#### $[\text{Fe}(\text{bipy}^{\text{Br}})_3]\text{Cl}_2$

$\text{FeCl}_2$  (17.9 mg, 0.141 mmol) and  $\text{bipy}^{\text{Br}}$  (137.5 mg, 438 mmol, 3.1 equivalents) were suspended in MeCN (2 mL) and stirred for 3 days. The suspension was cooled to  $-30\text{ }^\circ\text{C}$ , and the blue-grey precipitate was isolated by filtration, washed with MeCN (2 mL) and dried to give the product as a blue-grey powder (138.9 mg, 0.1300 mmol, 92%).

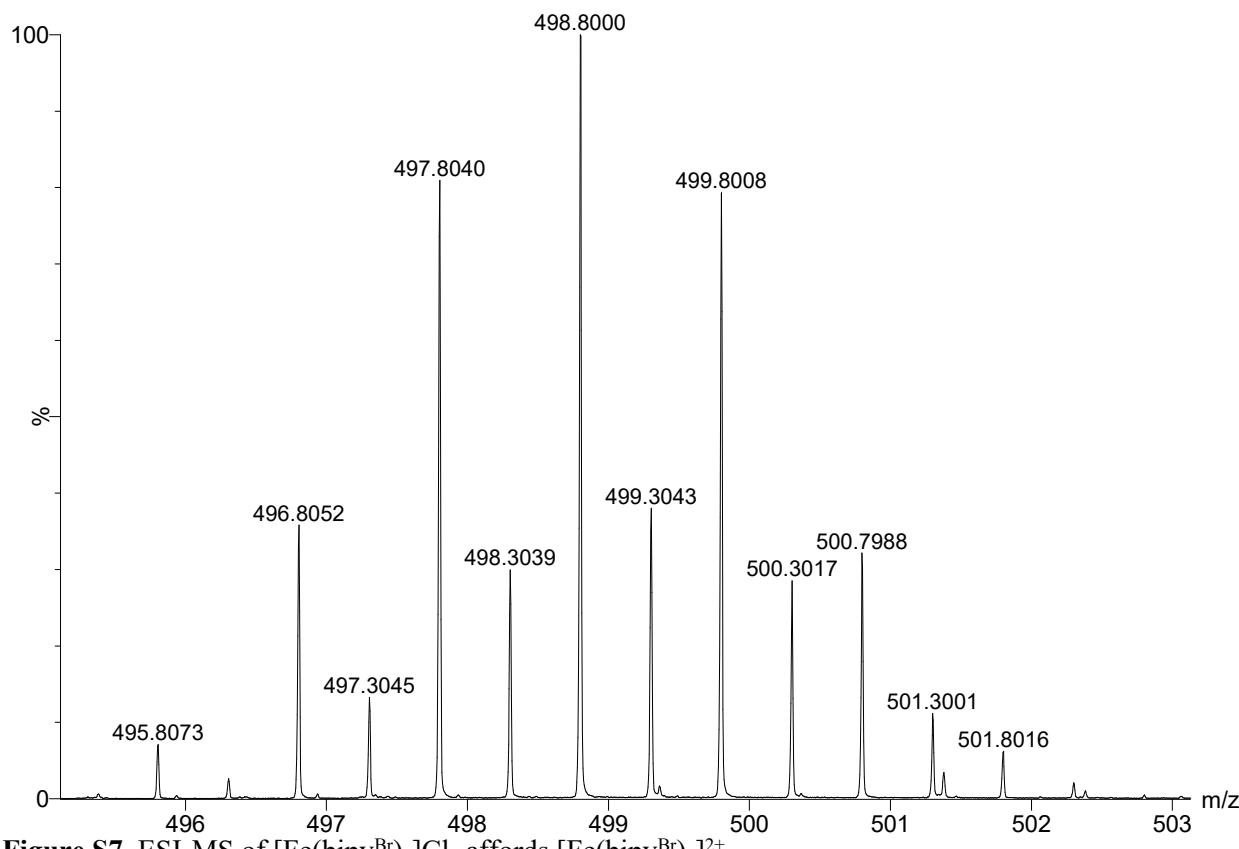

$^1\text{H}$  NMR:  $\delta$  9.08 (s, 6H, H<sub>3,3'</sub>), 7.75 (m, 6H, H<sub>6,6'</sub>), 7.37 ppm (m, 6H, H<sub>5,5'</sub>).  $^{13}\text{C}\{\text{H}\}$  NMR:  $\delta$  160.39, 156.01, 137.70, 132.71, 129.78 ppm. ### Mass Spectrometry

Stock solutions were prepared using HPLC-grade MeOH and deionized/millipore-filtered  $\text{H}_2\text{O}$ .  $[\text{Fe}(\text{bipy})_3]\text{Cl}_2$ ,  $[\text{Fe}(\text{phen})_3]\text{Cl}_2$ ,  $[\text{Fe}(\text{bipy}^{\text{Br}})_3]\text{Cl}_2$ ,  $[\text{Fe}(\text{bipy}^{\text{t-Bu}})_3]\text{Cl}_2$ ,  $[\text{Co}(\text{bipy})_3](\text{PF}_6)_2$ ,  ${}^n\text{Bu}_4\text{NOAc}$ ,  $\text{NaBPh}_4$  and  $\text{NaBAr}^{\text{F}}$  solutions were prepared and stored in a refrigerator.

Solutions of the heteroleptic complexes were typically prepared by diluting stock solutions (0.25 mM in MeOH) of  $[\text{Fe}(\text{bipy})_3]\text{Cl}_2$  (10  $\mu\text{L}$ ) and  $[\text{Fe}(\text{phen})_3]\text{Cl}_2$  (10  $\mu\text{L}$ ) with MeOH (980  $\mu\text{L}$ ), such that that  $[[\text{Fe}(\text{N}^{\text{N}}\text{N})_3]]^{2+} = 