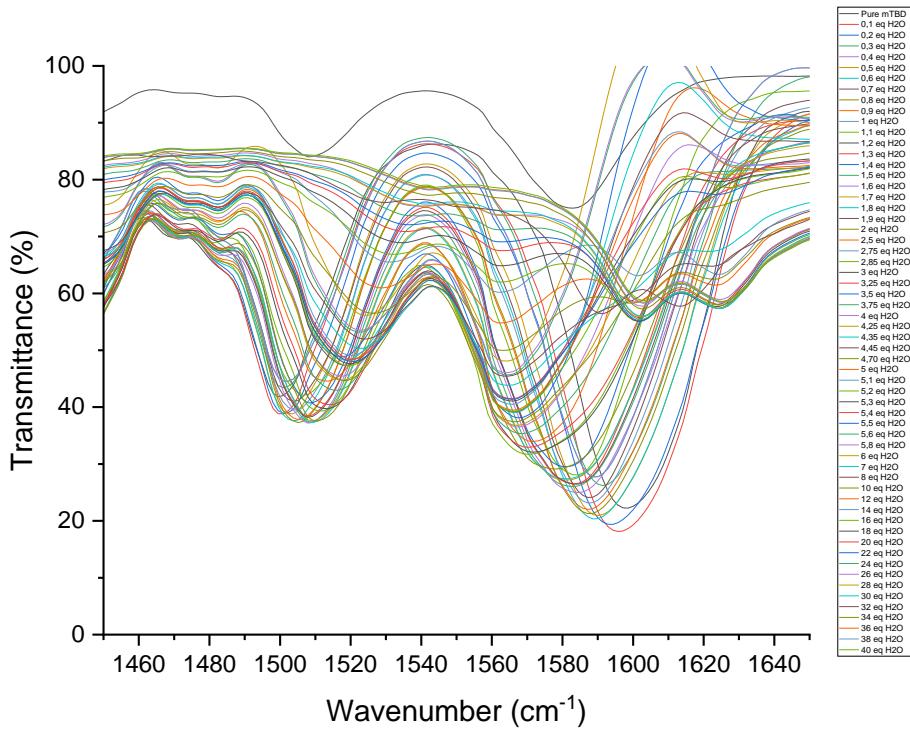

Figure S167 expansion of the mTBD imine region ($1400 - 1600 \text{ cm}^{-1}$)

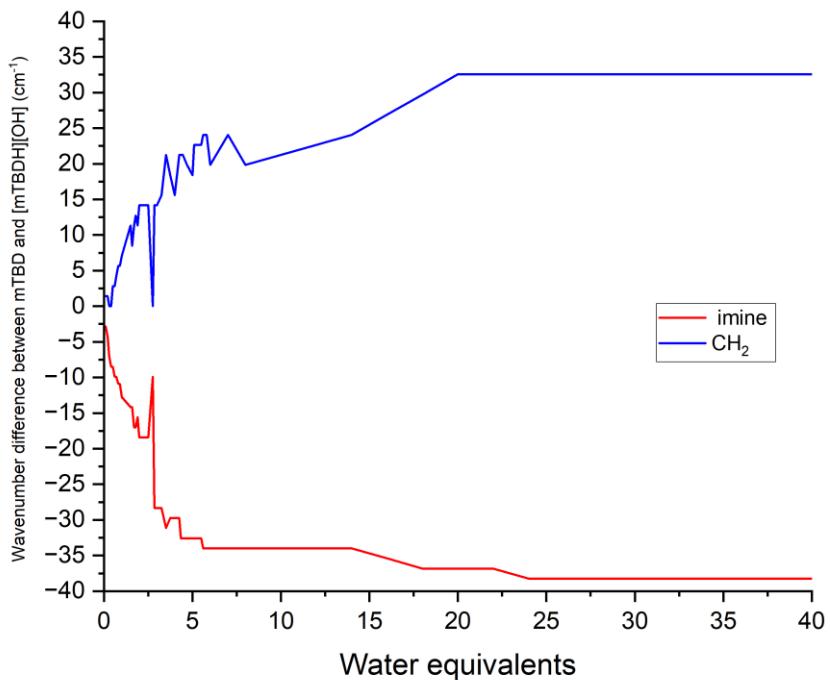

Figure S 168 IR shift of the imine and CH_2 IR signal of mTBD in function of the water equivalents.

