Table S7. Selected bond lengths, angles and hydrogen bond parameters in the crystal structure of $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7)	32
Figure S21. (a) Supramolecular dimers formed through <i>R</i> 2210 hydrogen bonded motif. Crystal packing in $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7) viewed down the: (b) <i>a</i> -axis; (c) <i>b</i> -axis, and (d) <i>c</i> -axis. Non-coordinated methanol molecules are presented in the spacefill style. Hydrogen bonds are highlightes as yellow dashed lines.	34
Figure S22. Temperature-dependent diffraction patterns of $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (1).....	35
Figure S23. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$ (2)	35
Figure S24. Temperature-dependent diffraction patterns of $[\text{VO}_2(\text{HL}^2)]$ (4).....	36
Figure S25. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^3)(\text{OEt})(\text{H}_2\text{O})]$ (5)	36
Figure S26. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7)	37
Figure S27. Temperature dependence of refined molar volume of the $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (1) compound, which is calculated as $18V_{\text{cell}}$. Vertical bars represent standard uncertainty. Due to poor crystallinity of the compound, and consequently low diffraction data quality, the molar volume could not be refined precisely, but the overall change across the whole temperature range is insignificant - around 2%. However, above 160 °C the sample converts to another phase with similar unit cell parameters.....	37
Figure S28. (Top) Temperature dependence of refined molar volume of the $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$ (2) compound, which is calculated as $14V_{\text{cell}}$ below 160 °C, and $18V_{\text{cell}}$ above it. Standard uncertainties are very low, and not visible in the graph. At low temperatures the molar volume corresponds to the $\text{VO}(\text{L})$ moiety ligated with methoxy/methanol ligands. Above 110 °C the change in molar volume corresponds to the loss of two methanol molecules per moiety (ca. 100 \AA^3 as calculated from methanol crystal structure). (Bottom) Above 160 °C sample probably converts to $[\text{VO}_2(\text{HL}^1)]$, the same phase observed in high temperature PXRD patterns of $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (1).	38
Figure S29. Temperature dependence of refined molar volume of the $[\text{VO}_2(\text{HL}^2)]$ (4) compound, which is calculated as $14V_{\text{cell}}$. Vertical bars represent standard uncertainty. Molar volume increases smoothly across the whole temperature range, and the overall change across the whole temperature range is insignificant - around 4%. Partial amorphization begins at around 180 °C, as evidenced by high uncertainty of molar volume at those temperatures.....	39
Figure S30. Temperature dependence of refined molar volume of the $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7) compound, which is calculated as $14V_{\text{cell}}$. Vertical bars represent standard uncertainty. At low temperatures the molar volume corresponds to the $\text{VO}(\text{L})$ moiety ligated with methoxy/methanol ligands. Above 60 °C the change in molar volume corresponds to loss of one methanol molecule per moiety (ca. 50 \AA^3 as calculated from methanol crystal structure). Above 120 °C partial amorphization of the sample prevents precise refinements of molar volume	40

Figure S31. Examples of le Bail refinement on temperature-dependent PXRD data of [VO(L ¹)(OMe)(MeOH)] (2), at (a) 30 °C using unit cell parameters of [VO(L ¹)(OMe)(MeOH)], (b) 140 °C, unit cell parameters of intermediate phase: $a = 13.310(3)$ Å, $b = 9.9181(17)$ Å, $c = 8.6416(14)$ Å, $\alpha = 100.751(18)^\circ$, $\beta = 108.367(10)^\circ$, $\gamma = 101.710(17)^\circ$, (c) 200 °C, unit cell parameters of [VO ₂ (HL ¹)], $a = 15.2143(15)$ Å, $b = 12.8189(13)$ Å, $c = 9.7818(11)$ Å, $\alpha = 107.074(10)^\circ$, $\beta = 93.985(11)^\circ$, $\gamma = 93.584(9)^\circ$. The refinement results for (c) are similar to high temperature phase of (NH ₄)[VO ₂ (L ¹)] results.....	41
Figure S32. Example of le Bail refinement on temperature-dependent PXRD data of [VO ₂ (HL ²)] (4), at 30 °C using unit cell parameters of [VO ₂ (HL ²)] (4).	42
Figure S33. Example of le Bail refinement on temperature-dependent PXRD data of [VO(L ³)(OEt)(H ₂ O)] (5), at 30 °C using cell parameters of [VO(L ³)(OEt)(H ₂ O)] (5).	42
Figure S34. Examples of le Bail refinement on temperature-dependent PXRD data of [VO(L ³)(OMe)(MeOH)] (7), at (a) 30 °C using unit cell parameters of [VO(L ³)(OMe)(MeOH)] (7), (b) 100 °C, unit cell parameters of high-temperature phase: $a = 14.532(3)$ Å, $b = 12.726(3)$ Å, $c = 7.0829(10)$ Å, $\alpha = \gamma = 90^\circ$, $\beta = 92.019(9)^\circ$	43
Table S8. Tabulated weighted residual (R_{wp}) and unit cell parameters refined by le Bail fit from temperature-dependent PXRD data.....	44
Fig S35. Complex impedance spectra for complex 1 at various temperatures in heating/cooling run. The colored open circles denote experimental values, whereas the solid red line corresponds to the best fit. The corresponding equivalent circuit model is composed of parallel combinations of the resistor (R) and the constant-phase element (CPE), used for fitting the data of individual spectra....	47
Fig S36. Complex impedance spectra for complex 4 (a,b) and complex 6 (c), at various temperatures in heating/cooling run. The colored open circles denote experimental values, whereas the solid red line corresponds to the best fit. The corresponding equivalent circuit model is composed of parallel combinations of the resistor (R) and the constant-phase element (CPE), used for fitting the data of individual spectra.....	47
Figure S37. Conductivity spectra for mononuclear VO(L ¹)(OMe)(MeOH)] sample (complex 2) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).....	48
Figure S38. Conductivity spectra for mononuclear [VO ₂ (HL ²)] sample (complex 4) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).	48
Figure S39. Conductivity spectra for mononuclear [VO(L ³)(OMe)(MeOH)] sample (complex 7) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).....	48

Figure S21. (a) Supramolecular dimers formed through $R_2^2(10)$ hydrogen bonded motif. Crystal packing in $[VO(L^3)(OMe)(MeOH)]$ (7) viewed down the: (b) a -axis; (c) b -axis, and (d) c -axis. Non-coordinated methanol molecules are presented in the spacefill style. Hydrogen bonds are highlighted as yellow dashed lines.