2.5 \mu\text{M}$ . Higher concentration solutions were used in some cases. A syringe pump infused these solutions ( $10 \mu\text{L min}^{-1}$ ) into a Waters Synapt XS ion-mobility mass spectrometer, equipped with a standard ESI probe and LockSpray II source. The generated ions encounter a resolving quadrupole, travelling-wave ion-mobility cell and then a time-of-flight analyzer. Data were acquired in High Resolution positive-ion mode with: cone 10 V, source offset 4.5, source 80 °C, and  $\text{N}_2$  desolvation temperature 200 °C. MS data were acquired at a capillary voltage of ~1.51 kV.  $\text{MS}^2$  data were acquired at a capillary voltage of 1.25 kV, acquiring scans at different transfer collision energies until virtually all parent ions dissociated in the Ar gas. The low-mass resolution of the quadrupole was typically ~4, whence most isotopologs of the parent ions were transmitted. If necessary, the resolution was increased to ensure the parent ion was pure. 10 MS scans were acquired at each capillary voltage and 10  $\text{MS}^2$  scans were acquired at each transfer collision energy. The spectra were combined and integrated in MassLynx v4.2. Breakdown curves were fitted with Boltzmann sigmoids to obtain  $CE_{1/2}$  values.

**Table S1.** In each case, prior to ETD measurement the  $[Fe(N^N)_3]^{2+}$  parent ion was measured in ESI-MS<sup>2</sup> mode using the settings below. This helped ensure the intensities of  $[Fe(N^N)_3]^{2+}$  were comparable prior to interaction with DCB<sup>-</sup>.