b. *mTBN*

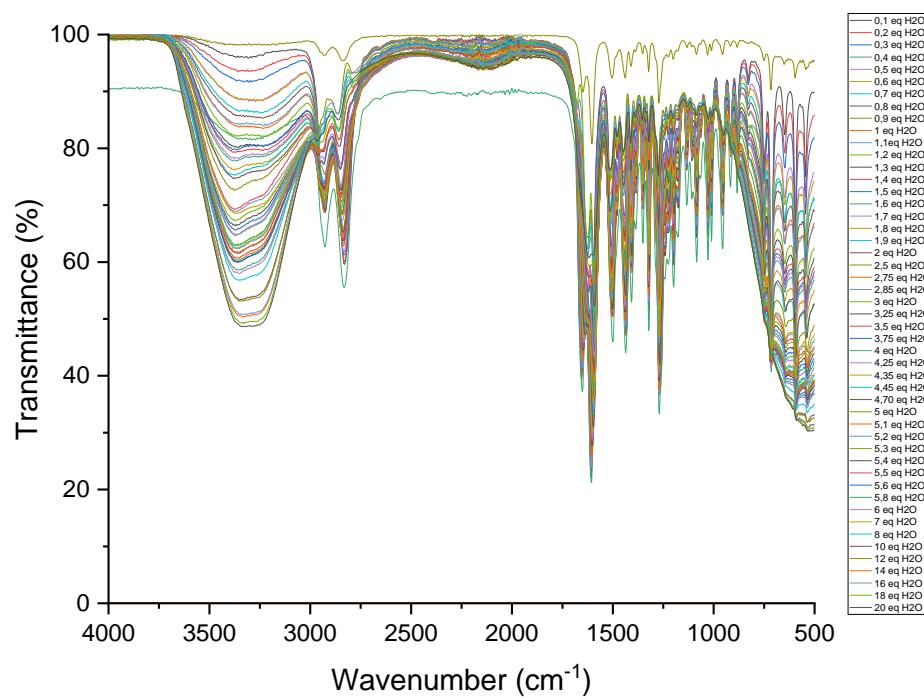

Figure S169 IR of water titration of *mTBN*.

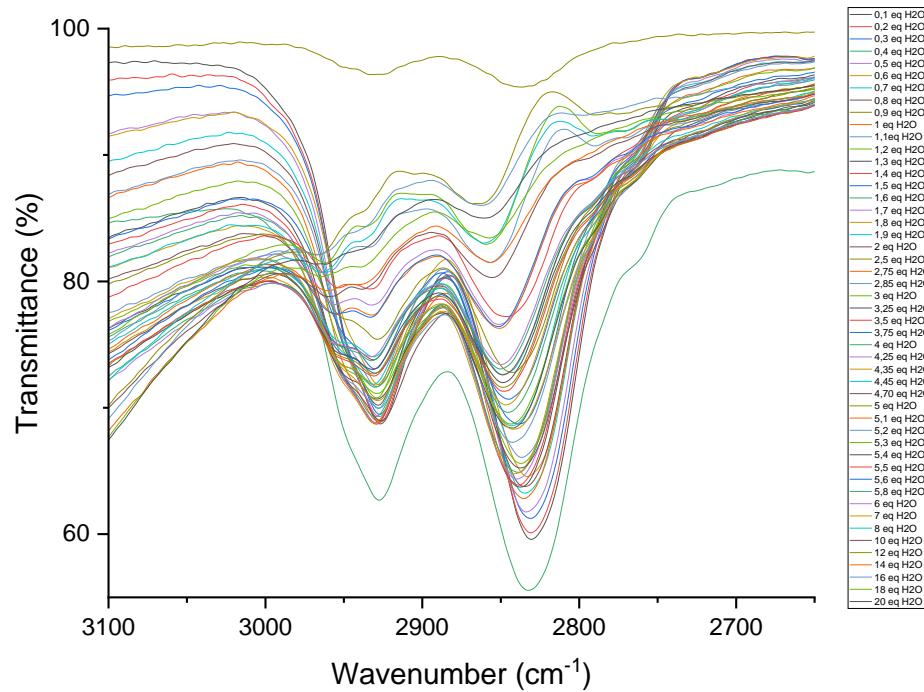

Figure S170 expansion of the *mTBN* CH₂ region (2800 – 3000 cm⁻¹)

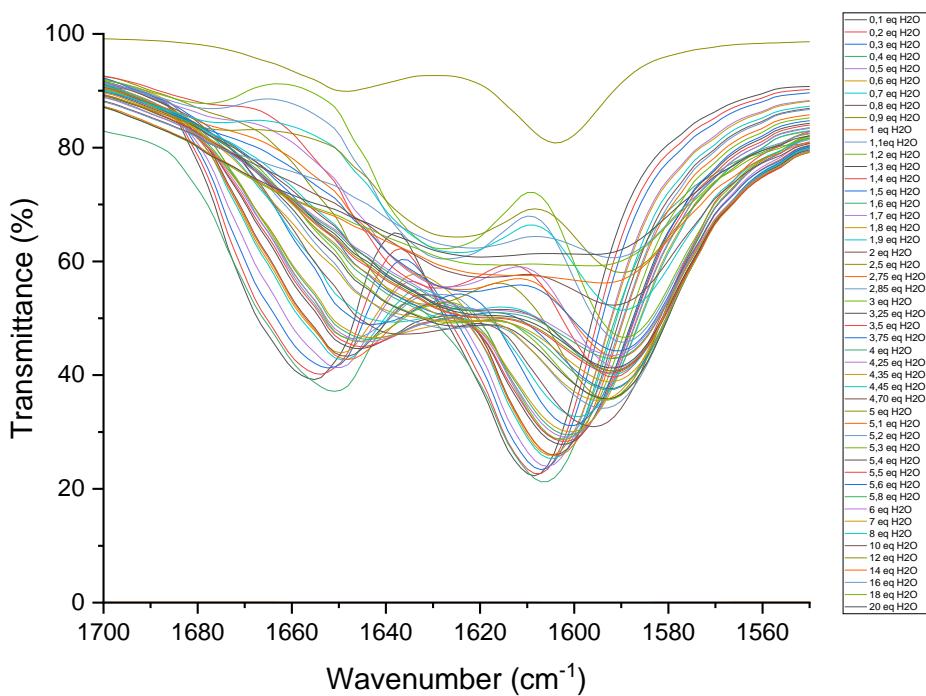

Figure S171 expansion of the mTBN imine region ($1400 - 1600 \text{ cm}^{-1}$)