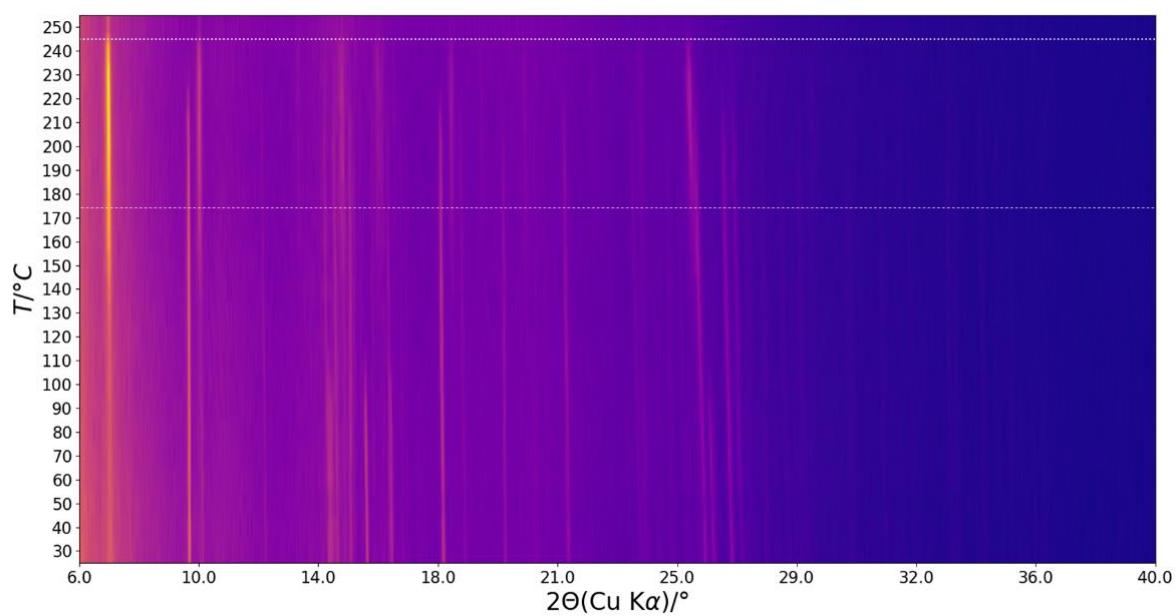

Figure S22. Temperature-dependent diffraction patterns of $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (**1**)

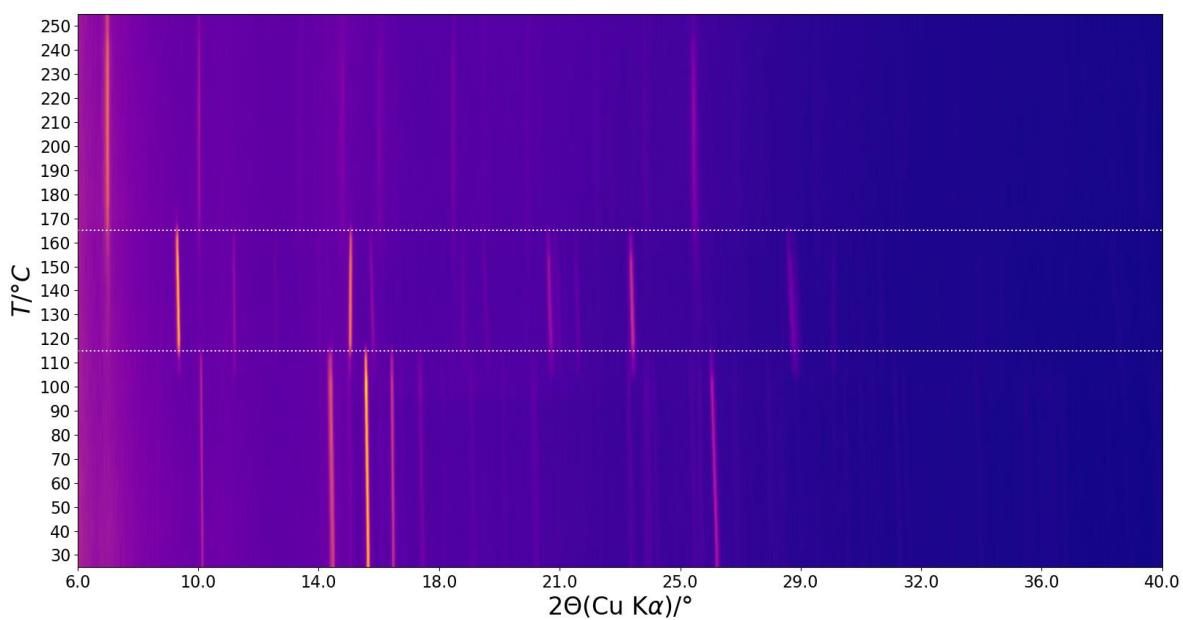

Figure S23. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$ (**2**)

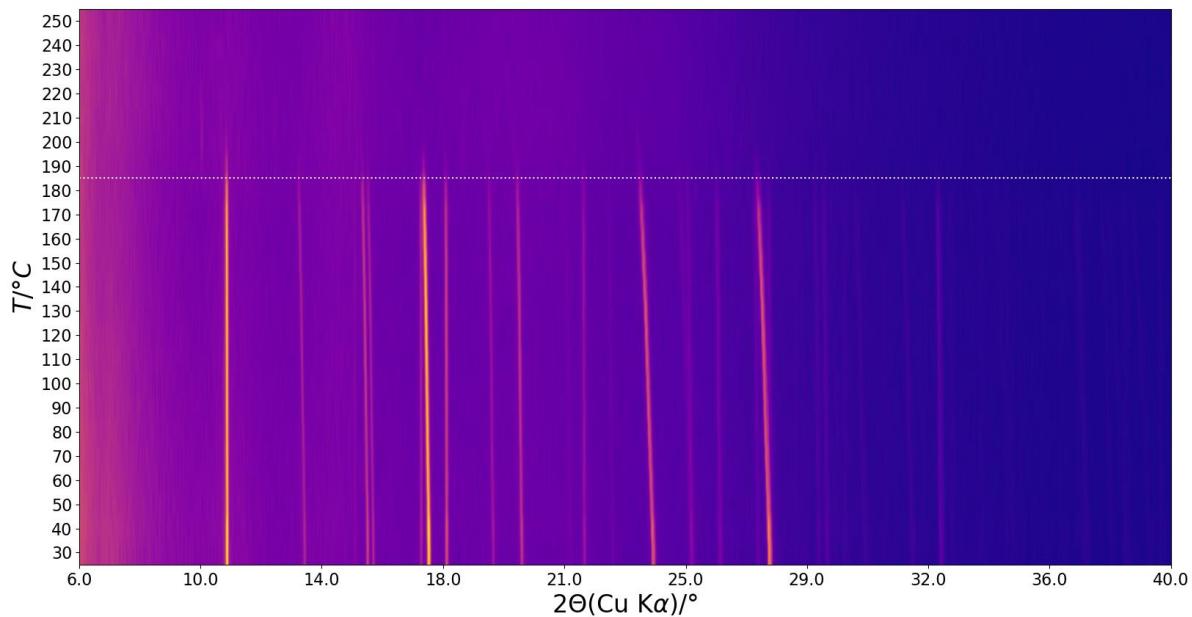

Figure S24. Temperature-dependent diffraction patterns of $[\text{VO}_2(\text{HL}^2)]$ (**4**)

