Hydrogen-Bond-Assisted Conformational Selection of Picaridin in the Gas Phase

Otger Crehuet,^{a,b} Andrea Vázquez,^{a,b} Francisco J. Basterretxea,^a Pablo Pinacho,^{*,a,c} and Emilio Cocinero^{*,a,b}

Understanding the intrinsic shape of bioactive molecules such as picaridin is key to elucidating their mode of action. In this work, we characterize the gas-phase conformational landscape of picaridin, a flexible chiral repellent with two stereocenters. Broadband rotational spectroscopy combined with quantum chemical calculations reveals a single dominant conformer per enantiomeric pair, both stabilized by internal O–H···O hydrogen bonds. These intramolecular interactions induce conformational locking, constraining the hydroxyethyl chain and favouring a compact geometry. Non-covalent interaction analysis further confirms that dispersion and hydrogen bonding play a central role in conformational selection under isolated conditions.

List of figures:

Figure S1. Predicted conformations and energies for the picaridin (*R,R/S,S*) pair.

Figure S2. Predicted conformations and energies for the picaridin (*S,R/R,S*) pair.

Figure S3. Rotational spectrum of picaridin.

Figure S4. Potential energy scan for conformational relaxation for conformers II to I for picaridin (*R,R/S,S*) and (*S,R/R,S*).

Figure S5. Potential energy scan for conformational relaxation for the remaining conformers of picaridin (*R,R/S,S*).

Figure S6. Potential energy scan for conformational relaxation for the remaining conformers of picaridin (*S,R/R,S*).

List of tables:

Table S1. Theoretical rotational parameters at B3LYP-D3(BJ)/def2-TZVP for the picaridin (*R,R/S,S*) diastereomer.

Table S2. Theoretical rotational parameters at B3LYP-D3(BJ)/def2-TZVP for the picaridin (*S,R/R,S*) diastereomer.

Table S3. Observed transition frequencies for the lowest energy conformer for the picaridin (*R,R/S,S*) diastereomer.

Table S4. Observed transition frequencies for the lowest energy conformer for the picaridin (*S,R/R,S*) diastereomer.

Figure S1. Predicted (B3LYP-D3(BJ)/def2-TZVP) conformations and relative zero-point corrected energies given in kJ/mol for picaridin (*R,R/S,S*) pair. Black line represents the intramolecular hydrogen bonding.

