The relaxation time τ is required to calculate the electrical conductivity. By utilizing the deformation potential (DP) theory, in combined with the effective mass approximation, the τ can be calculated as⁶

$$\tau = \frac{um^*}{e} = \frac{2\hbar^3 C}{3k_B T m^* E} \quad (\text{S3})$$

$$C = [\partial^2 E / \partial(\Delta a/a_0)^2] / S_0 \quad (\text{S4})$$

where C is the elastic constant, e is the deformation potential energy, m^* is the effective mass, u is the mobility of carriers, including electrons and holes, \hbar is the reduced Planck constant, T is the temperature, E is the total energy of the system. Δa is the change of the lattice constant, $\Delta a/a_0$ is the magnitude of the uniaxial stress, and S_0 is the bottom area of the two-dimensional material.