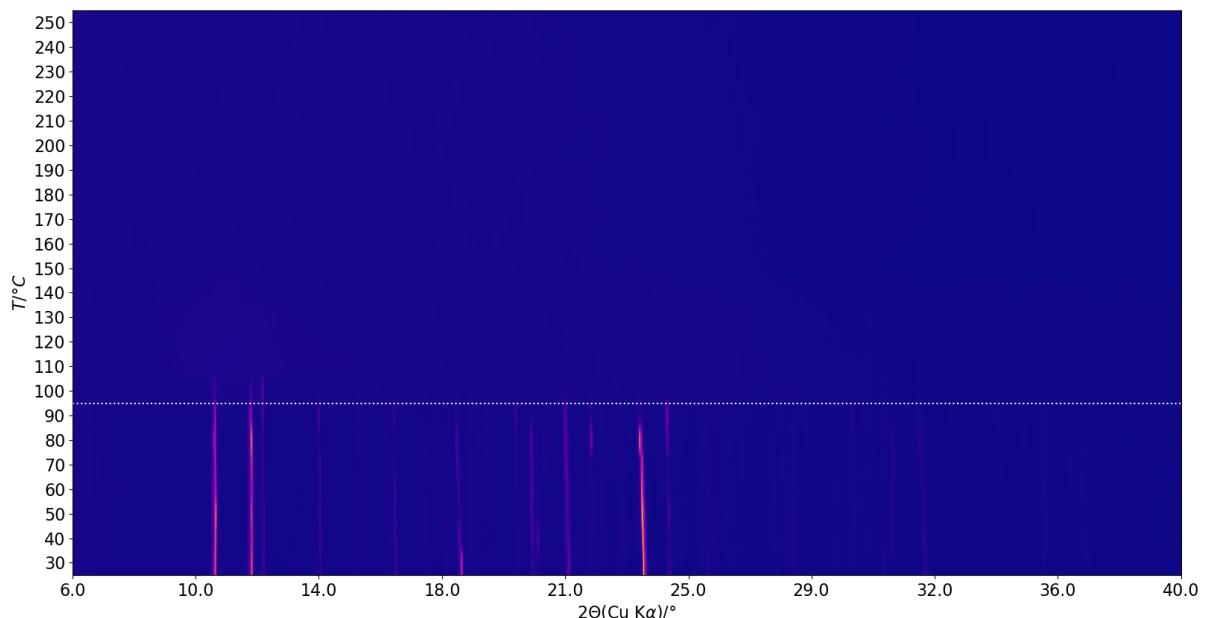

Figure S25. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^3)(\text{OEt})(\text{H}_2\text{O})]$ (**5**)

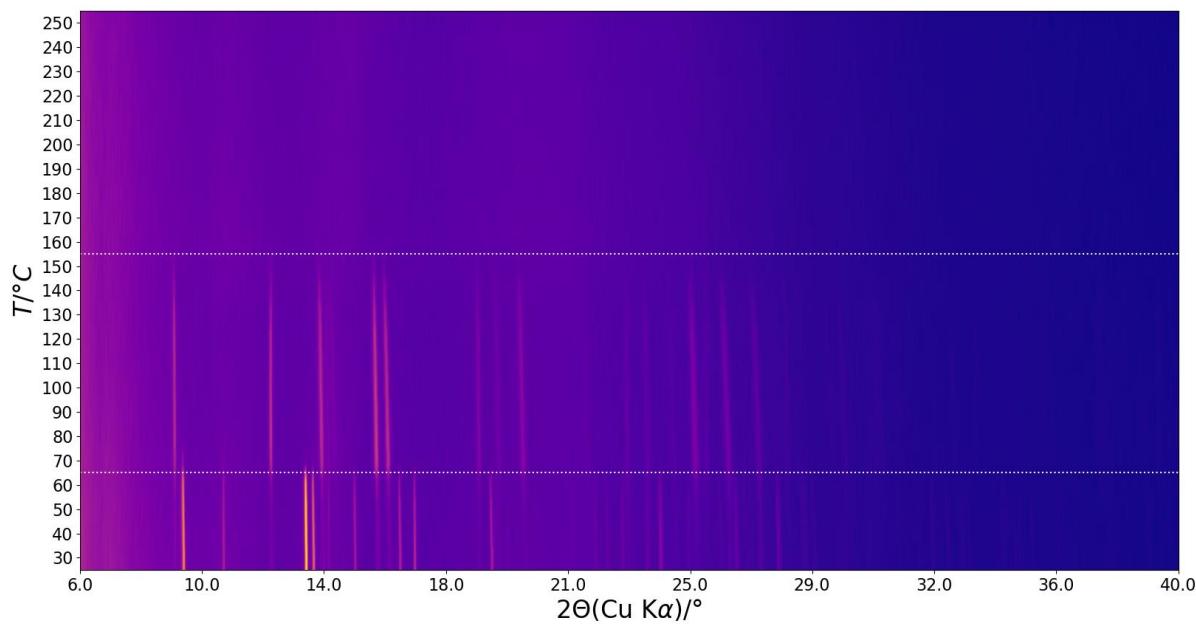

Figure S26. Temperature-dependent diffraction patterns of $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7)

