### ELECTRONIC SUPPORTING INFORMATION

#### FIGURE AND TABLE CAPTIONS

**Fig S1.** Flowsheet for single-reactor tandem aldol condensation – hydrogenation process.

**Fig S2.** Flowsheet for two-reactor aldol condensation – hydrogenation process.

**Fig S3.** Market price of PGM catalysts from April 2009 to April 2026 (adapted from ref<sup>S1</sup>). The asterisk (\*) indicates the minimum and maximum prices used for the sensitivity analysis to assess the effect of price fluctuation on the variable cost of THF-ALD-1.

**Fig S4.** Flowsheet for the process for preparing Pd/Al<sub>2</sub>O<sub>3</sub> catalyst.

**Fig S5.** Contributions to environmental impacts for the manufacture of THF-ALD-1.

**Fig S6.** Environmental impact of the Pd loading in Pd/Al<sub>2</sub>O<sub>3</sub> (from 5 wt% to 9 wt%).

**Fig S7.** Flowsheet for manufacturing FF from corn. Process adapted from ref<sup>S2</sup>.

**Fig S8.** Market price of FF, MIBK, H<sub>2</sub> and ethanol (Europe) from March 2018 to September 2025 (adapted from ref<sup>S3-S6</sup>). The asterisk (\*) indicates the minimum and maximum prices used for the sensitivity analysis to assess the effect of price fluctuation on the variable cost of THF-ALD-1.

**Fig S9.** Effect of the overall yield and MIBK/FF molar ratio on the FMC of THF-ALD-1 and breakdown of costs (variable, fixed, depreciation) for single-reactor. In parentheses, benefits of single-reactor compared to two-reactor process.

**Fig S10.** Breakdown of (A) FMC and (B) variable costs of THF-ALD-1 manufacture as a function of the number of regeneration cycles (C) of Pd/Al<sub>2</sub>O<sub>3</sub> for (1) single reactor and (2) two-reactor processes. Add error bars.

**Fig S11.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Non-Renewable Energy [NRE] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S12.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Land Use [Land Use] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S13.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Acidification Potential [AP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup>

percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S14.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Ozone Layer Depletion Potential [OLDP] for (left) single reactor and (right) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S15.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Photochemical Oxidation Creation Potential [POCP] for (left) single reactor and (right) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S16.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Human Toxicity [HTP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S17.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Freshwater Aquatic Ecotoxicity Potential [FAETP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S18.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Maritime Aquatic Ecotoxicity Potential [MAETP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S19.** Effect of the overall yield and MIBK/FF molar ratio on Abiotic Depletion Potential [ADP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S20.** Effect of the overall yield and MIBK/FF molar ratio on Human Toxicity [HTP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S21.** Effect of the overall yield and MIBK/FF molar ratio on Freshwater Aquatic Ecotoxicity Potential [FAETP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S22.** Effect of the overall yield and MIBK/FF molar ratio on Terrestrial Aquatic Ecotoxicity Potential [TETP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S23.** Effect of the overall yield and MIBK/FF molar ratio on Water Consumption [Water] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S24.** Effect of the overall yield and MIBK/FF molar ratio on Land [Land Use] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S25.** Effect of the overall yield and MIBK/FF molar ratio on Acidification Potential [AP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S26.** Effect of the overall yield and MIBK/FF molar ratio on Eutrophication Potential [EP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S27.** Uncertainty analysis for the single-reactor (green) and two-reactor (red) processes issued from Monte Carlo analysis unveiling the statistical significance of the average values measures for the different impact categories (base case).

**Fig S28.** Log-normal plot issued from Monte Carlo analysis for Climate Change [GWP 100a] comparing the single-reactor and two-step processes.

**Fig S29.** Log-normal plot issued from Monte Carlo analysis for Acidification [AP] comparing the single-reactor and two-step processes.

**Fig S30.** Log-normal plot issued from Monte Carlo analysis for Photochemical Oxidation [POCP] comparing the single-reactor and two-step processes.

**Fig S31.** Log-normal plot issued from Monte Carlo analysis for Freshwater Aquatic Ecotoxicity [FAETP] comparing the single-reactor and two-step processes.

