General Procedure for Optimization Reactions.

General procedure for the optimization of the amount of aliphatic thiolates for $[\text{Co}_2(\text{PhBIMP})(\mu\text{-O}_2\text{C-C}_6\text{H}_3\text{-2,6-(OMe)}_2)(\text{DMF})](\text{BF}_4)_2$ (2d**(BF_4)₂).** To a mixture of **2d**(BF_4)₂ (0.015 mmol, 25.4 mg) and H₂O (300, 600, 750, 900, 1050 and 1200 equiv) in 0.5 mL of DMF was added a solution of NaSCH₂Ph in varying equivalents (10, 20, 25, 30, 35, and 40 equiv.) respectively in 0.5 ml DMF in separate sets and the mixtures were stirred for 60 h resulting in the formation of a pale pink colored solution along with a deep pink solid in each case. The resulting solution was filtered. The filtrate was diluted with Et₂O and kept overnight at -35 °C. The solution was then decanted off, diluted to 10 mL with Et₂O in a volumetric flask, and GC experiment was performed using the solution. The deep pink solid obtained was found to be insoluble in CH₂Cl₂, pentane, hexane, MeCN, MeOH, EtOH, THF, Toluene, CHCl₃ and DMSO. The yields of PhCH₂OH obtained were 8.85 equiv

Generation of hydrosulfide during the catalytic hydrolysis of NaSCH₂Ph using 2d(BF₄)₂ as the catalyst. To a mixture of 2d(BF₄)₂ (0.0150 mmol, 25.4 mg) and H₂O (15.75 mmol, 283.5 μL) in 0.5 mL of DMF was added a solution of NaSCH₂Ph (0.525 mmol, 76.7 mg) in 0.5 ml DMF and the mixture was allowed to stir for 60 h. The reaction mixture was then filtered and a methanolic solution of Cu(OAc)₂·2H₂O (0.525 mmol, 114.3 mg) was added into the reaction mixture and further allowed to stir for 12 h which resulted into the precipitation of characteristic brown-black solid of CuS. The solid was allowed to settle down, and filtered. The brown-black solid was then washed several times with DMF followed by Et₂O and dried in vacuum to afford CuS (42.6 mg, 84.8%, 29.7 equivs.).