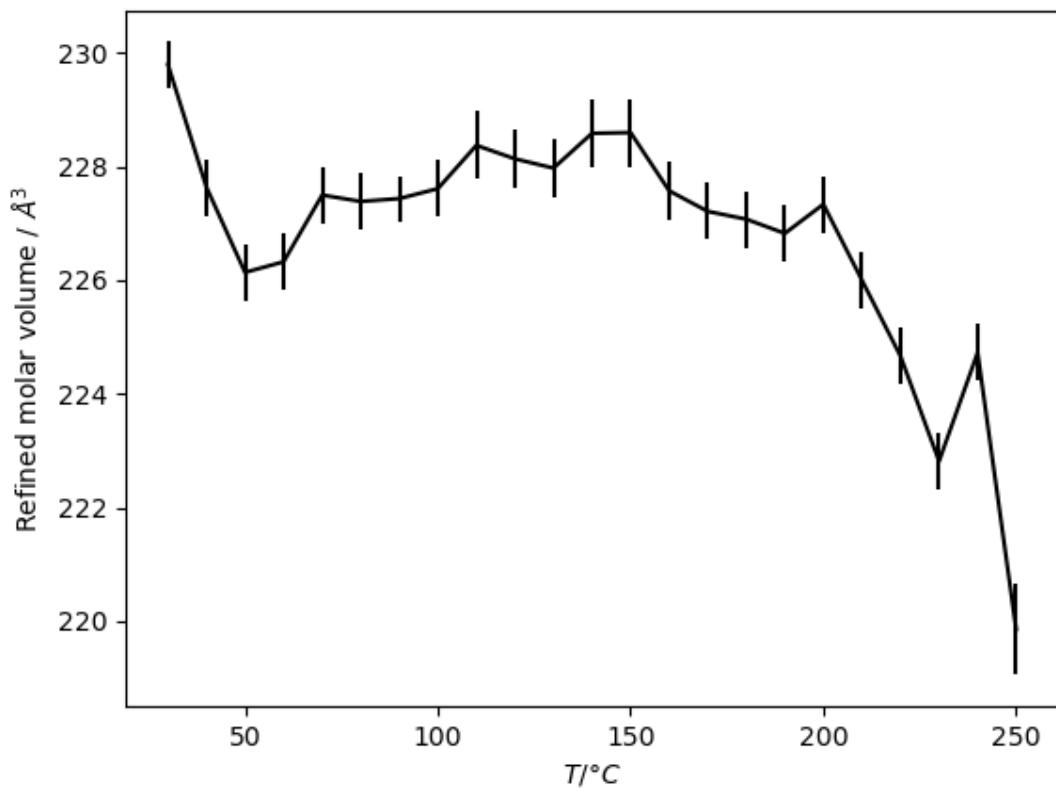

Figure S27. Temperature dependence of refined molar volume of the $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (1) compound, which is calculated as $\frac{1}{8}V_{cell}$. Vertical bars represent standard uncertainty. Due to poor crystallinity of the compound, and consequently low diffraction data quality, the molar volume could not be refined precisely, but the overall change across the whole temperature range is insignificant - around 2%. However, above 160 °C the sample converts to another phase with similar unit cell parameters.

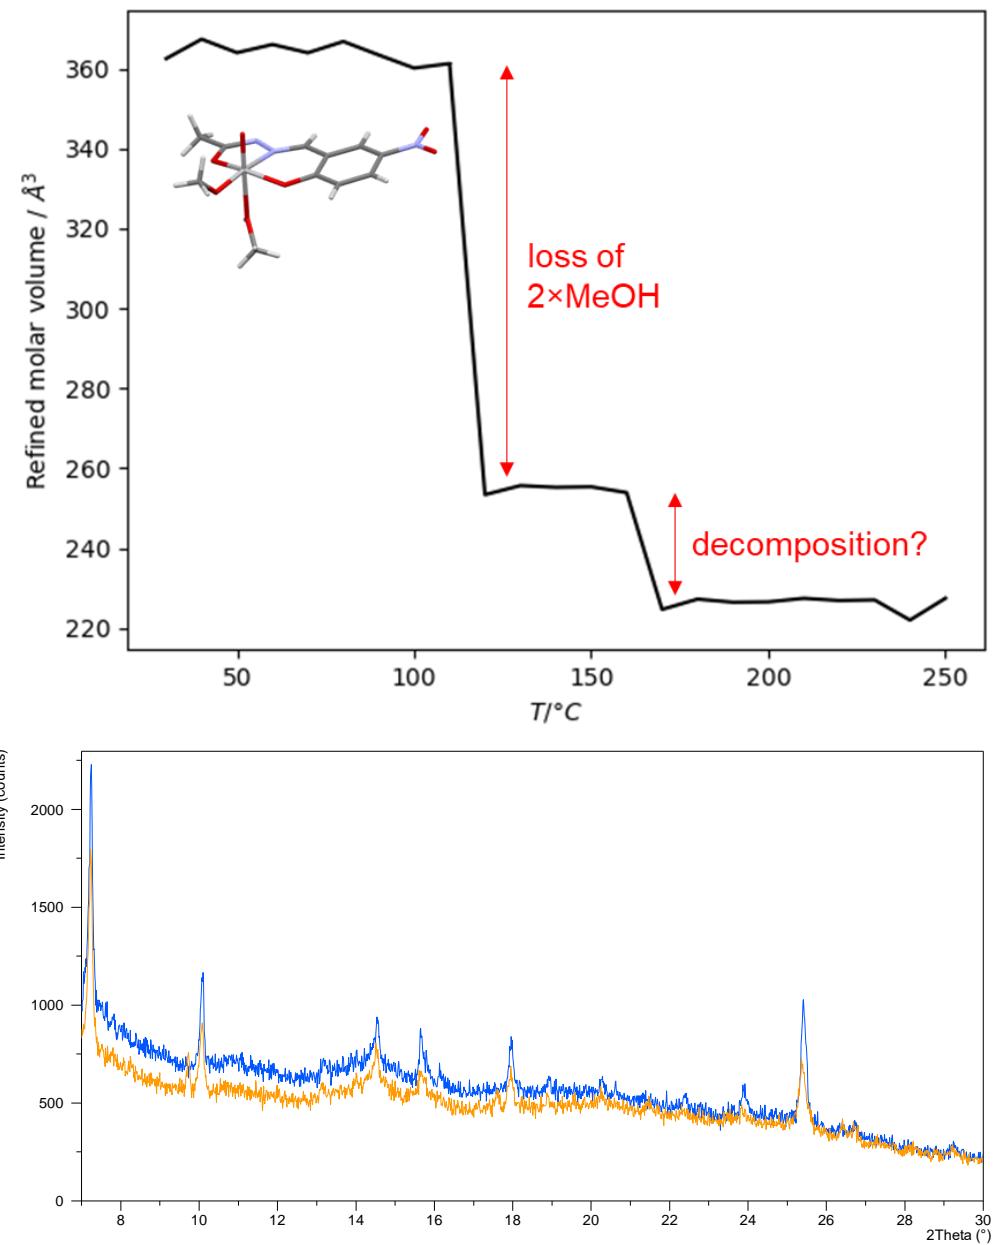

Figure S28. (Top) Temperature dependence of refined molar volume of the $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$ (**2**) compound, which is calculated as $\frac{1}{4}V_{cell}$ below $160\text{ }^\circ\text{C}$, and $\frac{1}{8}V_{cell}$ above it. Standard uncertainties are very low, and not visible in the graph. At low temperatures the molar volume corresponds to the $\text{VO}(\text{L})$ moiety ligated with methoxy/methanol ligands. Above $110\text{ }^\circ\text{C}$ the change in molar volume corresponds to the loss of two methanol molecules per moiety (ca. 100 \AA^3 as calculated from methanol crystal structure). (Bottom) Above $160\text{ }^\circ\text{C}$ sample probably converts to $[\text{VO}_2(\text{HL}^1)]$, the same phase observed in high temperature PXRD patterns of $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ (**1**).