**Fig S32.** Log-normal plot issued from Monte Carlo analysis for Terrestrial Aquatic Ecotoxicity [TETP] comparing the single-reactor and two-step processes.

**Table S1.** Physicochemical properties of the main chemicals for THF-ALD-1 manufacture in single-reactor and two-reactor process.

**Table S2.** Process inventory of FFDA production from FF and MIBK in single-reactor and two-step process. Calculations scaled for a production of 3,300 ton/year.

**Table S3.** Summary of process assumptions for the manufacture of THF-ALD-1 in single-reactor and two-reactor process.

**Table S4.** Key background datasets using in the LCI and corresponding Ecoinvent version.

**Table S5.** Revised Pd inventories (in blue). From these values, all impacts in Ecoinvent 3.4 were multiplied by 1.7 compared to the existing inventories\*

**Table S6.** Process inventory to produce 5wt%Pd/Al<sub>2</sub>O<sub>3</sub>.

**Table S7.** Environmental impacts for the manufacture of 5wt%Pd/Al<sub>2</sub>O<sub>3</sub> (computed using Ecoinvent database 3.4)

**Table S8.** Amount of Pd reused and cost as a function of the number of regeneration cycles (C) of Pd/Al<sub>2</sub>O<sub>3</sub> catalyst.

**Table S9.** Process inventory for the manufacture of FF.

**Table S10.** Pedigree matrix with the scores used to assess the quality of data sources (readapted from ref.<sup>S9</sup>).

**Table S11.** Scores used for the Pedigree matrix to assess the quality of data sources for two-step and single-reactor processes (derived from ref.<sup>S7</sup>).

**Table S12.** Breakdown of fixed and variable (base case) costs, and depreciation and discounted flow analysis for single-reactor and two-reactor processes.

**Table S13.** Sensitivity analysis for the FMC of THF-ALD-1 as a function of the number of regeneration cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst, overall yield (Y) and MIBK/FF molar ratio (R) in the single-reactor process. Costs given in €/ton.

**Table S14.** Sensitivity analysis for the FMC of THF-ALD-1 as a function of the number of regeneration cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst, the overall yield (Y) and MIBK/FF molar ratio (R) in the two-reactor process. Costs given in €/ton

**Table S15.** Sensitivity analysis on the benefits of single-reactor towards two-reactor process for the FMC of THF-ALD-1 as a function of the number of regeneration cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst, the overall yield (Y) and MIBK/FF molar ratio (R). Costs given in €/ton

**Table S16.** Breakdown for Non-Renewable Energy [NRE] (in MJ) for single-reactor and two-reactor processes.

**Table S17.** Sensitivity analysis for the different impact categories for THF-ALD-1 manufacture as a function of the number of recycling cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst (C), overall yield (Y) and MIBK/FF molar ratio (R) in the single-reactor process.

**Table S18.** Sensitivity analysis for the different impact categories for THF-ALD-1 manufacture as a function of the of the number of recycling cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst (C), overall yield (Y) and MIBK/FF molar ratio (R) in the two-reactor process.

**Table S19.** Sensitivity analysis on the benefits of single-reactor towards two-reactor process for the different impact categories for THF-ALD-1 manufacture as a function of the number of recycling cycles of the Pd/Al<sub>2</sub>O<sub>3</sub> catalyst (C), overall yield (Y) and MIBK/FF molar ratio (R).

