Catalyst synthesis

Commercial SiO₂ (Davisil, grade 646, Sigma-Aldrich) was calcined in flowing air at 500°C for 8 h prior to use as a support for catalyst preparation. The calcined support (specific surface area was 304 m²·g⁻¹) was modified with phosphorous by incipient wetness impregnation with an aqueous solution of NH₄H₂PO₄ (99%, Merck) in the concentration required to achieve an atomic surface density of P of 1.5 atoms·nm⁻². The support precursor was dried at 110°C overnight and finally calcined at 500°C in flowing air for 4 h (heating rate was 5 K·min⁻¹). The promoted support material is denoted as P/SiO₂.

Incipient wetness impregnation was also applied to deposit molybdenum on the P/SiO₂ support using an aqueous solution of (NH₄)₆Mo₇O₂₄·4H₂O (99%, Alfa Aesar). The impregnated solid material was dried at 110°C overnight and finally calcined at 500°C in flowing air for 8 h (heating rate was 5 K·min⁻¹). For Mo, a nominal surface density of 1.5 atoms·nm⁻² was chosen, which corresponds to about 7.3 wt % of Mo. The catalyst is abbreviated as Mo/P/SiO₂.

Catalyst characterization

UV-vis measurements were carried out using an Avantes spectrometer (AvaSpec-2048-USB2-RM) equipped with a high-temperature reflection UV-vis probe, an Ava-Light-DH-S-BAL deuterium-halogen light source and a CCD array detector. The samples were *in situ* calcined at 500°C in flowing air (15 mL·min⁻¹) for 1 h and cooled down to 50°C in the same flow. The UV-vis spectra were recorded at 50°C in the 200–800 nm range. BaSO₄ was used as a white standard for the calculation of the Kubelka-Munk function.

The *in situ* Raman spectra of the samples were collected on a Renishaw inVia Raman Microscope equipped with a reaction cell (Linkam) using a 442 nm laser and an X20 objective. Before collecting the spectra at 50°C, the samples were heated up to 500°C in He flow (10 mL·min⁻¹) at a heating rate of 10 K·min⁻¹. Hereafter, they were treated at 500°C in air flow (10 mL·min⁻¹) for 1 h and cooled down to 50°C in He flow (10 mL·min⁻¹).

In situ diffuse reflectance infrared Fourier transform spectroscopy (DRIFTS) measurements were performed using a Thermo Scientific Nicolet iS10 spectrometer equipped with a Harrick Praying Mantis and a high-temperature reaction chamber. Prior to collecting the spectra, each sample (SiO₂, Mo/SiO₂, P/SiO₂, and Mo/P/SiO₂) was heated in an N₂ flow (10 mL·min⁻¹, heating rate 10 K·min⁻¹) from room temperature to 450 °C, then calcined in an air flow (12 mL·min⁻¹) at 450 °C for 1 h and cooled down in an N₂ flow to 50 °C. The spectra were collected with a resolution of 4 cm⁻¹ and an accumulation of 64 scans in the range of 400–4000 cm⁻¹ under flowing N₂ (10 mL·min⁻¹).

XPS analysis was performed for Mo/P/SiO₂ sample with a ESCALAB220iXL (ThermoFisher Scientific) with monochromatic Al K α radiation (1486.6 eV). For charge compensation low-energetic electrons of 10 eV were used (flood gun). The electron binding energy was referenced to adventitious carbon at 284.8 eV according to the advice of NIST. The peaks were fitted after subtracting a Shirley background with Gaussian-Lorentzian curves.

Solid state ^{31}P magic angle spinning (MAS) NMR experiments were performed at a 9.4 T Bruker AVANCE III HD spectrometer operating at 400.5 MHz proton frequency. The Bruker Ascend DNP widebore magnet was equipped with a 4 mm MAS WVT H/X/Y probe which was configured in X/H double mode with inserted range coil to reach the frequency of ^{31}P (162.1 MHz). All experiments were performed at room temperature. The ^{31}P chemical shift was referenced to 85% H_3PO_4 at 0.0 ppm. $(\text{NH}_4)_2\text{HPO}_4$ was used as a secondary reference with its signal set to 1.33 ppm. For the detection of ^{31}P signals at a MAS frequency of 12 kHz, direct excitation and rotor synchronized Hahn-echo experiments were performed. T_1 time constants were obtained with a saturation recovery experiment with Hahn-echo detection. In case of Mo/P/SiO₂, the sample was diluted with adamantane in a weight ratio of 1:3 because the pure undiluted powder did not allow for stable MAS rotation. To this end, adamantane was ground in a mortar, sample was added, rapidly ground and mixed thoroughly.