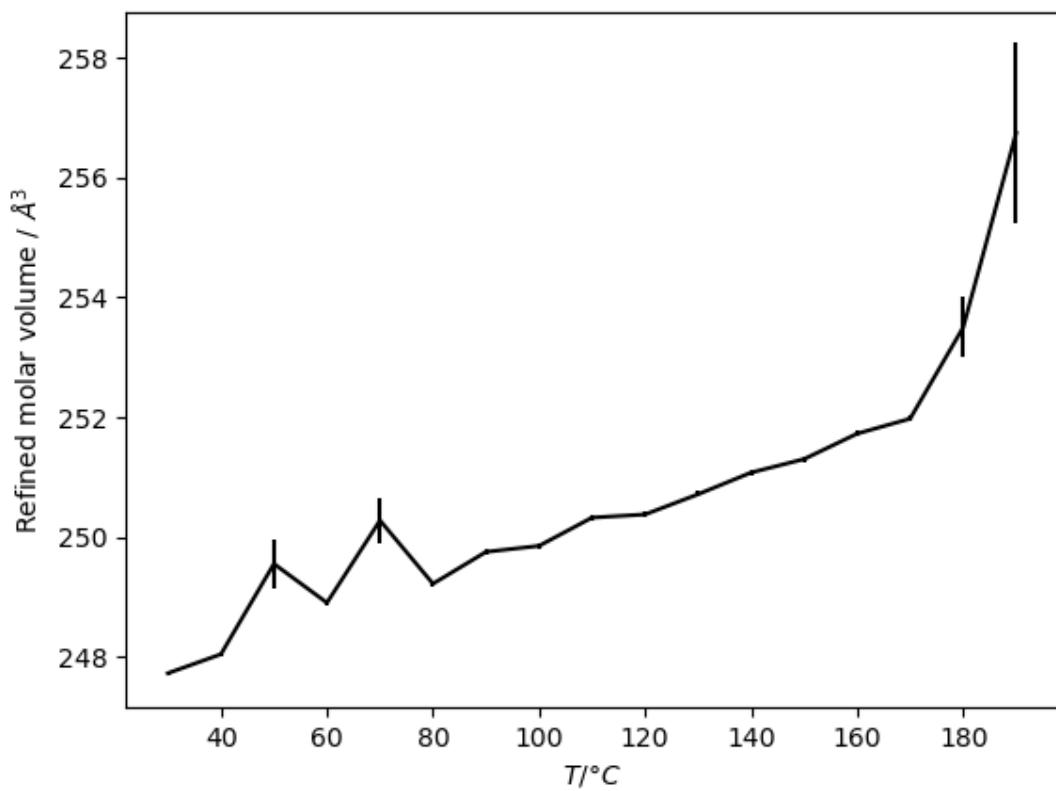

Figure S29. Temperature dependence of refined molar volume of the $[VO_2(HL^2)]$ (**4**) compound, which is calculated as $\frac{1}{4}V_{cell}$. Vertical bars represent standard uncertainty. Molar volume increases smoothly across the whole temperature range, and the overall change across the whole temperature range is insignificant - around 4%. Partial amorphization begins at around 180 °C, as evidenced by high uncertainty of molar volume at those temperatures.

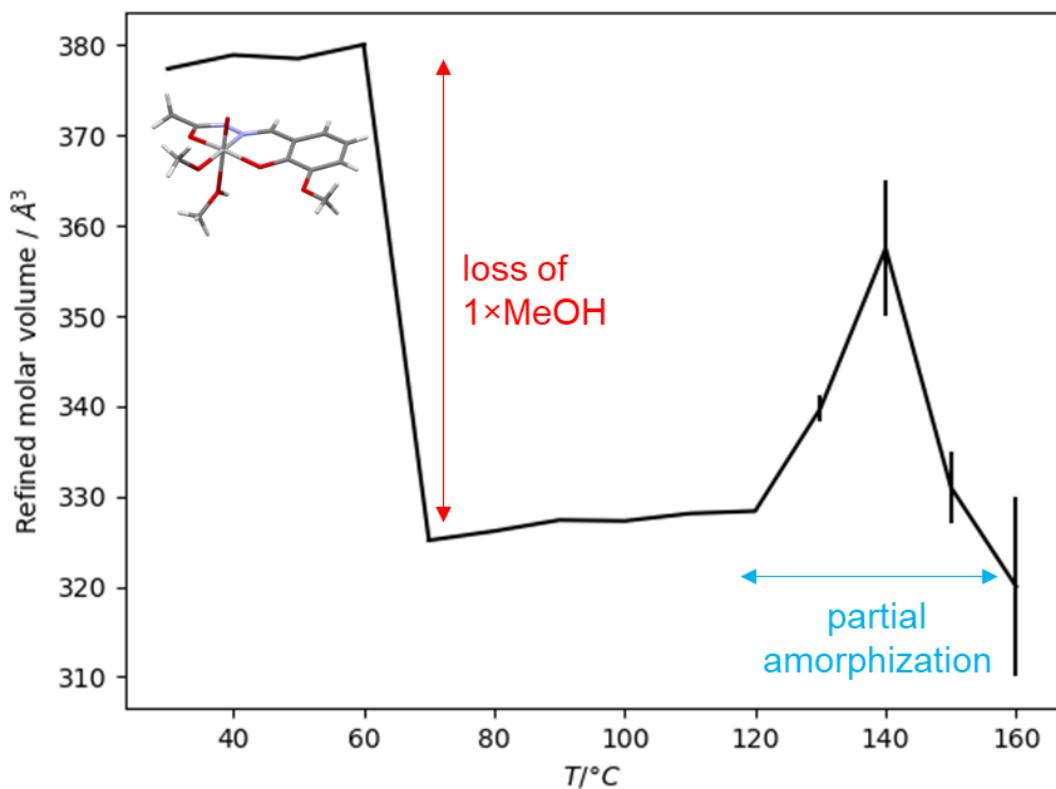

Figure S30. Temperature dependence of refined molar volume of the $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (7) compound, which is calculated as $\frac{1}{4}V_{\text{cell}}$. Vertical bars represent standard uncertainty. At low temperatures the molar volume corresponds to the $\text{VO}(\text{L})$ moiety ligated with methoxy/methanol ligands. Above 60 °C the change in molar volume corresponds to loss of one methanol molecule per moiety (ca. 50 Å³ as calculated from methanol crystal structure). Above 120 °C partial amorphization of the sample prevents precise refinements of molar volume.