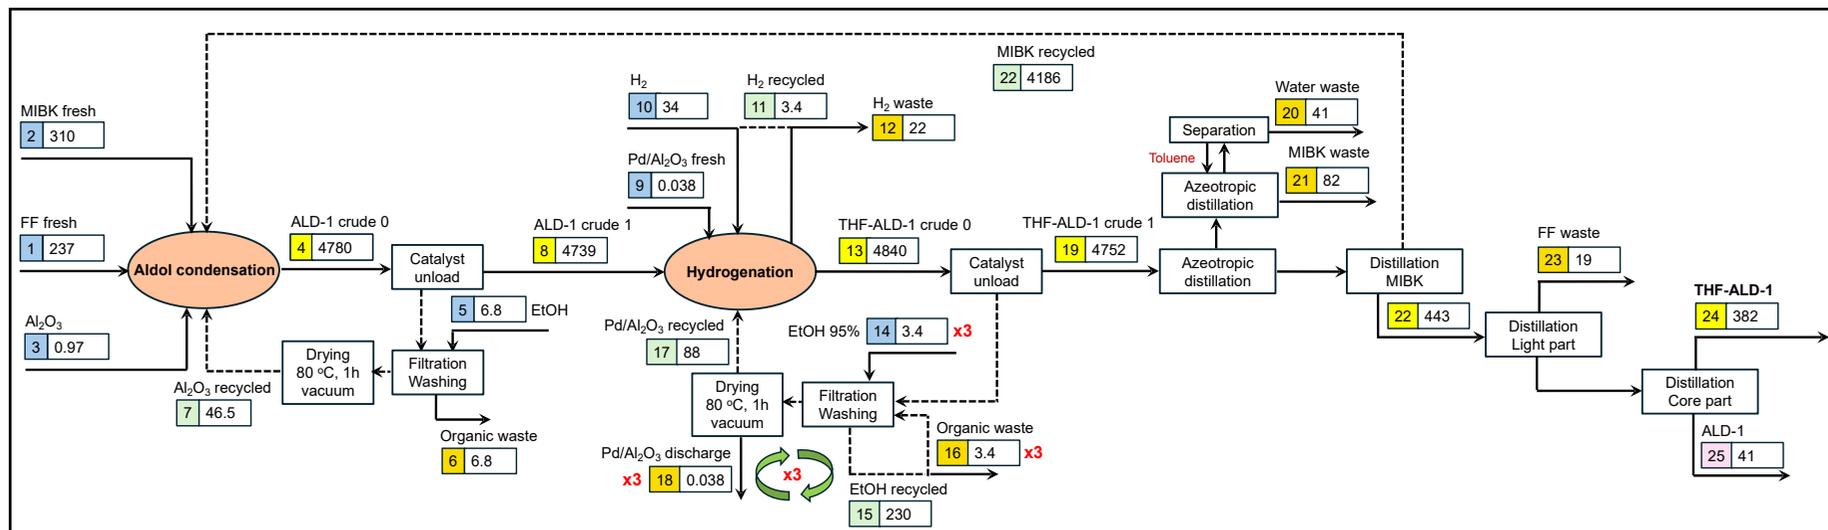

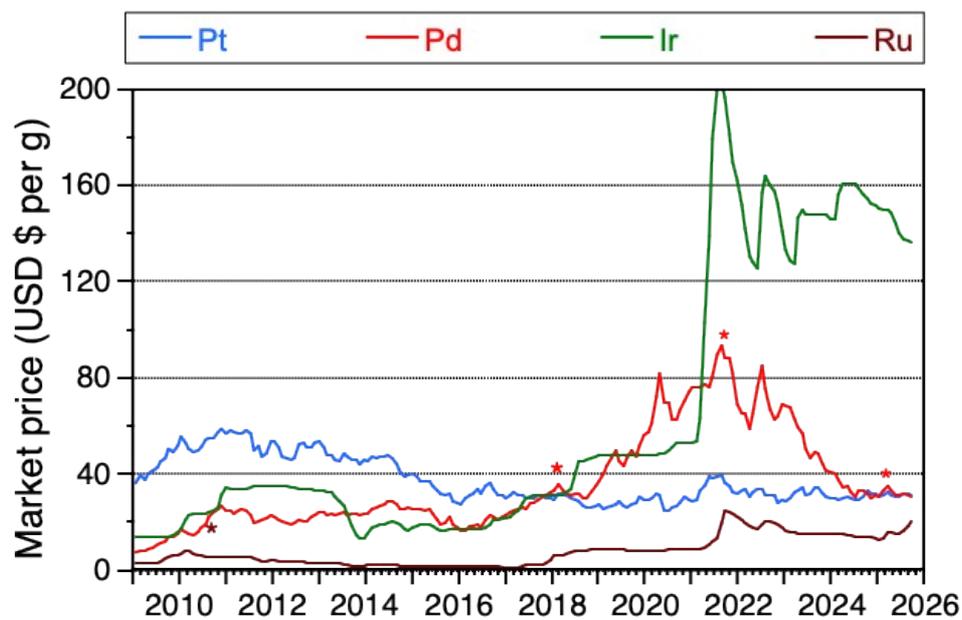

Fig S2. Flowsheet for two-reactor aldol condensation – hydrogenation process.

