

Supplementary Figure S10

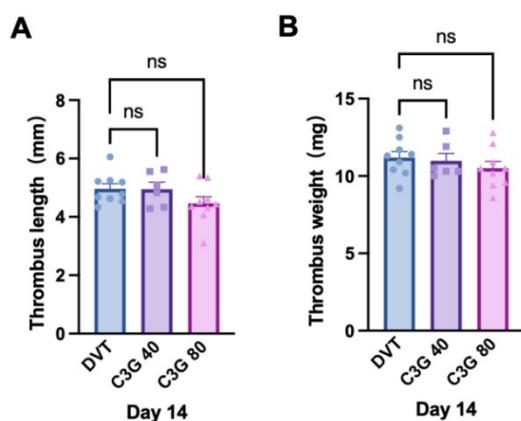

Figure S10 Effects of C3G on thrombus length and weight under therapeutic administration.

Thrombus length (A) and thrombus weight (B) were evaluated on day 14 after inferior vena cava (IVC) ligation. C3G was administered therapeutically starting on the day of IVC ligation and continued until day 14 in the C3G (40 mg/kg) and C3G (80 mg/kg) groups, with the model (DVT) group serving as control. $n = 6-9$; ns, not significant.