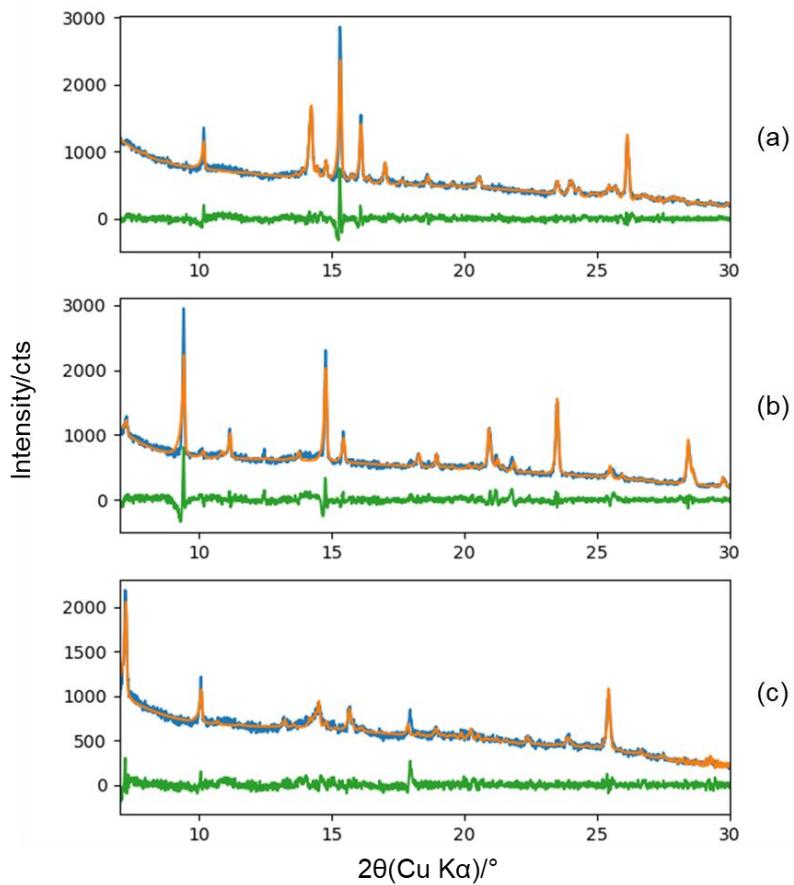

Figure S31. Examples of le Bail refinement on temperature-dependent PXRD data of $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$ (**2**), at (a) 30°C using unit cell parameters of $[\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})]$, (b) 140°C , unit cell parameters of intermediate phase: $a = 13.310(3)$ Å, $b = 9.9181(17)$ Å, $c = 8.6416(14)$ Å, $\alpha = 100.751(18)^\circ$, $\beta = 108.367(10)^\circ$, $\gamma = 101.710(17)^\circ$, (c) 200°C , unit cell parameters of $[\text{VO}_2(\text{HL}^1)]$, $a = 15.2143(15)$ Å, $b = 12.8189(13)$ Å, $c = 9.7818(11)$ Å, $\alpha = 107.074(10)^\circ$, $\beta = 93.985(11)^\circ$, $\gamma = 93.584(9)^\circ$. The refinement results for (c) are similar to high temperature phase of $(\text{NH}_4)[\text{VO}_2(\text{L}^1)]$ results.

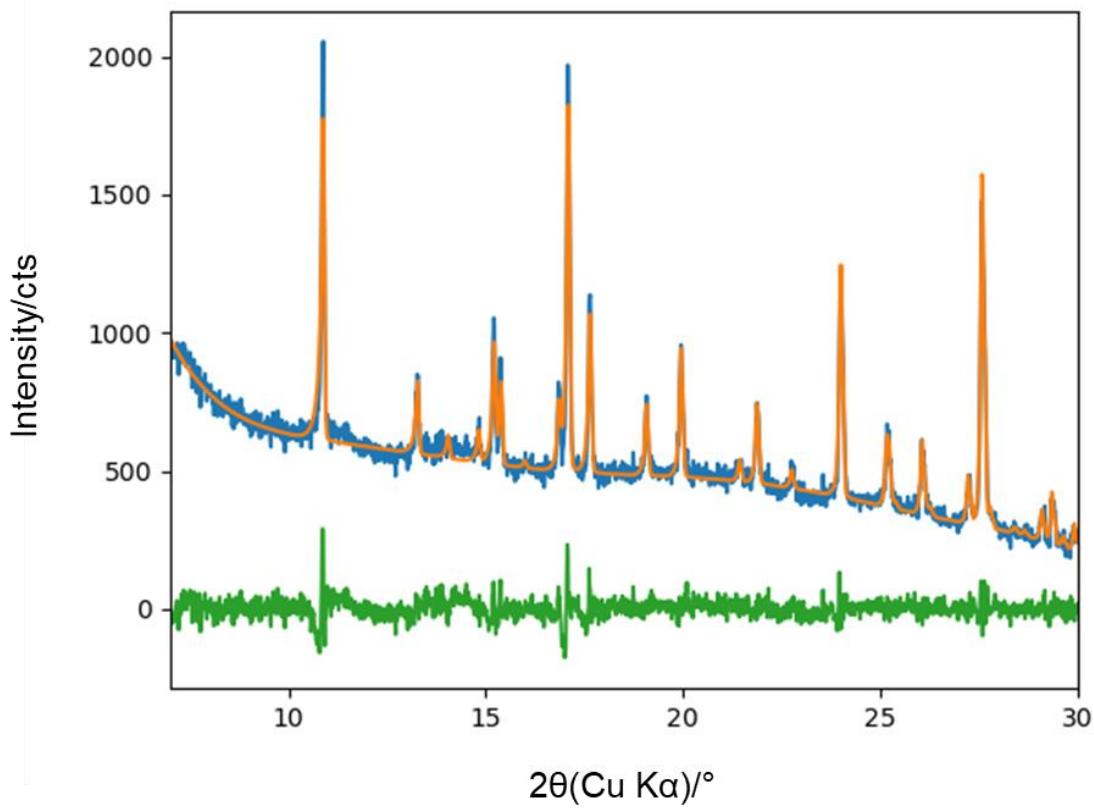

Figure S32. Example of le Bail refinement on temperature-dependent PXRD data of $[\text{VO}_2(\text{HL}^2)]$ (**4**), at 30 °C using unit cell parameters of $[\text{VO}_2(\text{HL}^2)]$ (**4**).