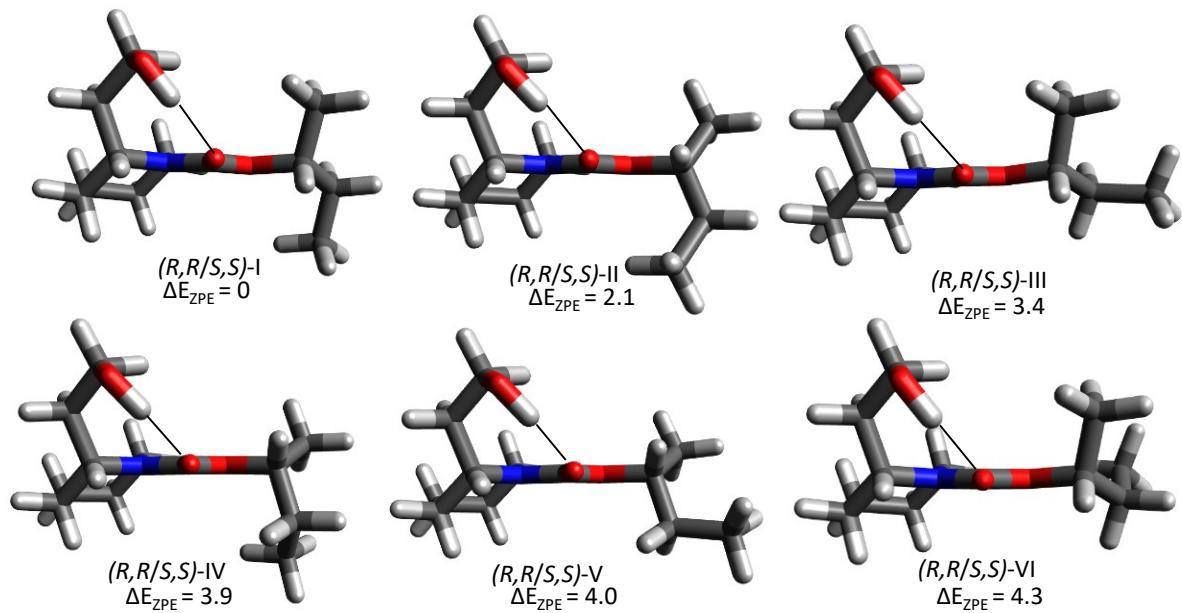

Figure S2. Predicted (B3LYP-D3(BJ)/def2-TZVP) conformations and relative zero-point corrected energies given in kJ/mol for picaridin (*S,R/R,S*) pair. Black line represents the intramolecular hydrogen bonding.

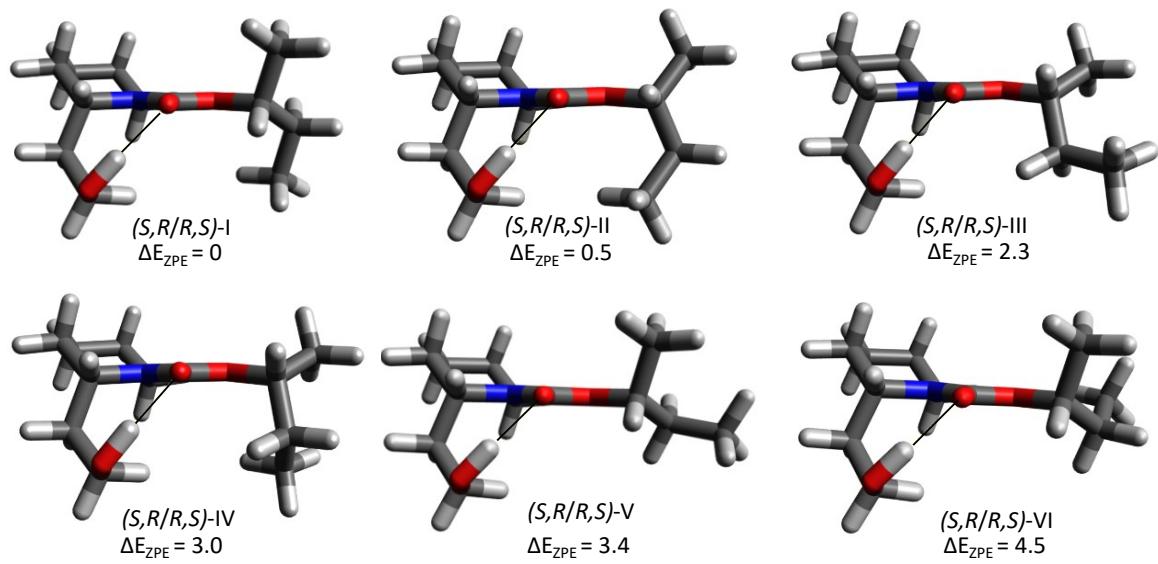

Figure S3. Rotational spectrum of picaridin in the 3-6 GHz range, experimental (upwards) and simulations based on the experimental rotational parameters for the two observed conformers (downwards).