Catalytic tests

Catalytic tests were performed at 1.25 bar (abs.) in an in-house developed set-up equipped with 14 parallel operating continuous-flow fixed-bed quartz reactors. The catalyst (100 mg, sieve fraction of 315–710 μm) was heated in flowing N_2 up to 500°C and calcined in air flow at 500°C for 3 h. Hereafter, it was cooled down in N_2 flow to 50°C and exposed to a flow (22 $\text{mL}\cdot\text{min}^{-1}$ per reactor) of $\text{C}_2\text{H}_4/\text{trans-2-C}_4\text{H}_8/\text{N}_2=5/5/1$. To investigate the effect of catalyst treatment with individual olefins on propene production, the same catalyst sample (unless otherwise specified) was regenerated in air flow at 500°C for 3 h, cooled down in N_2 flow to 50°C and treated in one of the following ways before performing the metathesis reaction: (i) exposed to a flow (22 $\text{mL}\cdot\text{min}^{-1}$ per reactor) of $\text{trans-2-C}_4\text{H}_8/\text{N}_2=5/6$ for 15 min, 1 h, 2 h, or 4 h; (ii) exposed to a flow of $\text{C}_2\text{H}_4/\text{N}_2=5/6$ for 4 h; (iii) exposed to a flow (22 $\text{mL}\cdot\text{min}^{-1}$ per reactor) of $\text{trans-2-C}_4\text{H}_8/\text{N}_2=5/6$ for 1 h, 2 h, or 4 h and then to a flow (22 $\text{mL}\cdot\text{min}^{-1}$ per reactor) of $\text{C}_2\text{H}_4/\text{N}_2=5/6$ for 1 h, 2 h, or 4 h.

The feed components and the reaction products were analyzed by an on-line gas chromatograph (Agilent 6890) equipped with AL/S capillary column (for hydrocarbons) connected to a flame ionization detector and PLOT/Q (for CO_2)/Molsieve 5 (for H_2 , O_2 , N_2 , and CO) capillary column combination connected to a thermal conductivity detector. To calculate the rate of formation of olefins ($r(\text{C}_n\text{H}_{2n})$), equation 1 was used. The rate was determined at a degree of ethylene conversion of less than 15%.

$$r(\text{C}_n\text{H}_{2n}) = \frac{F_{feed} \times \frac{x_{\text{N}_2}^{in}}{x_{\text{N}_2}^{out}} \times x^{out}(\text{C}_n\text{H}_{2n})}{V_m \times m_{cat}} \quad (1)$$

Here, F_{feed} is the volumetric flow rate of the feed gas ($\text{mL}\cdot\text{min}^{-1}$) under reference conditions (0°C, 1 atm), x_{N_2} with superscripts “in” or “out” stands for the molar fraction of N_2

at the reactor inlet or outlet, $x^{out}(C_nH_{2n})$ is the molar fraction of a certain olefin at the reactor outlet, V_m is the molar volume (22414 mL·mol⁻¹), and m_{cat} is catalyst weight (g).

Steady-state isotopic transient kinetic analysis

Steady-state isotopic transient kinetic analysis (SSITKA) experiments were performed in a tubular continuous-flow fixed-bed quartz reactor at 50°C using an in-house developed set-up. The catalyst (100 mg) was heated in Ar flow up to 500°C at a heating rate of 10 K·min⁻¹, calcined in air flow at 500°C for 1 h, and then cooled down to 50°C in Ar flow. Hereafter the catalyst was exposed to a flow of a mixture consisting of 1 vol% C₂H₄, 1 vol% trans-2-C₄H₈ and Ar (total flow was 5 mL·min⁻¹). After about 20 min on stream, this feed was switched to a feed with isotopic labelled ¹³C₂H₄ (1 vol% ¹³C₂H₄, 1 vol% trans-2-C₄H₈, 5 vol% He in Ar, total flow 5 mL·min⁻¹). The gas composition at the reactor outlet was monitored by an on-line mass spectrometer (Pfeiffer Vacuum Omni Star) and an on-line gas chromatograph (Agilent 7890A). Hereafter, the catalyst sample was regenerated in air flow at 500°C for 1 h and cooled down to 50°C in Ar flow. Then, the sample was treated in trans-2-C₄H₈ flow (trans-2-C₄H₈/Ar=10/12, total flow 22 mL·min⁻¹) for 4 h and then in C₂H₄ flow (C₂H₄/Ar=10/12, total flow 22 mL·min⁻¹) for 4 h. The treated sample was exposed to the non-labelled reaction feed and to the labelled one according to the procedure described above for the fresh sample.