**Fig S3.** Market price of PGM catalysts from April 2009 to April 2026 (adapted from ref<sup>S1</sup>). The asterisk (\*) indicates the minimum and maximum prices used for the sensitivity analysis to assess the effect of price fluctuation on the variable cost of THF-ALD-1.

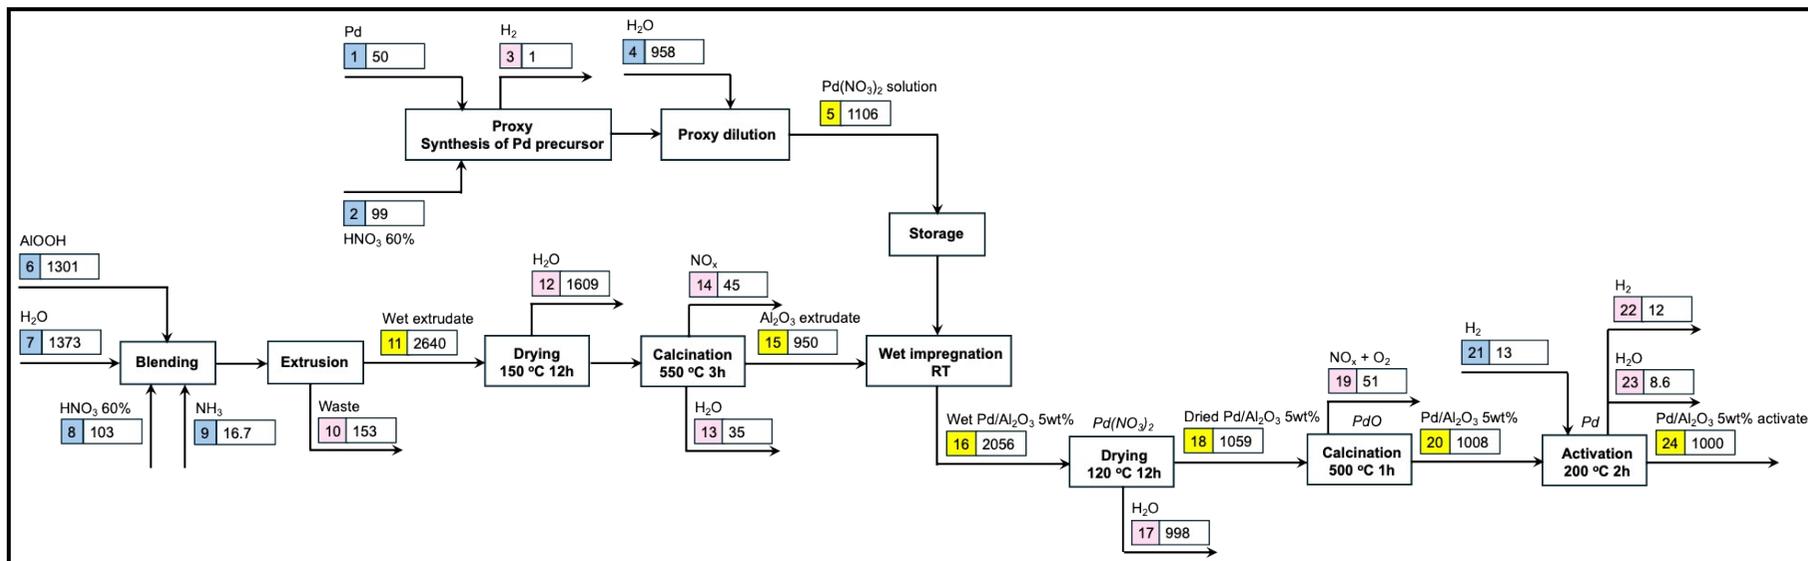

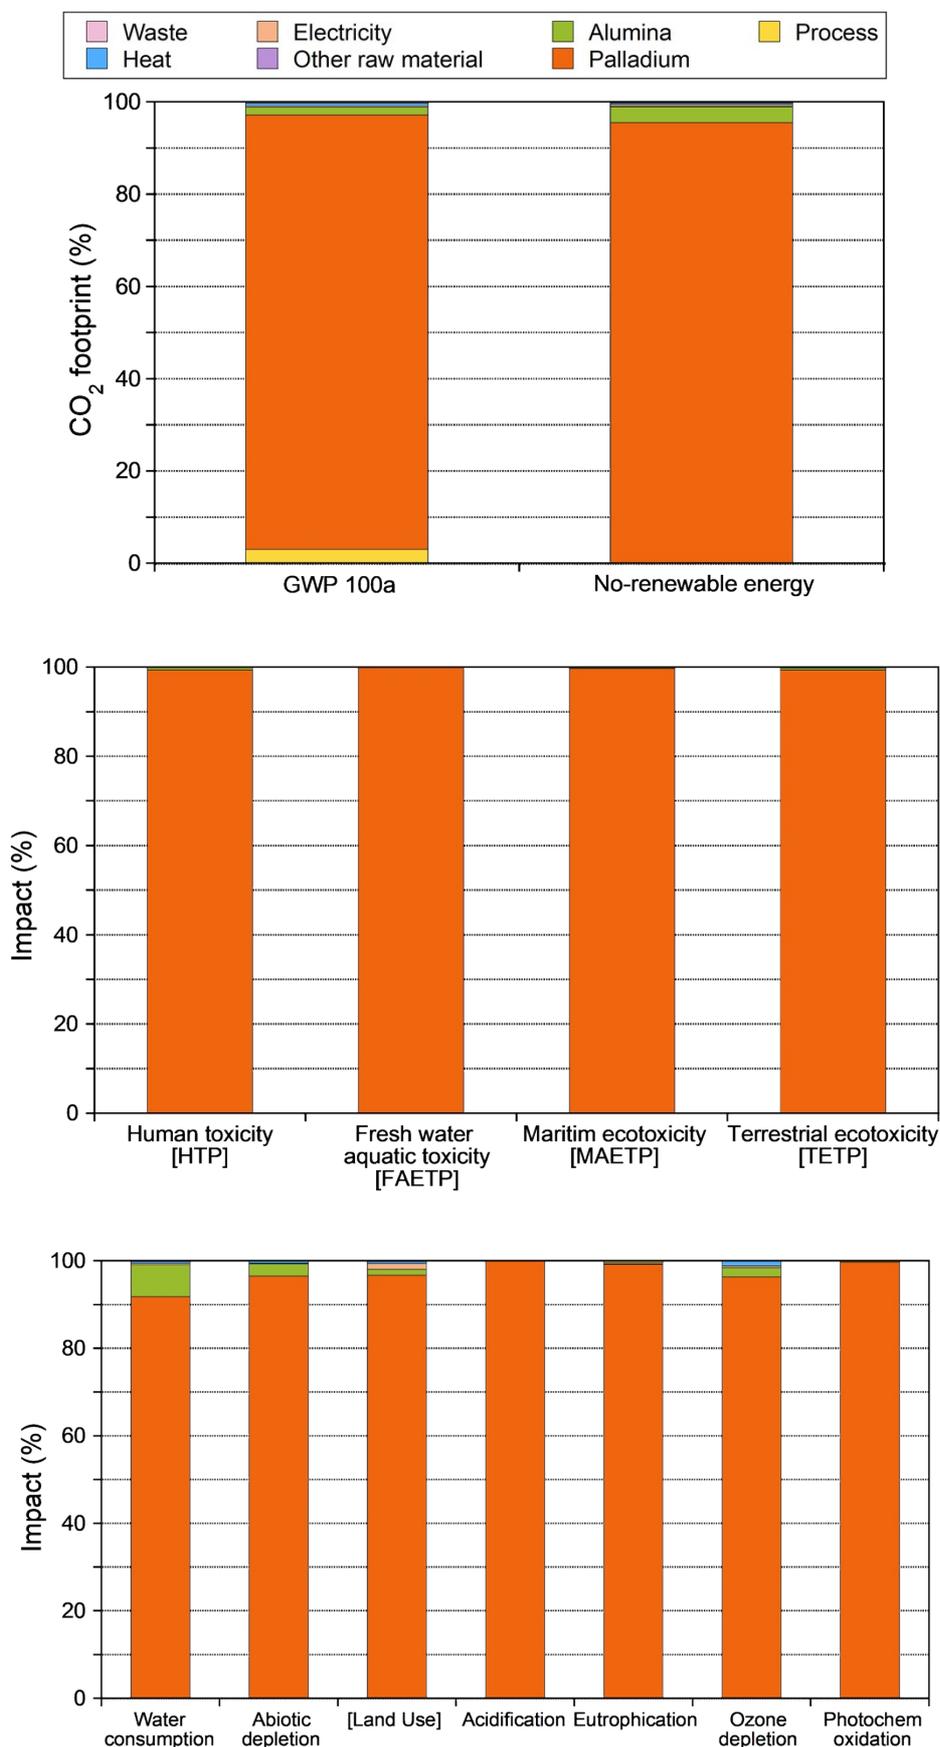

