Experimental sections

The several solvents and solutes used in this work were commercial materials, included ethylene carbonate (EC), fluoroethylene carbonate (FEC), propylene carbonate (PC), dimethyl carbonate (DMC), methyl ethyl carbonate (EMC) and LiPF_6 . The electrolytes with different proportions were prepared in an argon-filled glovebox (H_2O & O_2 contents < 1 ppm). EC: DMC: EMC / FEC: DMC: EMC / PC: DMC: EMC were mixing with volume ratio=1:1:1, LiPF_6 was selected as solute. The electrolytes were named EC-based, FEC-based, and PC-based, respectively. The electrolytes and their conductivity are shown in Figure S2&S3.

The measurements of the conductivity of the electrolytes were performed on DDS-307A conductivity meters with a titanium alloy electrode ($K = 0.01$). The linear sweep voltammetry (LSV) measurements were conducted on Solartron electrochemical station. The chemical compositions of CEI films were acquired from FTIR spectra (Bruker ALPHA). The surface morphology of LiCoO_2 was characterized by both Scanning Electron Microscopy (SEM Quanta 250, FEI) and Transmission Electron Microscopy (TEM, JEM2100, JEOL). The chemical compositions of the cathode interfacial layer were analyzed by XPS (AXIS Ultra, Kratos) with $\text{Al K}\alpha$ line as an X-ray source. Binding energies were calibrated by using the carbon content ($\text{C}1s = 284.8$ eV). The chemical compositions of the cathode interfacial layer were analyzed by TOF-SIMS (TOF SIMS ION-TOF GmbH) with a mass resolution of over 5000. The mass spectrometry was equipped with a 30 kV Bi^+ analysis beam for depth profiling or high-resolution mapping analysis in high current mode or burst alignment mode. Depending on the secondary ion polarity, a 500 eV Cs^+ ion beam or a 1 keV O^{2+} ion beam was applied for the negative mode. The sputtering and analysis areas are $100 \times 100 \mu\text{m}^2$.

The electrochemical performance was achieved on the Land CT2001A multichannel battery cycler equipment by assembling CR2032 coin cell of LiCoO_2/Li . Li foils were used as the negative electrodes. The cathode electrode was prepared by a homogenous slurry which was consisted of 80 wt.% active cathode materials, 10 wt.% super P and 10 wt.% polyvinylidene fluoride (PVDF) binder, dispersing the solid powders in N-methyl pyrrolidone (NMP) solvent. After stirring for 5h, the as-prepared slurry was coated on aluminum (Al) foil. The electrode was dried at 120°C under vacuum and punched into circular discs with a diameter of 14 mm. The thickness of the Li foil was 200 μm ,

and the amount of the electrolyte used in the coin cell was 70 μ L.

Simulation Method

DFT calculations are carried out using the Damping Function in Dispersion Corrected¹ density functional theory (DFT) method as implemented in the Gaussian 16 suite of programs (Gaussian 16, Revision B.01, Frisch, M.J., Trucks, G.W., Schlegel, H.B., Scuseria, G.E., Robb, M.A., Cheeseman, J.R.; Scalmani, G.; Barone, V.; Petersson, G.A.; Nakatsuji, H.; Li, X.; Caricato, M.; Marenich, A.V.; Bloino, J., Janesko, B.G., Gomperts, R., Mennucci, B., Hratchian, H.P., Ortiz, J.V., Izmaylov, A.F., Sonnenberg, J.L., Williams-Young, D., Ding, F., Lipparini, F., Egidi, F., Goings, J., Peng, B., Petrone, A., Henderson, T., Ranasinghe, D., Zakrzewski, V.G., Gao, J., Rega, N., Zheng, G., Liang, W., Hada, M., Ehara, M., Toyota, K., Fukuda, R., Hasegawa, J., Ishida, M., Nakajima, T., Honda, Y., Kitao, O., Nakai, H., Vreven, T., Throssell, K., Montgomery Jr., J.A., Peralta, J.E., Ogliaro, F., Bearpark, M.J., Heyd, J.J., Brothers, E.N., Kudin, K.N., Staroverov, V.N., Keith, T.A., Kobayashi, R., Normand, J., Raghavachari, K., Rendell, A.P., Burant, J.C., Iyengar, S.S., Tomasi, J., Cossi, M., Millam, J.M., Klene, M., Adamo, C., Cammi, R., Ochterski, J.W., Martin, R.L., Morokuma, K., Farkas, O., Foresman, J.B., Fox, D.J. Gaussian, Inc., Wallingford CT (2016)) with the basis sets 6-311G+(d,p).^{2, 3} For each transition state, intrinsic reaction coordinate (IRC) calculation is performed in both directions to connect these corresponding intermediates at the above level.