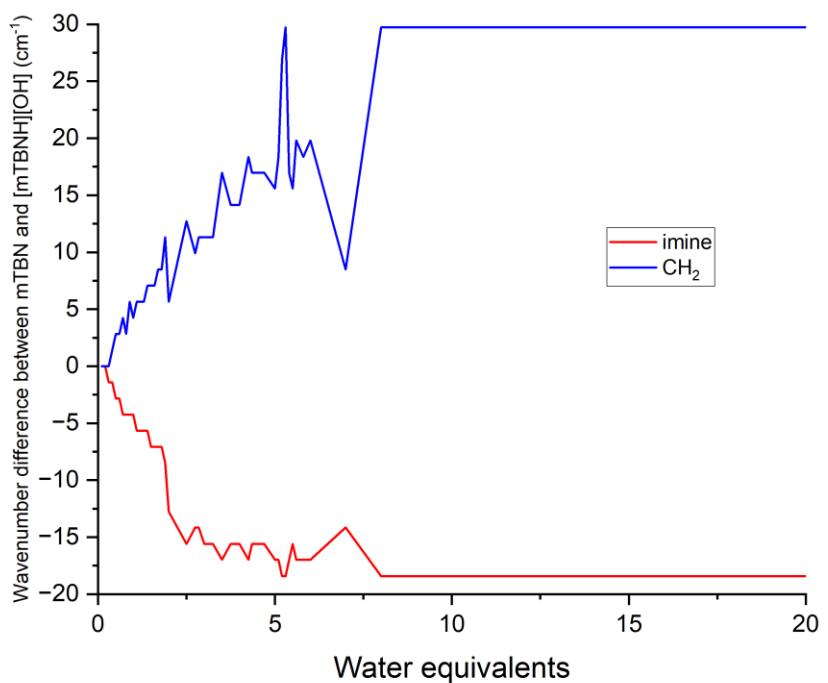

Figure S 172 IR shift of the imine and CH₂ IR signal of mTBN in function of the water equivalents.

c. dm3-mTBD

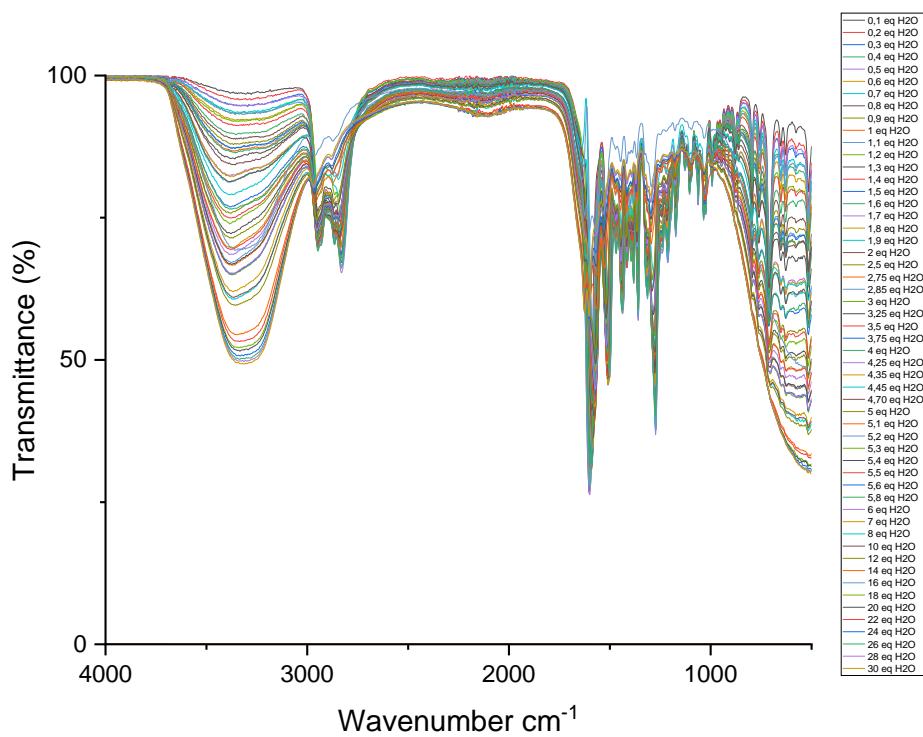

Figure S173 IR of water titration of dm3-mTBD.