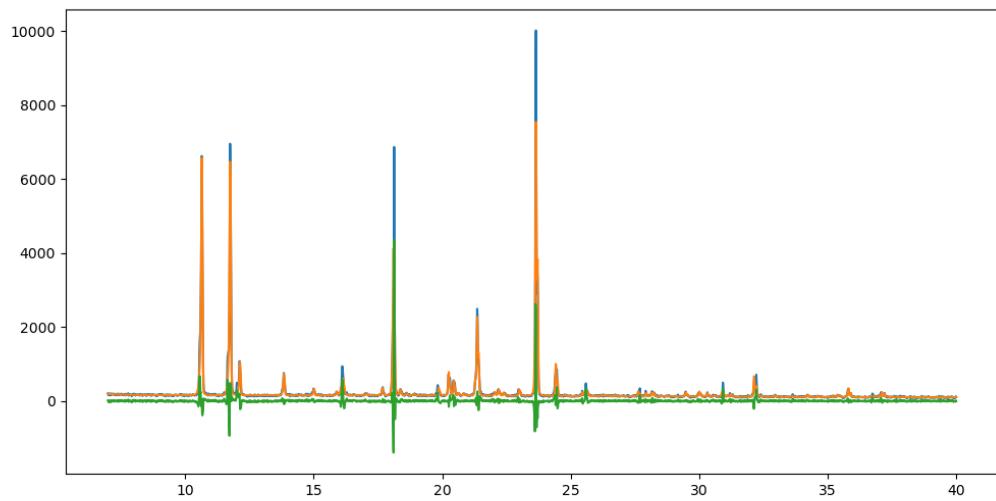

Figure S33. Example of le Bail refinement on temperature-dependent PXRD data of $[\text{VO}(\text{L}^3)(\text{OEt})(\text{H}_2\text{O})]$ (**5**), at 30 °C using cell parameters of $[\text{VO}(\text{L}^3)(\text{OEt})(\text{H}_2\text{O})]$ (**5**).

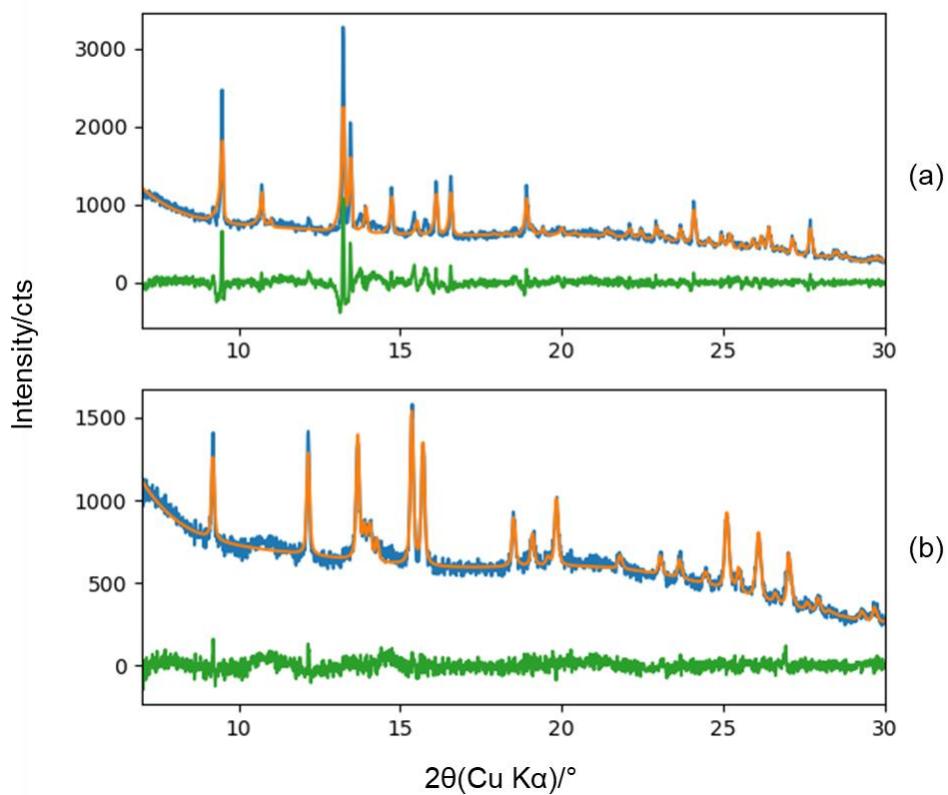

Figure S34. Examples of le Bail refinement on temperature-dependent PXRD data of $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (**7**), at (a) 30 °C using unit cell parameters of $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ (**7**), (b) 100 °C, unit cell parameters of high-temperature phase: $a = 14.532(3)$ Å, $b = 12.726(3)$ Å, $c = 7.0829(10)$ Å, $\alpha = \gamma = 90^\circ$, $\beta = 92.019(9)^\circ$.

Table S8. Tabulated weighted residual (R_{wp}) and unit cell parameters refined by le Bail fit from temperature-dependent PXRD data.

Sample	T / °C	R_{wp}	$a/\text{\AA}$	$b/\text{\AA}$	$c/\text{\AA}$	$\alpha/^\circ$	$\beta/^\circ$	$\gamma/^\circ$	$V/\text{\AA}^3$

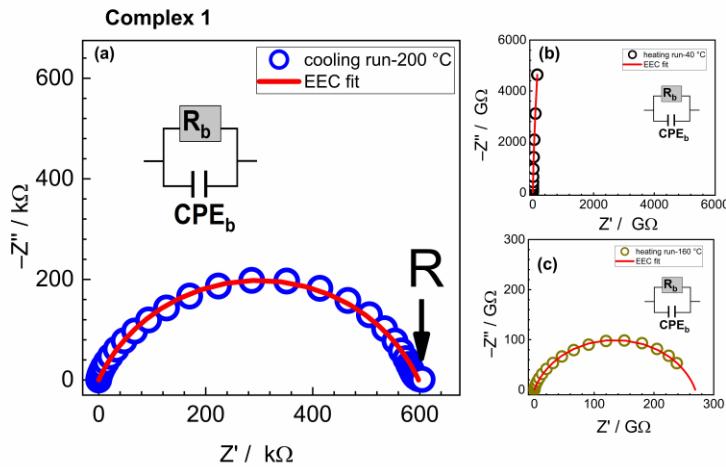

Fig S35.: Complex impedance spectra for **complex 1** at various temperatures in heating/cooling run. The coloured open circles denote experimental values, whereas the solid red line corresponds to the best fit. The corresponding equivalent circuit model is composed of parallel combinations of the resistor (R) and the constant-phase element (CPE), used for fitting the data of individual spectra.