Reaction kinetic modeling

The following set of equations were used for kinetic modelling of the metathesis reaction:

$$\frac{\partial C_i}{\partial t} = -f \frac{\partial C_i}{\partial x} + R_i \quad (2)$$

$$\frac{\partial \theta_i}{\partial t} = \frac{R_i}{N_0} \quad (3)$$

$$R_i = \rho_{cat} \sum_j \nu_j^i r_j \quad (4)$$

$$r_i = k_i N_0 \left(\prod_j p_j^{n_j^+} \prod_j \theta_j^{m_j^+} - \frac{1}{K_i} \prod_j p_j^{n_j^-} \prod_j \theta_j^{m_j^-} \right) \quad (5)$$

$$\sum_i \theta_i = 1 \quad (6)$$

where C_i – the concentration of i-component in the gas phase ($\text{mol} \cdot \text{cm}^{-3}$); θ_i – the coverage of surface i-intermediate (dimensionless); f – the linear velocity ($\text{cm} \cdot \text{s}^{-1}$); t – time (s); x – the coordinate along the catalyst bed (cm); r_j – the rate of j-reaction ($\text{mol} \cdot \text{g}^{-1} \cdot \text{s}^{-1}$); ρ_{cat} – catalyst density ($\text{g} \cdot \text{cm}^{-3}$); p_j – the pressure of i-component in the gas phase (bar); n_j^+ , m_j^+ , n_j^- , and m_j^- – the reaction orders with respect to the feed components and the reaction products, ν_j^i – the stoichiometric coefficient of i-compound for the j-reaction (negative for reagents and positive for products); k_i – the rate constant of i-reaction; K_i – the equilibrium constant of i-reaction; N_0 – the total amount of active sites (mol g^{-1}).

The system of partial differential equations was transformed into the system of ordinary differential equations by the finite difference method.¹ The backward difference was used to approximate the derivative of x . To solve a stiff system of ordinary differential equations, the numerical Adams/BDF method with automatic stiffness detection and switching was used.² The

search for kinetic parameters (rate and equilibrium constants) was carried out by minimizing the following loss function:

$$\frac{1}{n} \sum_{i=1}^n (C_i^{exp} - C_i^{pred})^2 \quad (7)$$

where C_i^{exp} – the experimental value of the concentration, C_i^{pred} – the calculated value of the concentration, n – the number of experimental points.

The kinetic parameter sensitivity analysis was performed to identify the significance of parameters applied in the kinetic model. For this, we varied the value of a selected kinetic parameter (while keeping the other parameters constant) to find an interval where the loss function increased by up to 10%. The same procedure was performed for all the parameters of the model. The absence of external heat transfer, external and internal diffusion limitations, the wall effect, and axial dispersion was checked by applying Mears and Weisz-Prater criteria (see supporting information).^{3,4}

The Nelder-Mead algorithm was used to minimize the loss function.⁵ The Python programming language⁶ (version 3.10) and its scientific libraries SciPy⁷, NumPy⁸ and LMFIT⁹ were used for calculations.

For the kinetic modeling the following assumptions were made:

1. The total concentration of active sites N_0 that can be transformed into carbene species from olefins was assumed to be 10^{-6} mol g⁻¹. This value is slightly higher than the number of carbene species determined in the SSITKA experiment (Table S1), since SSITKA shows only the active sites participating into propene formation and does not take into account the sites transformed into “inactive” complex.
2. There are two types of MoO_x species (Mo* and Mo**) on the surface of the catalyst which differ in their ability (fast Mo* or slow Mo**) to form active carbenes through the