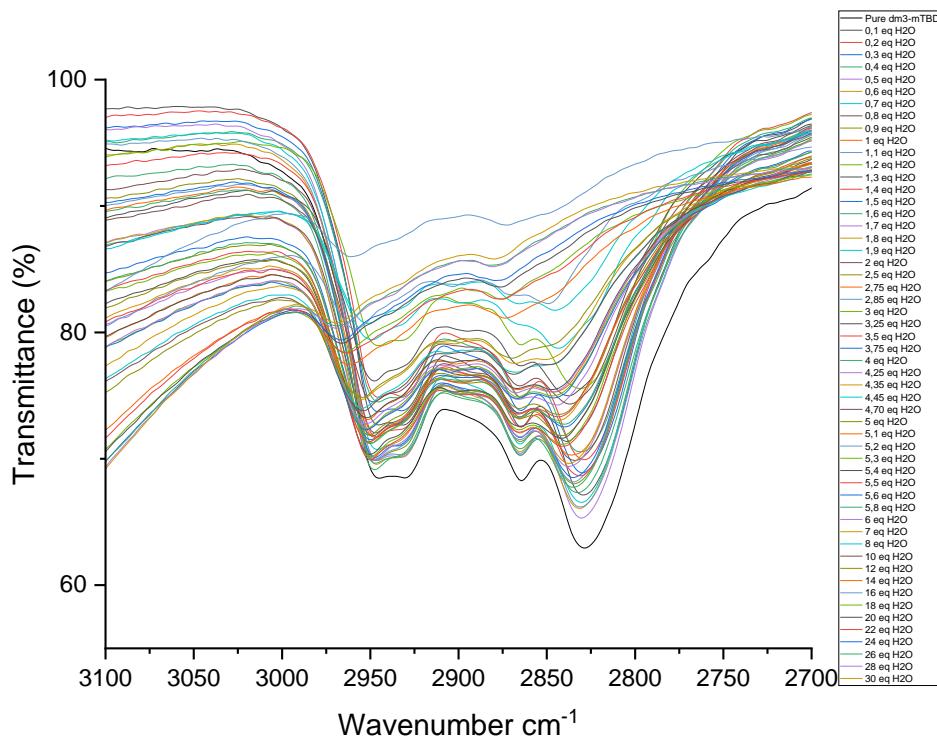

Figure S174 expansion of the dm3-mTBD CH₂ region (2800 – 3000 cm⁻¹)

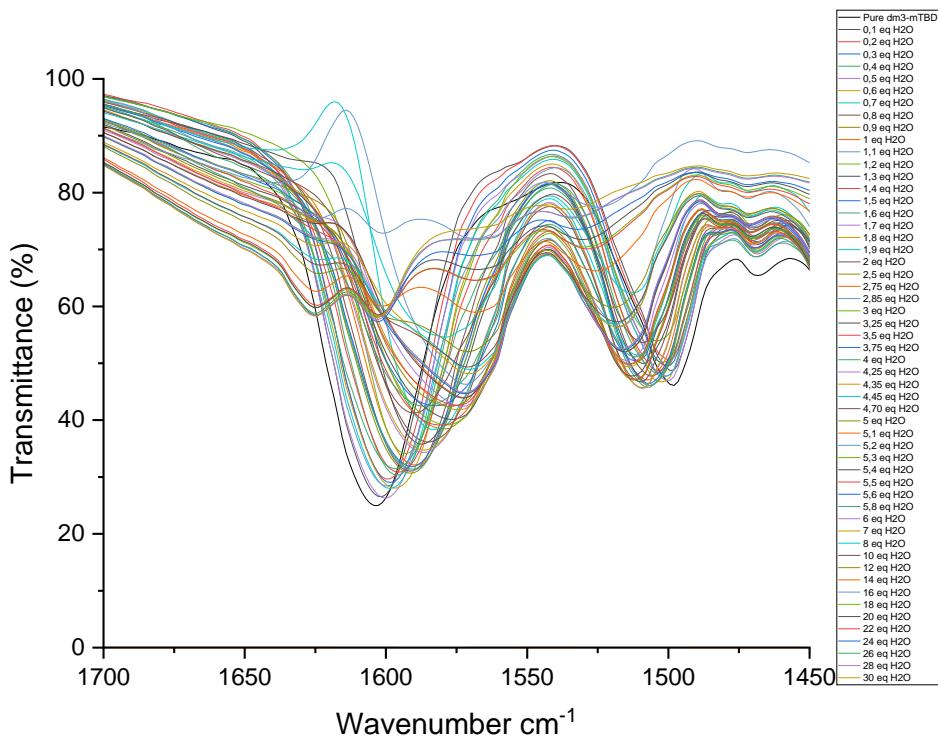

Figure S175 expansion of the dm3-mTBD imine region ($1400 - 1600 \text{ cm}^{-1}$)