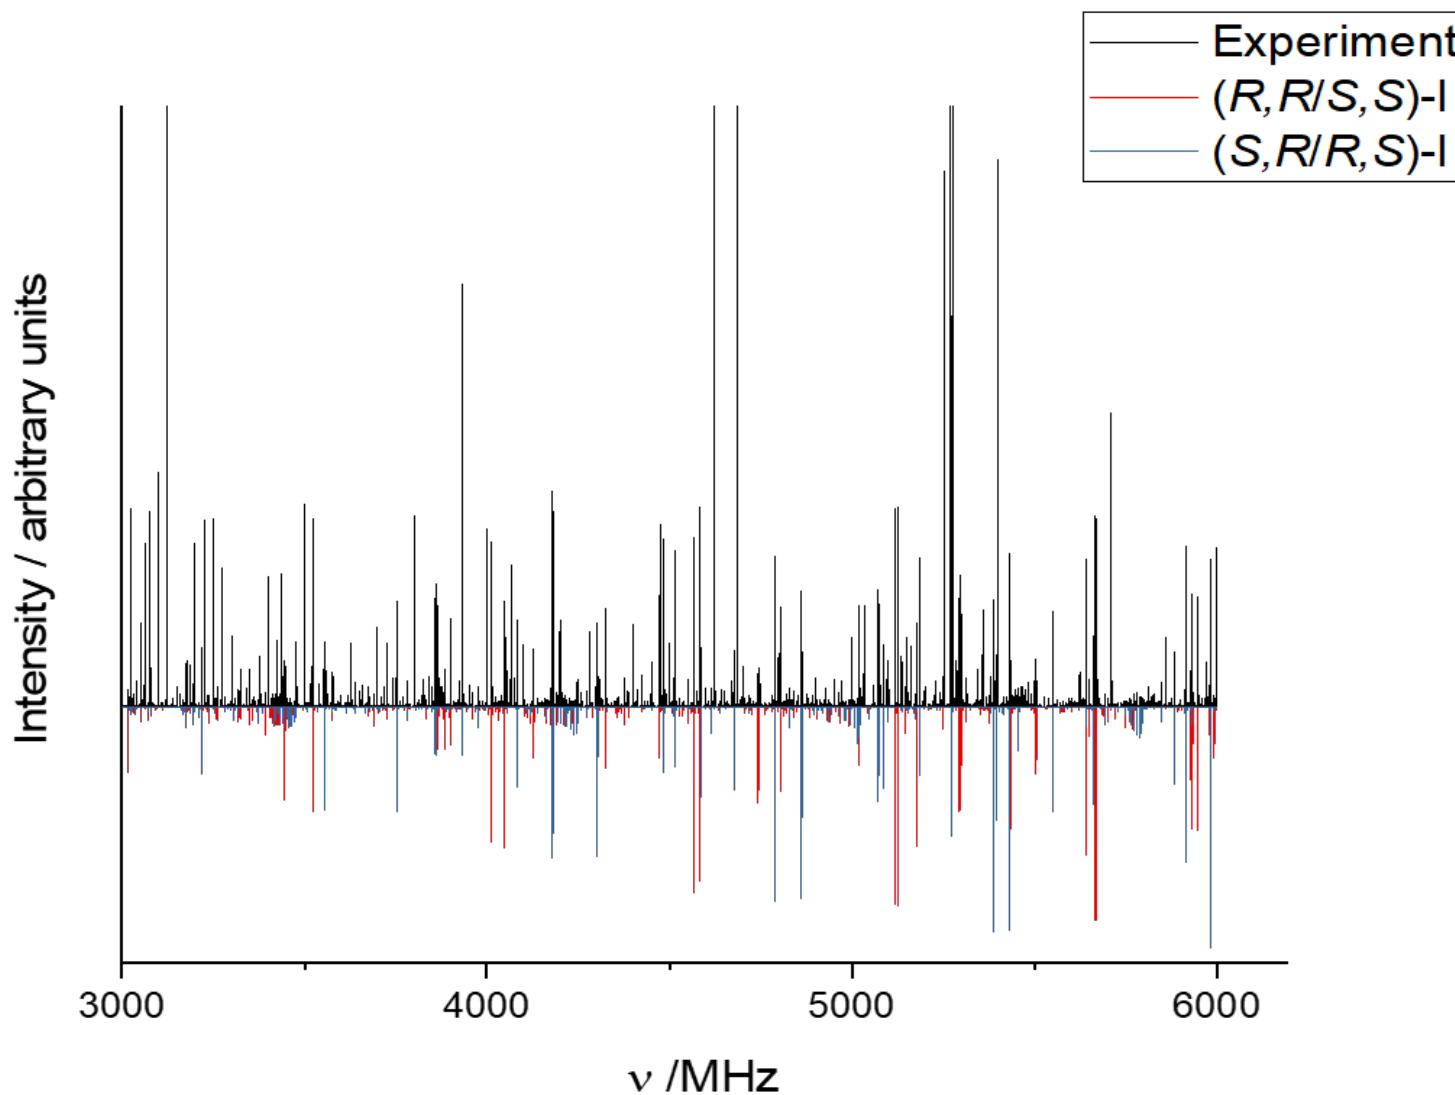

Figure S4. Potential energy scan for conformational relaxation from conformer II to I for both diastereomeric pairs (*R,R/S,S* and *S,R/R,S*) at the B3LYP-D3(BJ)/def2-TZVP level of theory. The graph scans ϕ dihedral angle (C7–O9–C11–C12) in steps of 10 degrees.