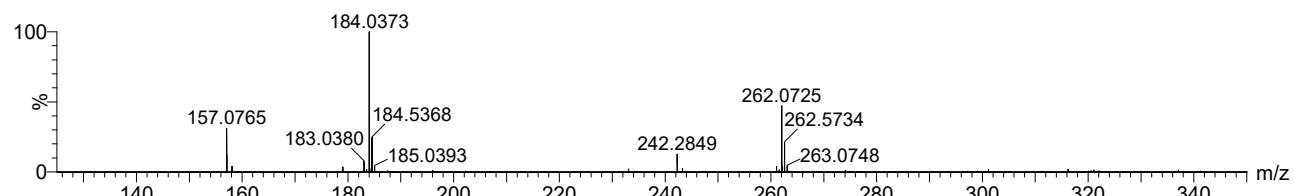

| Salt                      | C / $\mu$ M | LM resolution |
|---------------------------|-------------|---------------|
| $[Fe(bipy)_3]Cl_2$        | 2.5         | 17.0          |
| $[Fe(bipy^{Br})_3]Cl_2$   | 20          | 17.0          |
| $[Fe(phen)_3]Cl_2$        | 2.5         | 17.8          |
| $[Fe(bipy^{t-Bu})_3]Cl_2$ | 10          | 20.0          |

For MS-IMS-MS, we used a capillary voltage of 1.00 kV and a low-mass resolution of 15 to select the most intense isotopologs of the parent ion envelope to enter the N<sub>2</sub>-filled mobility cell. The final mobilograms are of the most intense isotopolog. The traveling voltage wave velocity was 4.6 ms<sup>-1</sup> and the wave height was 18.8 V. In each case, 294 scans were acquired and arrival times  $t_d$  visualized using DriftScope v3.0.