reaction with C₄ olefins. Although, there are several mechanisms proposed for carbene generation (pseudo-Wittig, allyl mechanism, 1,2-hydrogen shift mechanism, oxidative coupling, H-assisted mechanism) which imply the formation of carbenes with different composition (Mo=C_nH_{2n}, n = 1 – 4), we assume that catalyst activation leads to the formation of Mo=C₂H₄ carbenes. This assumption is reasonable because any of possible Mo=C_nH_{2n} carbenes can form Mo=C₂H₄ carbenes through the reaction with trans-2-C₄H₈, once this olefin is passed over the catalyst. Accordingly, the formation of Mo=C₂H₄ carbenes can include several steps. To simplify the kinetic model, we assumed that the first elementary step of the activation mechanisms is the rate-determining stage, and thus, the rate of the overall process can be presented as:

$$r_a \approx r_1 = k_1 \cdot N \cdot p_{olefin} \approx r_2 \approx r_3 \dots,$$

where r_a – the overall rate of the carbene formation, r_i – the rate for elementary step i ; k_1 – the constant rate; N – the concentration of MoO_x species (which are able to be transformed into carbenes) on the catalyst surface, p_{olefin} – partial pressure of olefin. Due to the low concentration of active sites, the formation of side products and the consumption of reagents during activation were neglected.

In the case of MoO_x species which are quickly transformed into active carbenes (Mo*), the proposed model includes an additional assumption. Instead of including additional elementary steps describing the formation of carbene species, it is assumed that the non-treated catalyst has already a certain amount of carbenes on the surface (θ_0 – the initial fraction of carbenes Mo=C₂H₄ that is an additional parameter of the kinetic model). As before, the formation of side products and the consumption of reagents during activation were neglected.

3. Because the partial pressure of olefins in the reaction feed is high, the decomposition of carbenes was not considered. All reactions and the values of kinetic parameters are presented in Tables S2 and S3.

Computational methods

A cluster model of *syn*-Mo(VI) ethylidene species on SiO₂ was obtained previously,¹⁰ based on the periodic model of the dioxo Mo(VI) species on amorphous silica.¹¹ The dangling bonds are saturated with hydrogens replacing the removed Si atoms to form hydroxyl groups at the cluster periphery. Structures of other Mo species were calculated during the investigation of the reaction pathways.

Geometry optimization was carried out using the B3PW91 hybrid functional¹² combined with the def2-SVP basis set.¹³ Vibrational frequencies were calculated in the harmonic oscillator approximation to confirm local minima or transition state structures, and to determine thermal corrections to the Gibbs energy. The rotational and translational contributions to the Gibbs energy are not included for the cluster models, only for gas-phase compounds. The transition states were additionally verified by the IRC method.¹⁴⁻¹⁶ Single-point energy calculations were performed for the optimized structures with the M06 hybrid functional¹⁷ and the def2-TZVPP basis set.¹³ The total Gibbs energy for each system is estimated as the sum of the M06 single point energy and the thermal correction, including the zero point energy. Reaction pathways are presented in terms of relative Gibbs energies at T = 323.15 K. All DFT calculations were done with the Gaussian 16 software.¹⁸

Diffusion and heat transfer limitations

External diffusion limitation is negligible if:

$$\frac{r_{obs} \cdot \rho_b \cdot R_{catalyst} \cdot n}{k_d \cdot C} < 0.15$$

Obtained value: $\approx 1.4 \cdot 10^{-3} < 0.15$

Internal diffusion limitation is negligible if:

$$\frac{r_{obs} \cdot \rho_p \cdot R_{catalyst}^2}{D_e \cdot C} < 1$$

Obtained value: $\approx 1.5 \cdot 10^{-2} < 1$

External heat transfer limitation is negligible if:

$$\frac{r_{obs} \cdot \rho_b \cdot R_{catalyst} \cdot E_a \cdot \Delta H}{k_g \cdot R \cdot T^2} < 0.15$$

Obtained value: $\approx 1.2 \cdot 10^{-4} < 0.15$

Axial dispersion is negligible if:

$$\frac{20 \cdot n \cdot d_{reactor}}{Pe_{ax} \cdot L_{bed}} < 1$$

Obtained value: $\approx 0.35 < 1$

The wall effect is negligible if:

$$\frac{d_{reactor}}{2 \cdot R_{catalyst}} > 10$$

Obtained value: $\approx 7.8 < 10$

Thus, there is a small wall effect. Nevertheless, since catalytic tests were performed with the same catalyst bed, the wall effect is equal for all measurements and was neglected.