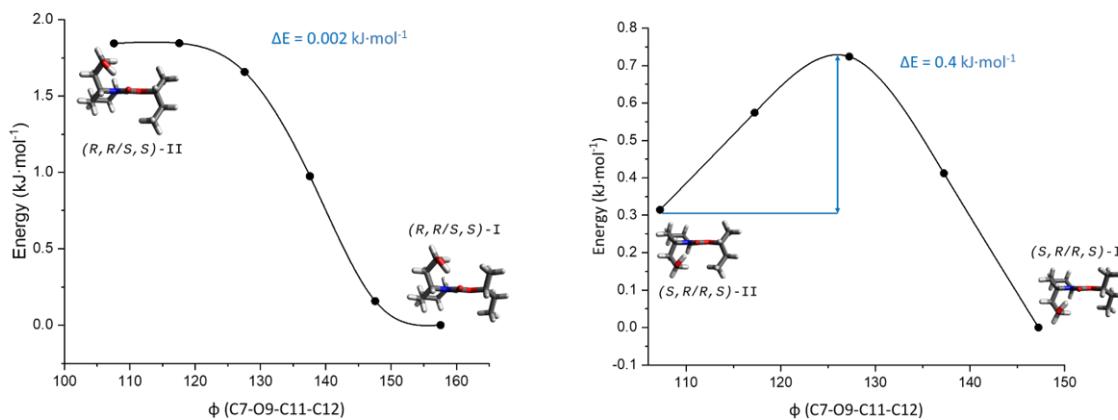

Figure S5. Potential energy scan for conformational relaxation from conformer III to I; V to I, VI to III; and IV to V for picaridin (*R,R/S,S*) at the B3LYP-D3(BJ)/def2-TZVP level of theory. The graph scans the δ (C10–C11–C12–C13) dihedral angle in steps of 10 degrees.

