General Information

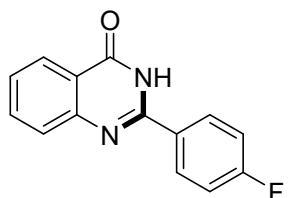

Commercially available reagents were purchased and used without further purification, unless otherwise stated. For the ultrasound irradiation, ultrasound apparatus from KQ3200DV ultrasonic cleaner with a frequency of 40 kHz and an output power of 150 W were used. The reactions were monitored by thin layer chromatography (TLC) on 0.25 mm silica gel plates (GF254) and visualized under UV light. Silica gel (200-300 mesh) was used for flash column chromatography. Nuclear magnetic resonance spectra (¹H NMR and ¹³C NMR) were recorded on a Bruker Avance 400 spectrometer at 400 MHz and 100 MHz in DMSO-*d*₆, and chemical shifts were reported as parts per million (ppm). The resonance patterns were annotated as s (singlet), d (doublet), t (triplet) and m (multiplet). The coupling constants (*J*) were reported in Hertz (Hz). HRMS data were recorded using an Agilent Accurate-Mass Q-TOF LC/MS 6520 instrument with an ESI source.

General procedure for synthesis of products 3

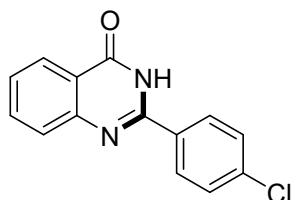

A mixture of *o*-aminobenzamides **1** (1.0 mmol) and aldehydes **2** (1.0 mmol) was prepared in a round bottom flask. The mixture was dissolved in CH₃OH (10 mL) and DDQ (1.2 mmol) was loaded into the round bottom flask. Afterwards, the reaction mixture was subjected to ultrasound irradiation at 60 W for 15 minutes at room temperature. After completion of the reaction, the organic solvent was evaporated. The obtained mixture was quenched by the aqueous sodium sulfite solution, extracted with ethyl acetate (25ml ×3). The combined organic layer was dried with anhydrous MgSO₄, and then remove the solvent. The crude product was purified by silica gel column chromatography to give the desired product **3**.

2-Phenylquinazolin-4(3H)-one (3aa).