The following equations and parameters values were used for estimation:

a. $Sh = \frac{2 \cdot k_d \cdot R_{catalyst}}{D} = 2 + 0.552 \cdot Re^{1/2} \cdot Sc^{1/3}$

b. $Re = \frac{2 \cdot u_{feed} \cdot R_{catalyst} \cdot \rho_{feed}}{\mu}$

c. $Sc = \frac{\mu}{\rho_{feed} \cdot D}$

d. $D_e = \frac{D \cdot \varepsilon \cdot \delta}{\tau}$

$$e. \quad \frac{1}{Pe_{ax}} = \frac{0.3}{Re \cdot Sc} + \frac{0.5}{1 + \frac{3.8}{Re \cdot Sc}}$$

The values of the parameters used for the validation of diffusion and heat transfer limitations are listed below.

	Parameter	Dimension	Value
r_{obs}	measured reaction rate	$\text{mol} \cdot \text{g}^{-1} \cdot \text{min}^{-1}$	$4 \cdot 10^{-4}$
ρ_b	bulk catalyst density	$\text{kg} \cdot \text{m}^{-3}$	468
ρ_p	particle density	$\text{kg} \cdot \text{m}^{-3}$	780
$R_{catalyst}$	catalyst particle radius	mm	0.256
n	reaction order	-	2
k_d	mass transfer coefficient ^a	$\text{m} \cdot \text{s}^{-1}$	0.053
C	bulk concentration of reactant	$\text{kmol} \cdot \text{m}^{-3}$	21.15
Sh	Sherwood number ^a	-	2.705
Re	Reynolds number ^b	-	2.5
Sc	Schmidt number ^c	-	0.53
D	diffusion coefficient	$\text{m}^2 \cdot \text{s}^{-1}$	10^{-5}
D_e	diffusion coefficient in porous ^d	$\text{m}^2 \cdot \text{s}^{-1}$	$1.06 \cdot 10^{-6}$
u_{feed}	gas feed velocity	$\text{m} \cdot \text{s}^{-1}$	0.0257
ρ_{feed}	gas feed density	$\text{kg} \cdot \text{m}^{-3}$	1.895
μ	dynamic viscosity	$\text{kg} \cdot \text{m}^{-1} \cdot \text{s}^{-1}$	10^{-5}
ε	porosity	-	0.4
δ	constrictivity	-	0.8
τ	tortuosity	-	3.0
E_a	activation energy	$\text{kJ} \cdot \text{mol}^{-1}$	100
ΔH	reaction heat	$\text{kJ} \cdot \text{mol}^{-1}$	25.65
k_g	heat transport coefficient	$\text{kJ} \cdot \text{m}^{-2} \cdot \text{s}^{-1} \cdot \text{K}^{-1}$	2.0
R	gas constant	$\text{J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$	8.314
T	temperature	K	323.15
$d_{reactor}$	reactor diameter	mm	4
L_{bed}	catalyst bed length	cm	1.7
Pe_{ax}	Peclet number ^e	-	2.81

Tables

Table S1 Rate of propene formation, surface residence time of intermediates, concentration of surface intermediates, turnover frequency, fraction of Mo transformed into carbenes with respect to the total amount of Mo in the sample. The samples are denoted as follows: Mo/P/SiO₂_cal – calcined Mo/P/SiO₂, Mo/P/SiO₂_C₄-C₂ – Mo/P/SiO₂ sequentially treated in 2-C₄H₈ at 50°C for 4 h and in C₂H₄ at 50°C for 4 h.

Sample	$r(\text{C}_3\text{H}_6)$, mol·g ⁻¹ ·s ⁻¹	τ_p , s	N_p , mol·g ⁻¹	TOF, s ⁻¹	Fraction of Mo [#] , %
Mo/P/SiO ₂ _cal	$7.3 \cdot 10^{-9}$	13.1	$9.6 \cdot 10^{-8}$	$7.6 \cdot 10^{-2}$	$1.3 \cdot 10^{-2}$
Mo/P/SiO ₂ _C ₄ -C ₂	$7.12 \cdot 10^{-8}$	9.8	$7.0 \cdot 10^{-7}$	$1.0 \cdot 10^{-1}$	$9.2 \cdot 10^{-2}$

[#] Fraction of Mo participating in carbene formation was calculated with respect to the total amount of Mo in the sample based on the assumption that one carbene site is formed from one Mo atom.