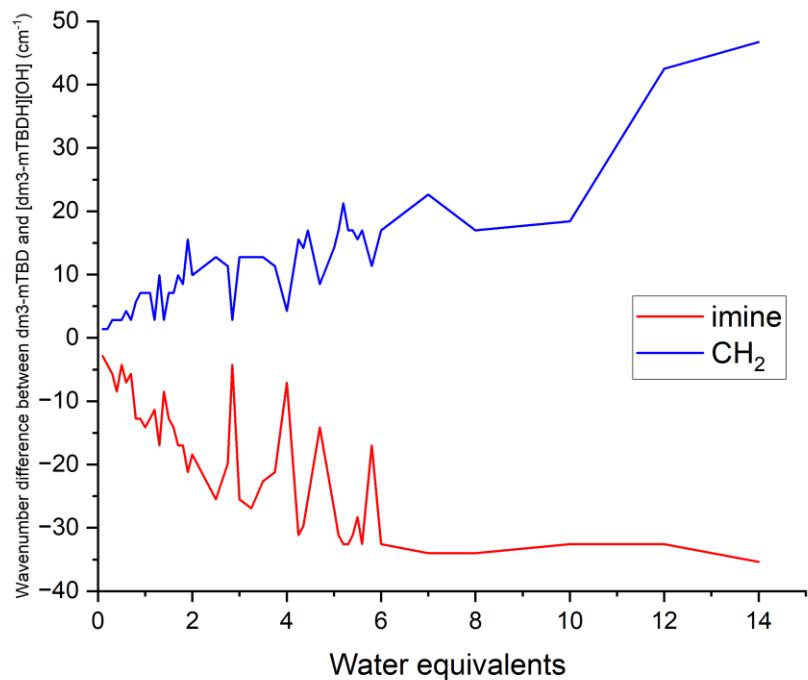

Figure S 176 IR shift of the imine and CH_2 IR signal of dm3-mTBD in function of the water equivalents.

d. *mTBO*

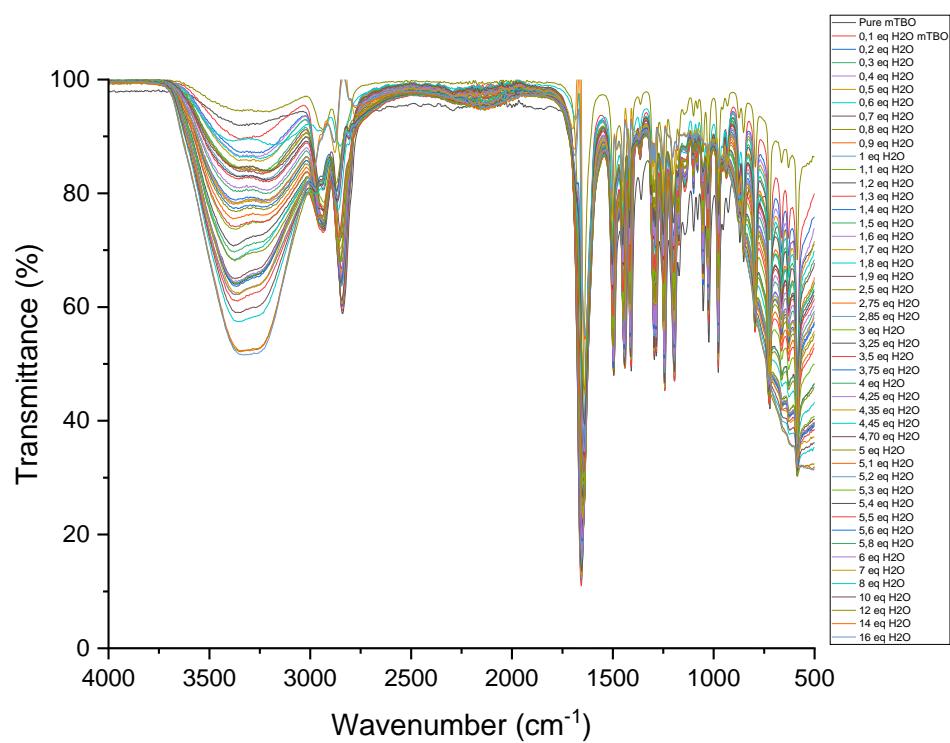

Figure S177 IR of water titration of *mTBO*.

