### **Methodology for isolating EVs from saliva provided by the supplier**

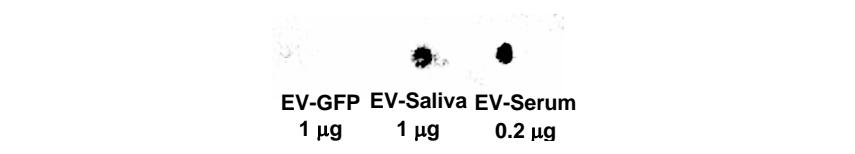

To isolate EVs from saliva (EV-Sal) using the ExoQuick® system, first, collect saliva samples and centrifuge them at 2,000 × g for 10 minutes at 4°C to remove cells and debris. Transfer the supernatant to a new tube and add ExoQuick solution at the manufacturer-recommended volume (typically a 1:5 ratio of ExoQuick to saliva). Mix the solution by inverting the tube several times and incubate it at 4°C for 30 minutes to allow EV precipitation. Next, centrifuge at 1,500 × g for 30 minutes at 4°C, carefully remove the supernatant, and resuspend the EV pellet in PBS or an appropriate buffer.