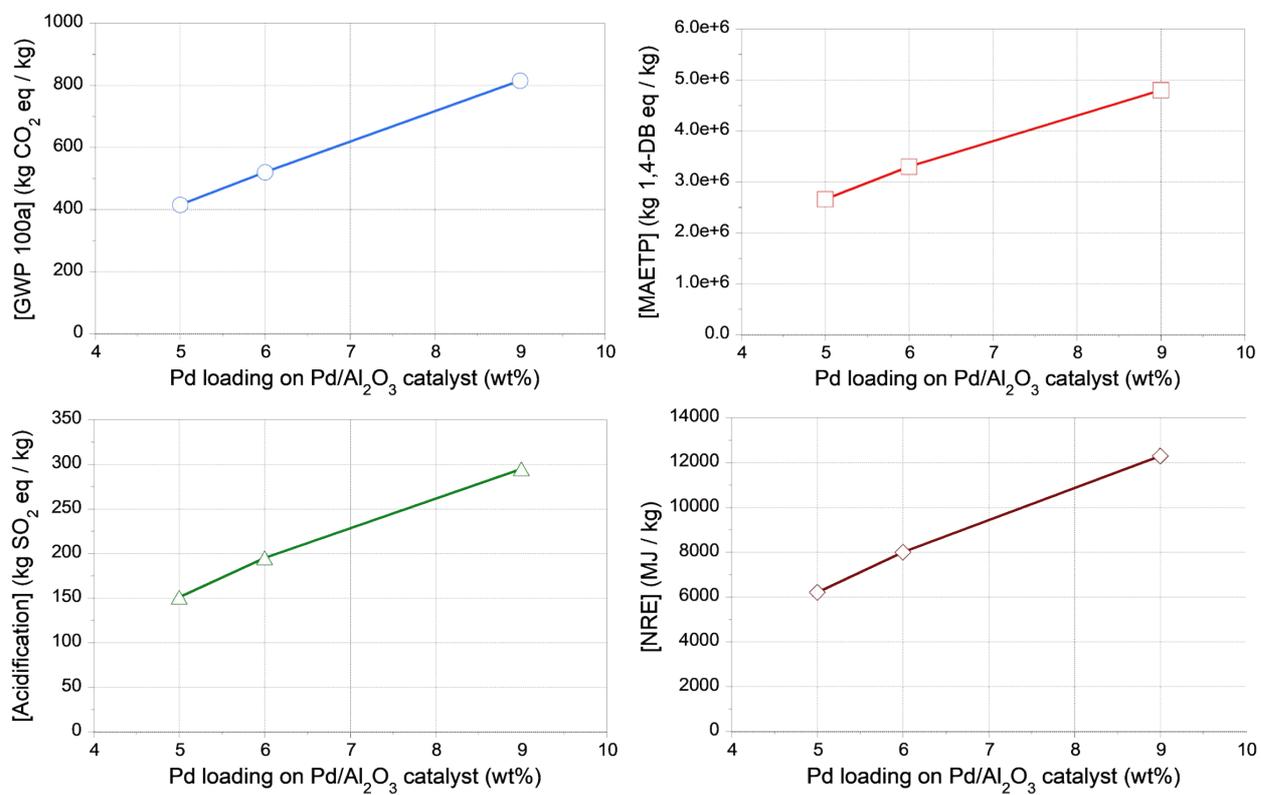

Fig S4. Flowsheet for the process for preparing Pd/Al<sub>2</sub>O<sub>3</sub> catalyst.

**Fig S5.** Contributions to environmental impacts for