Table S2 Reactions considered for kinetic modeling.

#	reaction	kinetic expression
Carbene formation		
1.1	$\text{trans-2-C}_4\text{H}_8 + \text{Mo}^{**} \rightarrow \text{Mo}=\text{C}_2\text{H}_4 + \text{products}$	$k_{1.1} \cdot N_0 \cdot \theta \cdot p_{2-\text{C}_4\text{H}_8}$
1.2	$\text{1-C}_4\text{H}_8 + \text{Mo}^{**} \rightarrow \text{Mo}=\text{C}_2\text{H}_4 + \text{products}$	$k_{1.2} \cdot N_0 \cdot \theta \cdot p_{1-\text{C}_4\text{H}_8}$
Metathesis		
2.1	$\text{C}_2\text{H}_4 + \text{Mo}=\text{C}_2\text{H}_4 \rightarrow \text{Mo}=\text{CH}_2 + \text{C}_3\text{H}_6$	$k_{2.1} \cdot N_0 \cdot \theta_2 \cdot p_{\text{C}_2\text{H}_4}$
2.2	$\text{trans-2-C}_4\text{H}_8 + \text{Mo}=\text{CH}_2 \rightarrow \text{Mo}=\text{C}_2\text{H}_4 + \text{C}_3\text{H}_6$	$k_{2.2} \cdot N_0 \cdot \theta_1 \cdot p_{2-\text{C}_4\text{H}_8}$
2.3	$\text{1-C}_4\text{H}_8 + \text{Mo}=\text{C}_2\text{H}_4 \rightarrow \text{Mo}=\text{C}_3\text{H}_6 + \text{C}_3\text{H}_6$	$k_{2.3} \cdot N_0 \cdot \theta_2 \cdot p_{1-\text{C}_4\text{H}_8}$
2.4	$\text{trans-2-C}_4\text{H}_8 + \text{Mo}=\text{C}_3\text{H}_6 \rightarrow \text{Mo}=\text{C}_2\text{H}_4 + \text{C}_5\text{H}_{10}$	$k_{2.4} \cdot N_0 \cdot \theta_3 \cdot p_{2-\text{C}_4\text{H}_8}$
“Inactive” complex formation		
3	$\text{trans-2-C}_4\text{H}_8 + \text{Mo}=\text{C}_2\text{H}_4 \rightleftharpoons \text{Mo}=\text{C}_6\text{H}_{12}$	$k_3 \cdot N_0 \cdot (\theta_2 \cdot p_{2-\text{C}_4\text{H}_8} - 1/K_3 \cdot \theta_6)$

p_i – the partial pressure of the compound i. N_0 - the total concentration of active sites; θ - fraction of surface species with respect to the total amount of active sites. For each surface species, its fraction is provided below.

Surface species	Fraction [value at $t = 0$ s is shown in brackets*]
Mo^{**}	$\theta [1 - \theta_0]$
$\begin{array}{c} \text{CH}_2 \\ \\ \text{Mo} \end{array}$	$\theta_1 [0]$
$\begin{array}{c} \text{C}_2\text{H}_4 \\ \\ \text{Mo} \end{array}$	$\theta_2 [\theta_0]$
$\begin{array}{c} \text{C}_3\text{H}_6 \\ \\ \text{Mo} \end{array}$	$\theta_3 [0]$
	$\theta_6 [0]$

*initial condition for the integration of the system of differential equations.

Table S3 The values of the estimated parameters for the proposed kinetic model and their intervals based on parameter sensitivity analysis.

parameter	value	Interval	unit
θ_0	0.05	0 – 0.12	-
$k_{1,1}$	0.00046	0.00043-0.00054	$\text{bar}^{-1} \text{s}^{-1}$
$k_{1,2}$	0.017	0.014-0.020	$\text{bar}^{-1} \text{s}^{-1}$
$k_{2,1}$	67.9	65.7-69.8	$\text{bar}^{-1} \text{s}^{-1}$
$k_{2,2}$	15.0	13.6-16.2	$\text{bar}^{-1} \text{s}^{-1}$
$k_{2,3}$	2460	2310-2540	$\text{bar}^{-1} \text{s}^{-1}$
$k_{2,4}$	210	130-640	$\text{bar}^{-1} \text{s}^{-1}$
k_3	0.039	0.032-0.044	$\text{bar}^{-1} \text{s}^{-1}$
K_3	35.6	35.3-37.2	bar^{-1}