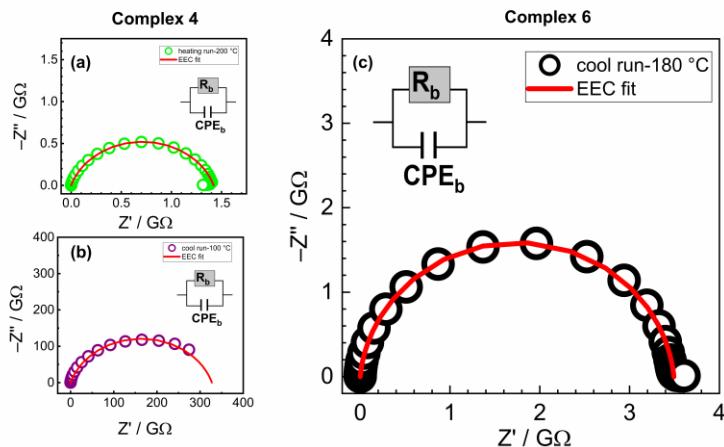

Fig S36. Complex impedance spectra for **complex 4** (a,b) and **complex 6** (c), at various temperatures in heating/cooling run. The coloured open circles denote experimental values, whereas the solid red line corresponds to the best fit. The corresponding equivalent circuit model is composed of parallel combinations of the resistor (R) and the constant-phase element (CPE), used for fitting the data of individual spectra.

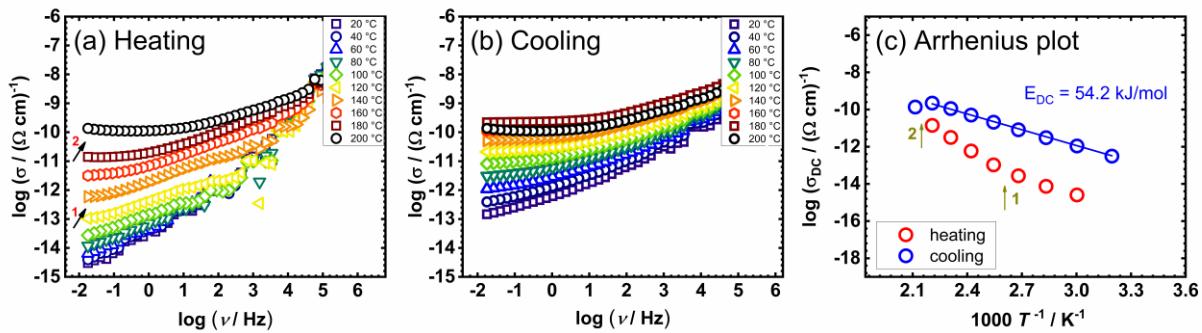

Figure S37. Conductivity spectra for mononuclear $\text{VO}(\text{L}^1)(\text{OMe})(\text{MeOH})$ sample (complex **2**) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).

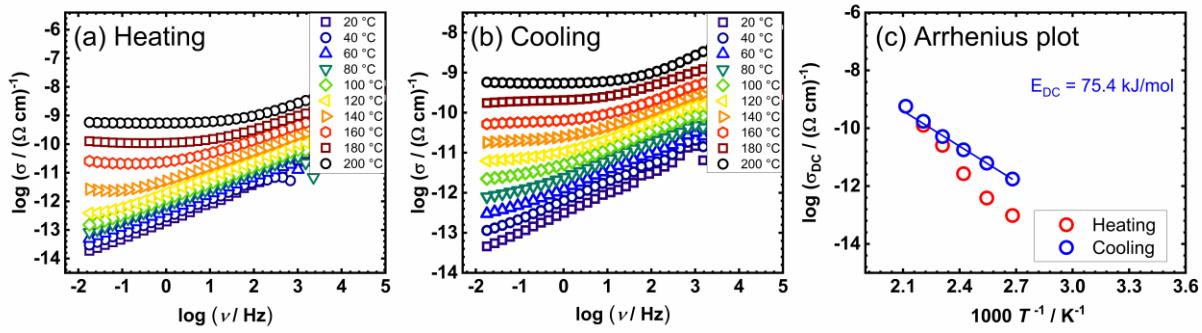

Figure S38. Conductivity spectra for mononuclear $[\text{VO}_2(\text{HL}^2)]$ sample (complex **4**) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).

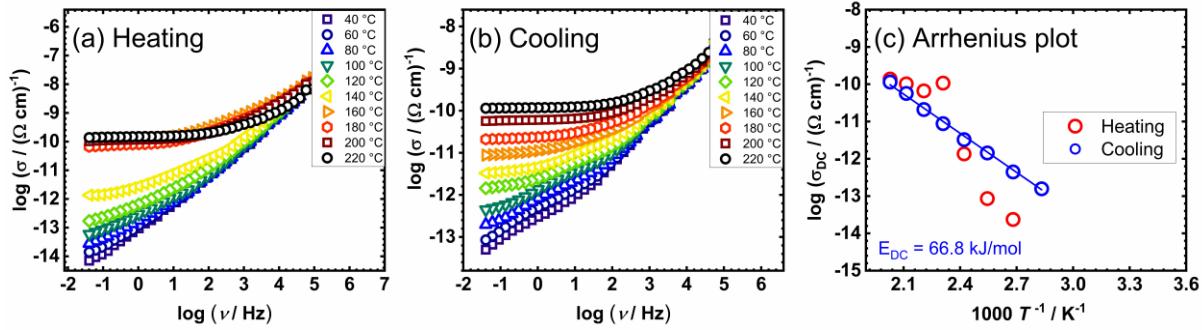

Figure S39. Conductivity spectra for mononuclear $[\text{VO}(\text{L}^3)(\text{OMe})(\text{MeOH})]$ sample (complex **7**) in heating (a) and cooling (b) runs, and (c) temperature dependence of DC conductivity ($\log(\sigma_{DC})$ vs. $1000/T$) for both runs (red circle—heating, blue circle—cooling).
