**Figure S1.** X-ray photoelectron spectroscopy (XPS) full survey spectrum of the sample, confirming the presence of Cs, Fe, Cl, C, O, and the Eu dopant elements. (a-e) 10% Eu added, (f-j) 5% Eu added, (k-o) unadded

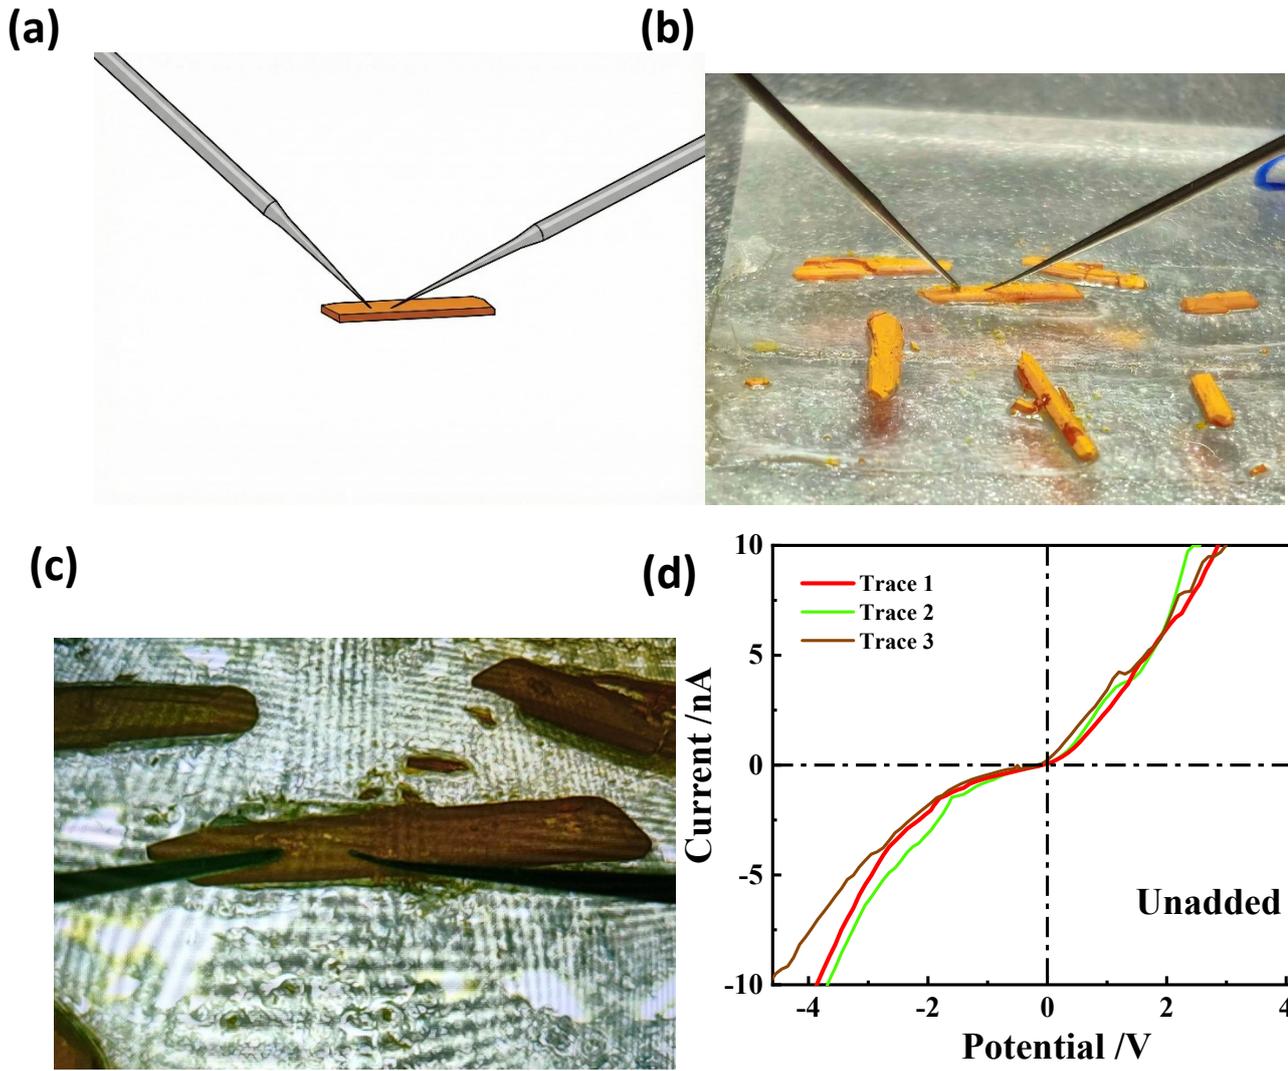

**Figure S2.** Reproducibility of the UV-Vis absorption and optical band-gap determination for unadded, 5% and 10%-added single crystals. (a) Absorption spectra of two independently grown crystals for each composition. (b-d) Corresponding Tauc plots of  $(\alpha h\nu)^2$  versus photon energy and linear extrapolation used to extract the direct bandgaps.

**Figure S3.** Reproducibility of spectra of unadded, 5% and 10%-added single crystals recorded under 230 nm excitation. All samples exhibit a broad emission band centred around 350 nm, while the overall PL intensity increases.