Table S4 The comparison of the values of the key kinetic parameters estimated by DFT and data-driven kinetic modelling.

	kinetic modelling	DFT
$k_{2,1}/k_{2,2}$	4.5	13
$k_{2,1}/k_3$	1750	$8.1 \cdot 10^3$
$k_{2,2}/k_3$	388	623
K_3	35.6	8.1

Figures

Figure S1 (a) UV-vis spectra and (b) the corresponding Tauc plots; (c) DRIFT spectra of support materials and the corresponding Mo-containing samples; (d) Raman spectra of dehydrated Mo/P/SiO₂ and reference Mo/SiO₂; (e) XPS of P 2p region of Mo/P/SiO₂; (f) ³¹P MAS-NMR of the rotating P/SiO₂ and Mo/P/SiO₂ diluted with adamantane. The spectra are normalized to the number of scans.

Figure S2 Temporal changes in the rates of formation of propene and pentenes during treatment of Mo/P/SiO₂ in (a) trans-2-C₄H₈ for 4 h at 50°C; (b) trans-2-C₄H₈ for 4 h at 50°C and then in C₂H₄ for 4 h at 50°C.

Figure S3 Temporal changes of the rate of propene formation determined over calcined Mo/SiO₂ (marked in black) and Mo/SiO₂ after treatment in trans-2-C₄H₈ for 4 h followed by treatment in C₂H₄ for 4h (marked in blue). Treatments and metathesis reaction were carried out at 50°C.

Figure S4 Temporal changes in the rate of propene formation over regenerated Mo/P/SiO₂ treated in trans-2-C₄H₈ at 50°C for 1 h and then in C₂H₄ for 30 min (dash lines indicate *in situ* treatment in C₂H₄ flow for 3 min after certain periods of time on stream). Unlike other experiments that used the same catalyst sample after regeneration, this experiment was performed with another catalyst sample, so its metathesis performance is slightly different due to the inhomogeneity of the catalyst surface.

Figure S5 Gibbs energy profile (kJ mol⁻¹) at T = 323 K for a reaction between *syn*-Mo(VI) ethylidene species and ethylene.

Figure S6 Gibbs energy profile (kJ mol⁻¹) at T = 323 K for a reaction between Mo(VI) methylidene species and *trans*-2-butene.

Figure S7 Experimental data and fitting results ((a) and (c)) as well as time-on-stream changes of the fractions of surface species (Mo-carbenes and "inactive" complex) formed from MoO_x ((b) and (d)) during metathesis over $\text{Mo}/\text{P}/\text{SiO}_2$ treated in $\text{trans-2-C}_4\text{H}_8$ for 1 h ((a), (b)) and treated in $\text{trans-2-C}_4\text{H}_8$ for 1 h and then in C_2H_4 for 2 h ((c), (d)). The changes of the fractions of surface species also include the data obtained for catalyst pre-treatment. Fraction of surface species is determined with respect to the total amount of activated MoO_x .

Figure S8 Prediction for temporal change of (a) propene molar fraction and (b) the fractions of surface species (Mo-carbenes and “inactive” complex); (c) experimentally obtained temporal changes in the rate of propene formation over calcined Mo/P/SiO₂. The reaction mixture C₂H₄/trans-2-C₄H₈/Ar=10/10/2 was applied for the first 6.3 h on stream, then the mixture was changed to C₂H₄/trans-2-C₄H₈/Ar=13.3/6.7/2 (next 2 h on stream), and again to C₂H₄/trans-2-C₄H₈/Ar=10/10/2. Total flow and the reaction temperature were 22 mL·min⁻¹ and 50°C respectively. Fraction of surface species is determined with respect to the total amount of activated MoO_x.

Due to the technical restrictions, catalytic data shown in Figure S8 (c) were obtained in a SSITKA setup, which differs from the setup (BERTA) applied for all other catalytic experiments. Moreover, different catalyst sample was used. Accordingly, the model prediction (Figure S8 (a) and (b)) obtained on the basis of the BERTA experimental data might not perfectly fit the data obtained in SSITKA setup. Nevertheless, it demonstrates the same tendency when C₂H₄/trans-2-C₄H₈ ratio was changed.

Cartesian coordinates (Å) of the structures