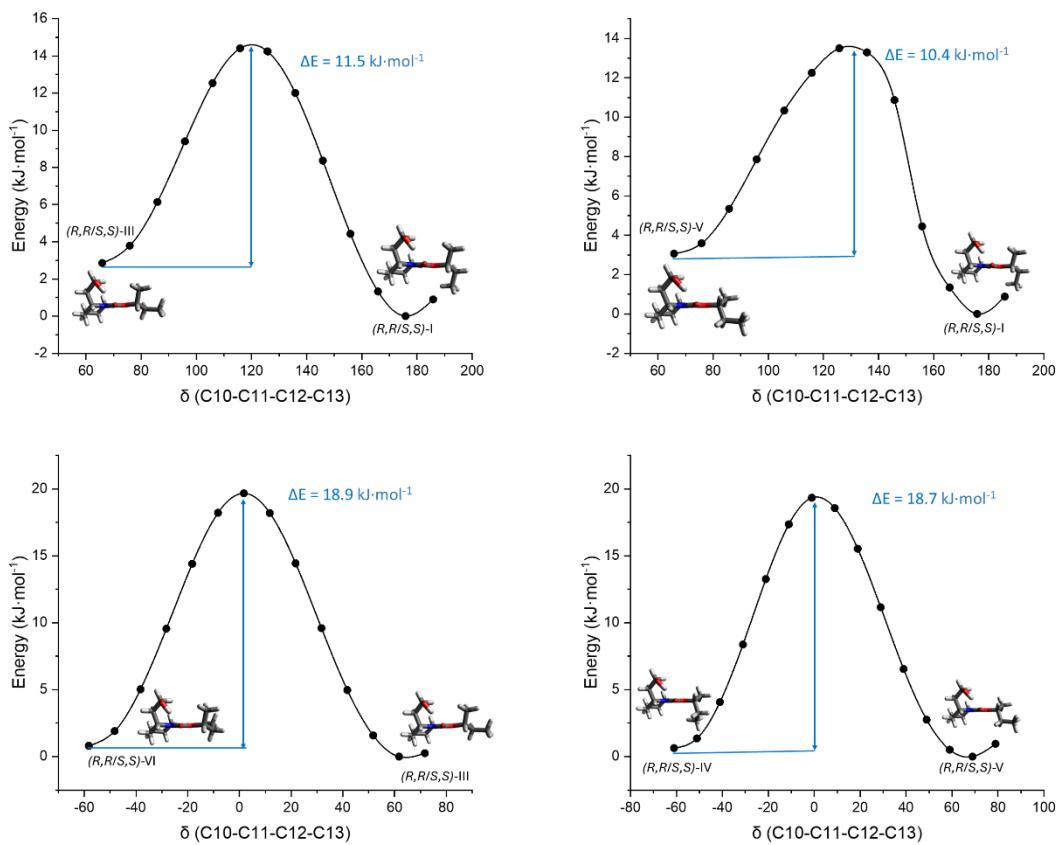

Figure S6. Potential energy scan for conformational relaxation from conformer III to II; IV to III, V to III; and VI to IV for picaridin (*S,R/S,R*) at the B3LYP-D3(BJ)/def2-TZVP level of theory. The graph scans the δ (C10-C11-C12-C13) or the ϕ (C7-O9-C11-C12) dihedral angles in steps of 10 degrees.

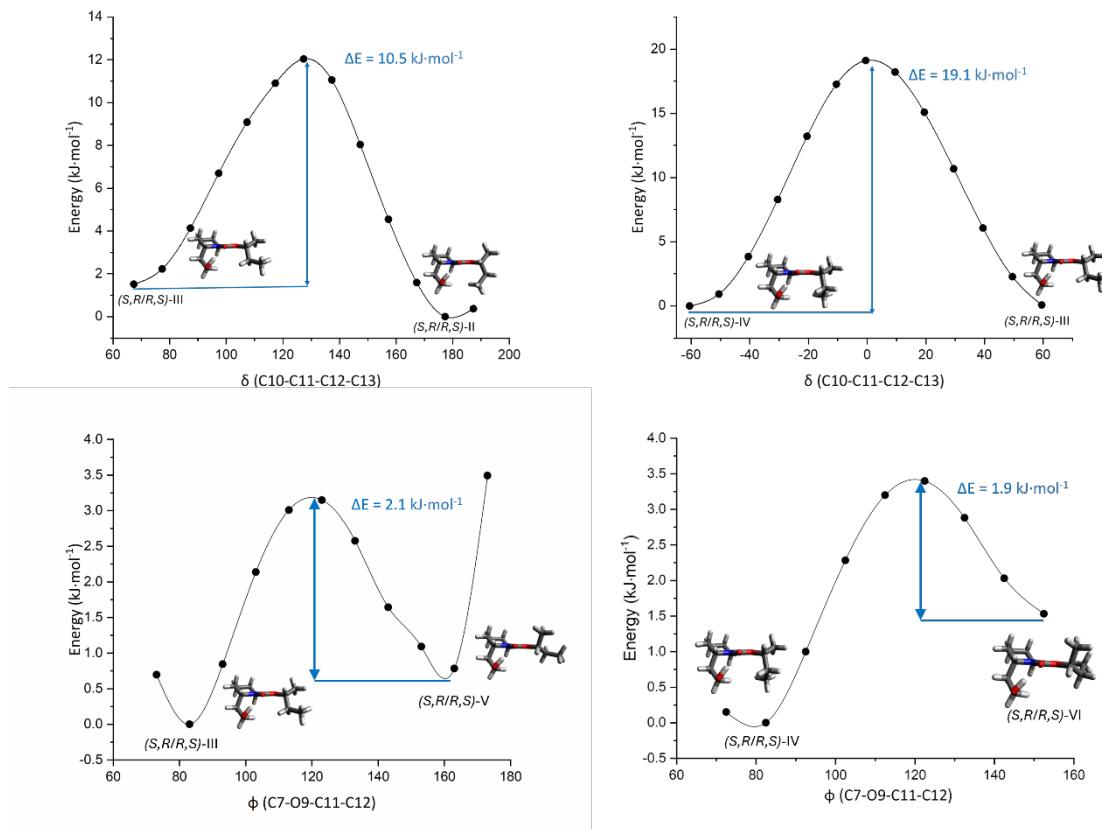

Table S1. Theoretical rotational parameters, dipole moments and planar moments of inertia for the picardin (*R,R/S,S*) conformers at B3LYP-D3(BJ)/def2-TZVP. Relative energies to the most stable conformer considering the zero-point energy correction are given.