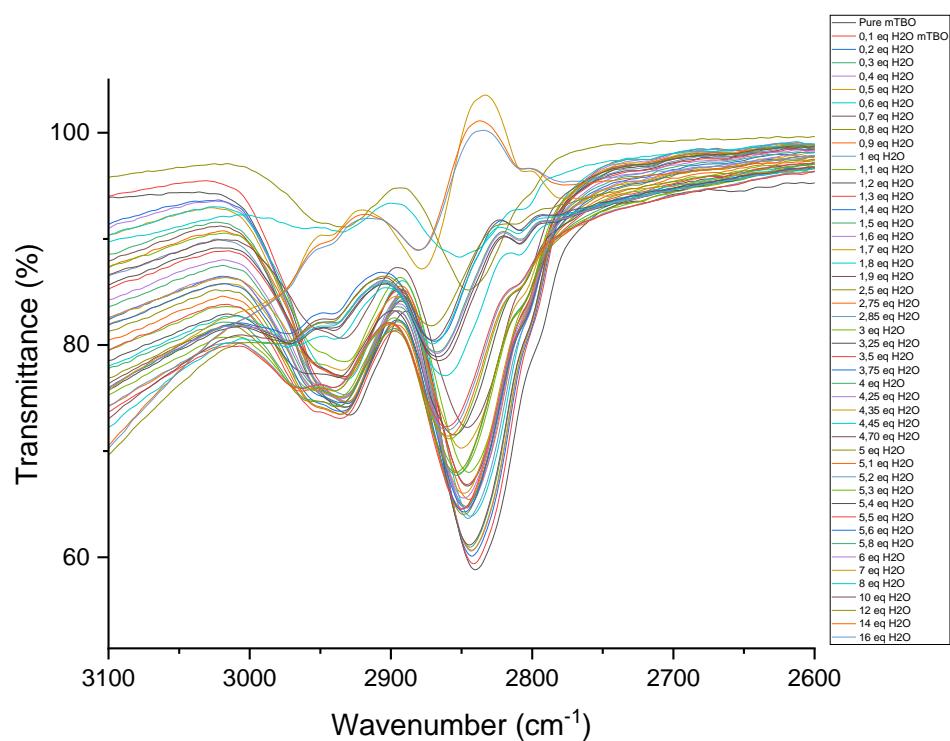

Figure S178 expansion of the *mTBO* CH_2 region ($2800 - 3000 \text{ cm}^{-1}$)

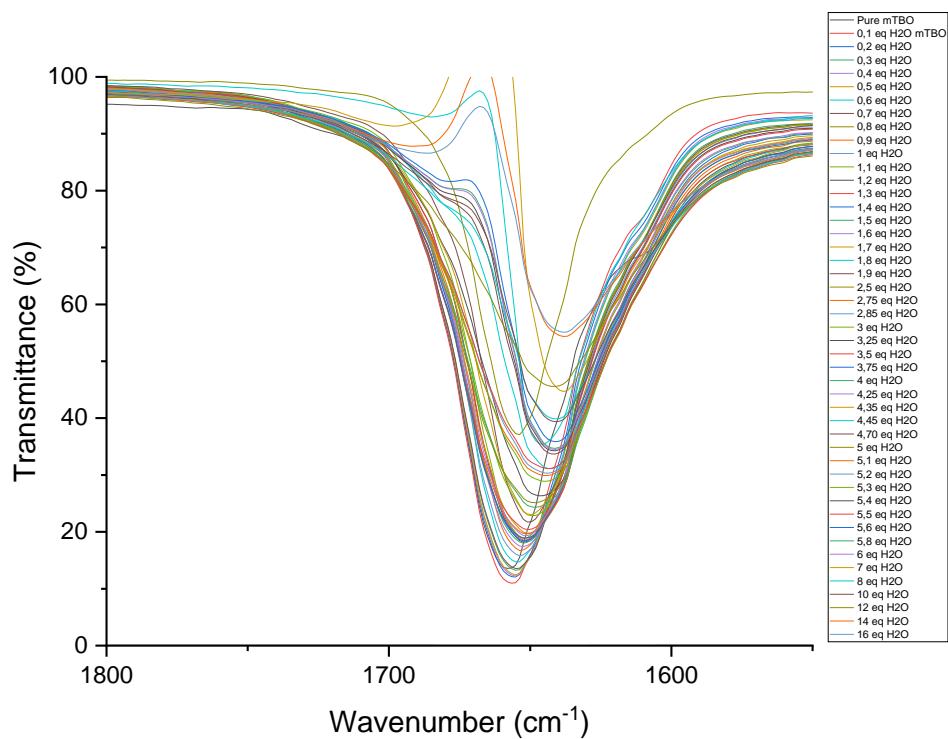

Figure S179 expansion of the dm3-mTBD imine region (1400 – 1600 cm^{-1})

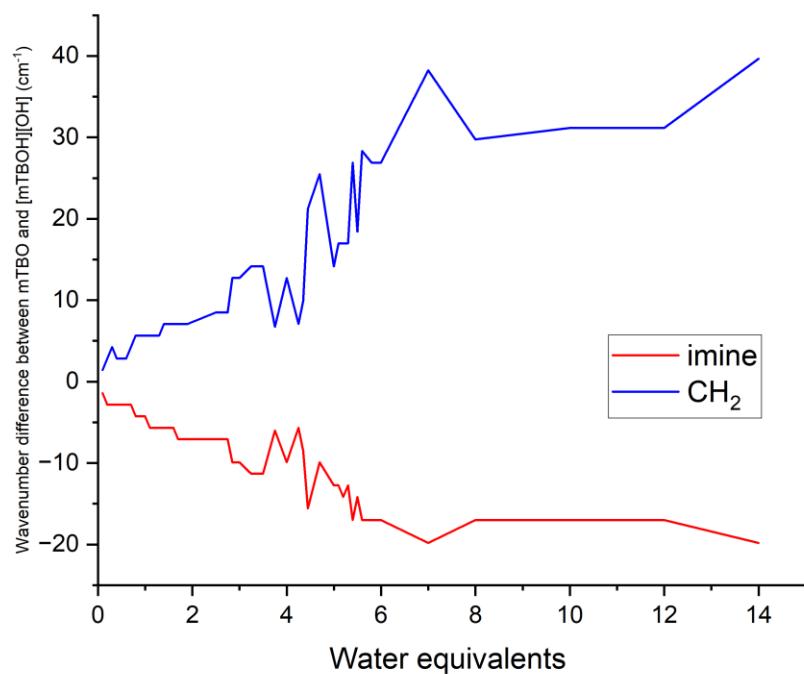

Figure S 180 IR shift of the imine and CH₂ IR signal of mTBO in function of the water equivalents.