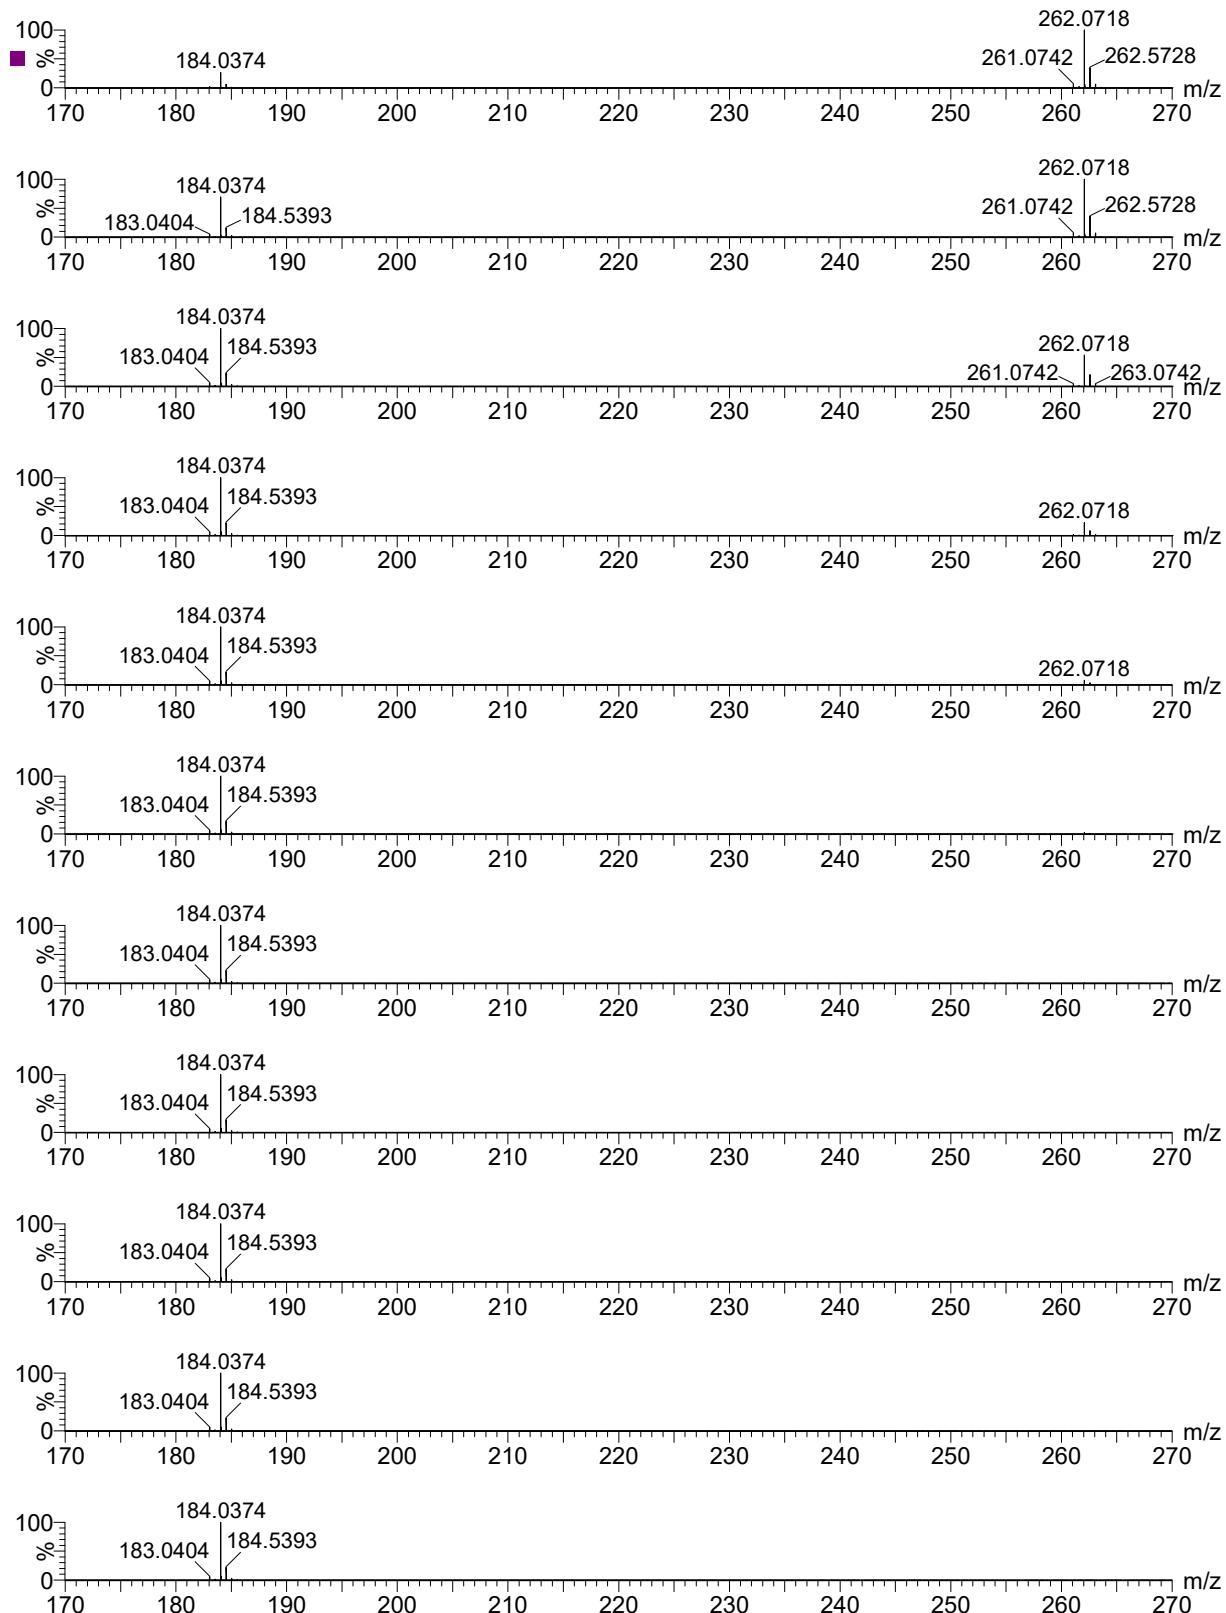

Solutions for ligand exchange experiments were held at 26 °C using a Thermo Scientific bath (88880029). The spectra presented are sums of 20 scans.
