1 General Information:

All chemicals were obtained from commercial sources and were used as received unless otherwise noted. All air- and moisture-sensitive manipulations were carried out with standard Schlenk techniques under nitrogen or in a glove box under argon. The ^1H NMR spectra were recorded on 600 MHz NMR spectrometer. The ^{13}C NMR spectra were recorded at or 150 MHz. The ^{31}P NMR spectra were recorded at 243 MHz. The ^{11}B NMR spectra were recorded at 193 MHz. Chemical shifts were expressed in parts per million (δ) downfield from the internal standard tetramethylsilane (TMS), and were reported as s (singlet), d (doublet), t (triplet), dd (doublets of doublet), dt (doublets of triplet), and m (multiplet). The residual solvent signals were used as references and the chemical shifts were converted to the TMS scale (CDCl_3 : $\delta \text{ H} = 7.26 \text{ ppm}$, $\delta \text{ C} = 77.16 \text{ ppm}$). The coupling constants J were given in Hz. High resolution mass spectra (HRMS) were obtained via ESI mode by using a MicroTOF mass spectrometer. Absorption data were recorded on a SHIMADZU UV-3600 spectrophotometer. Fluorescence and quantum yield data were recorded on a PerkinElmer LS45 fluorescence spectrometer. Column chromatography was performed on silica gel (200-300 mesh) with freshly distilled ethyl acetate and petroleum ether or dichloromethane and methanol.

The *N*-pyrimidylindoles¹, 2-pyridones² and dialkynylphosphine oxides³ were synthesized according to reported procedures.