VII. Prediction of reaction free energy barriers

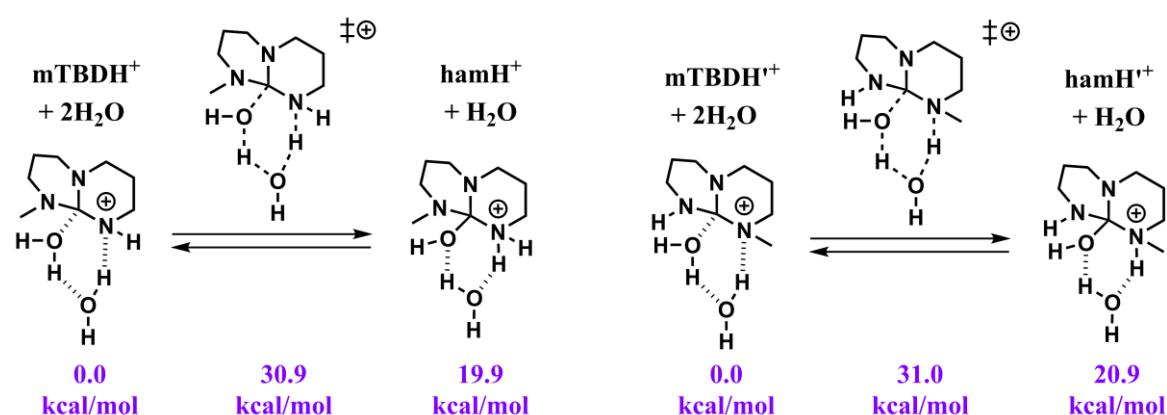

The Gibbs free energy barriers ($\Delta^{\ddagger}G$) of reaction steps involved in the hydrolysis of mTBD were estimated with quantum chemical methods.

Conformational isomers of reactants, transition states and products were initially searched with Spartan'20¹ using the Merck Molecular Force Field (MMFF) method². Next, the geometry of each conformer was optimized at the BP86/def-TZVP-COSMO³⁻⁶ level of theory, using TURBOMOLE v7.8^{7,8}, with subsequent frequency calculations done to ensure that the structures correspond to appropriate stationary points. Intrinsic Reaction Coordinate (IRC) calculations served to characterize the minima (reactants and products) connected to each transition state.

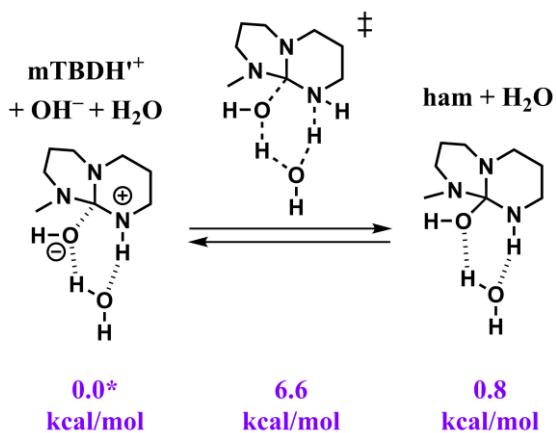

The optimized conformer sets produced this way were used as input to COSMOconf v'24⁹, using a custom job workflow, which included the following steps: 1) Single-point calculation at the BP86/def2-TZVPD-COSMO level of theory^{3-6,10} with a smooth-radii based isosurface cavity (FINE) parameterization; 2) Removal of duplicate conformers based on geometry similarity, using COSMOconf's CLUSTER_GEOCHECK algorithm; 3) Single-point calculation at the BP86/def2-TZVPD level of theory, but without COSMO.

Once the BP86/def2-TZVPD//BP86/def2-TZVP COSMO screening surface charge densities and gas-phase energies were obtained for each conformer set, the multi-conformer free energy of each species in pure water was obtained with the COnductor like Screening MOdel for Real Solvents (COSMO-RS)¹¹⁻¹³ implemented in COSMOtherm v'24¹⁴. The reference state used was 1 bar of ideal gas and 1 mol/L for the liquid solvent, and all calculations were done at 298 K.

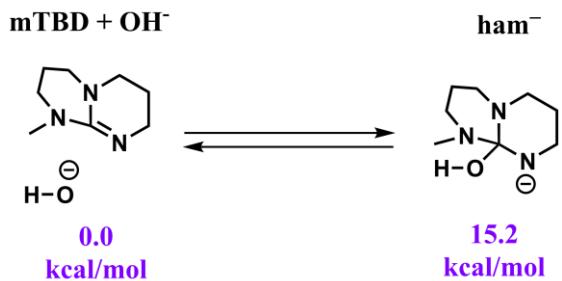

The modelled step-wise hydrolysis mechanism included the following reaction steps: Initial nucleophilic attack of water on the protonated mTBD, forming a protonated hemiaminal intermediate (hamH⁺), shown in Scheme 1; Initial nucleophilic attack of OH⁻ on the protonated mTBD, forming a neutral hemiaminal intermediate, shown in Scheme 2; Nucleophilic attack of OH⁻ on the neutral mTBD, forming an anionic intermediate, shown in Scheme 3; Nucleophilic attack of water on the protonated mTBD catalyzed by acetate, shown in Scheme 4; Hemiaminal zwitterion formation and subsequent deamination step, shown in Scheme 5; Concerted deamination catalyzed by acetate, shown in Scheme 6.

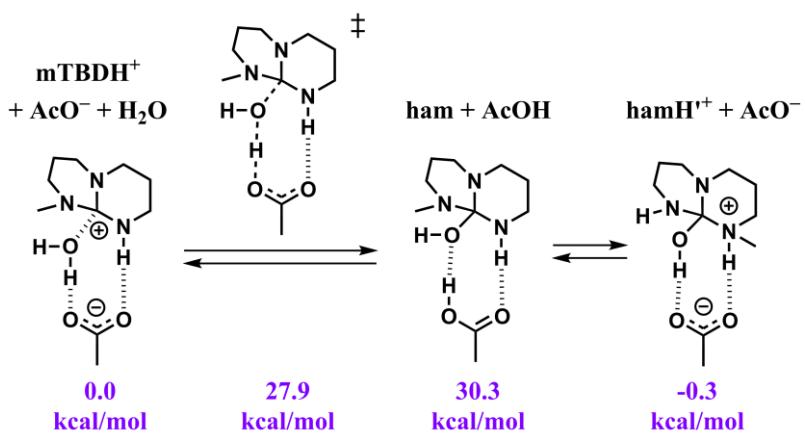

Scheme 1) Hemiaminal formation step: Water attack on protonated mTBD.

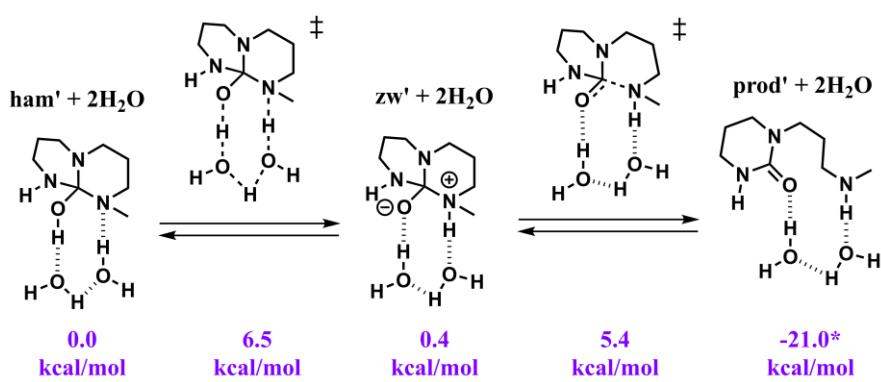

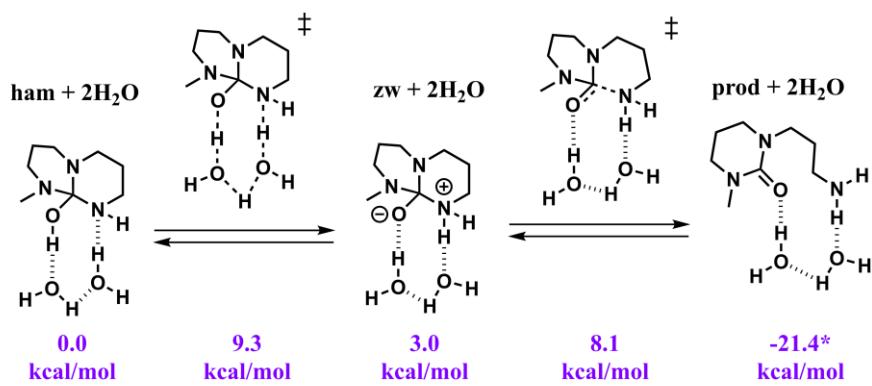

Scheme 2) Hemiaminal formation step: OH⁻ attack on protonated mTBD. *: reactant-side free energy calculated for the IRC end-point, without full geometry optimization.

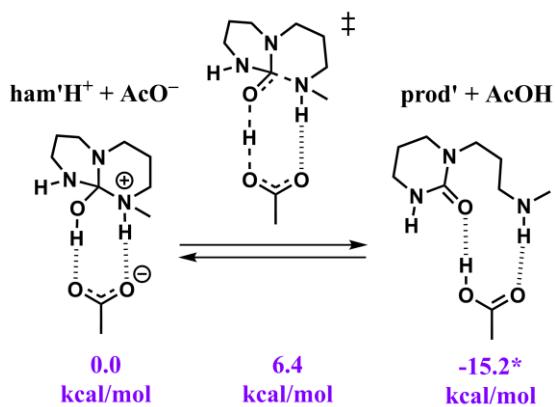

Scheme 3) OH⁻ attack on neutral mTBD. No transition state was found. Free energy of anionic product calculated relative to separate reactants (mTBD + OH⁻).

Scheme 4) Hemiaminal formation step: Water attack on protonated mTBD catalyzed by acetate.

Scheme 5) Hemiaminal zwitterion formation step followed by deamination reaction step. *: summed free energy of separate products (prod + 2H₂O).

Scheme 6) Concerted deamination reaction step catalyzed by acetate. *: summed free energy of separate products (prod' + AcOH).