the manufacture of THF-ALD-1.

**Fig S6.** Environmental impact of the Pd loading in Pd/Al<sub>2</sub>O<sub>3</sub> (from 5 wt% to 9 wt%).

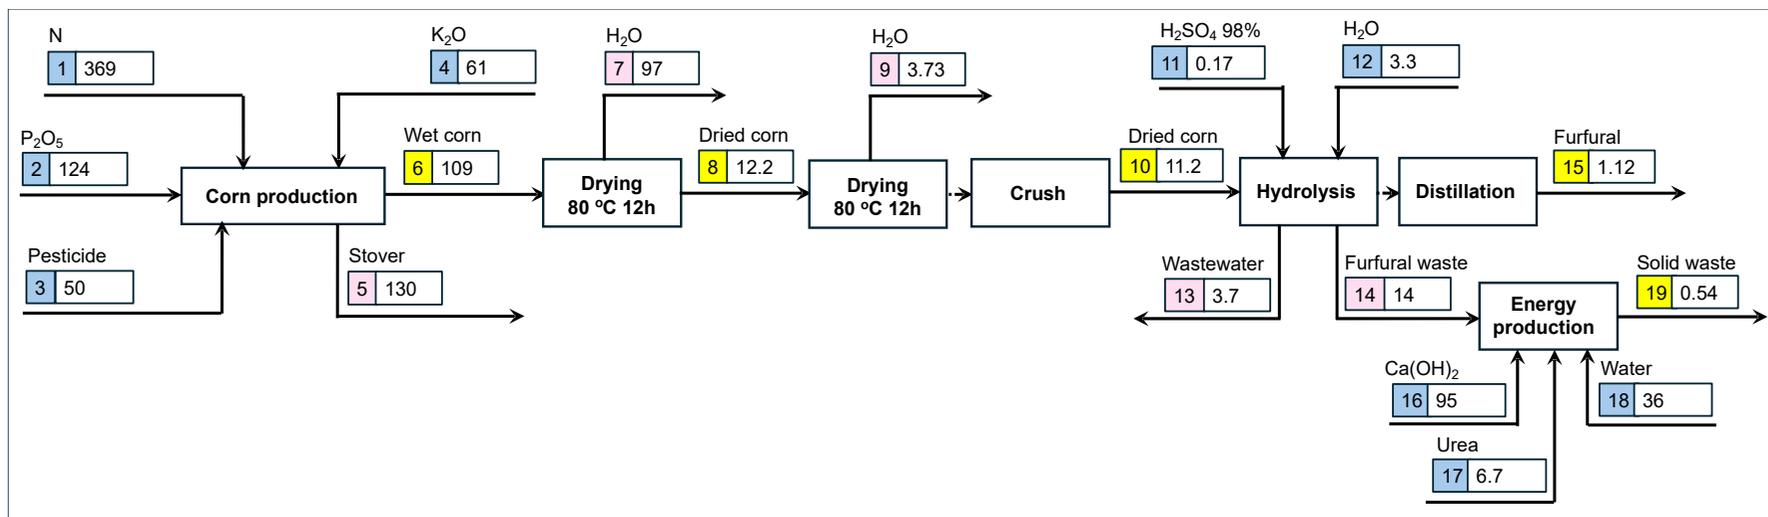

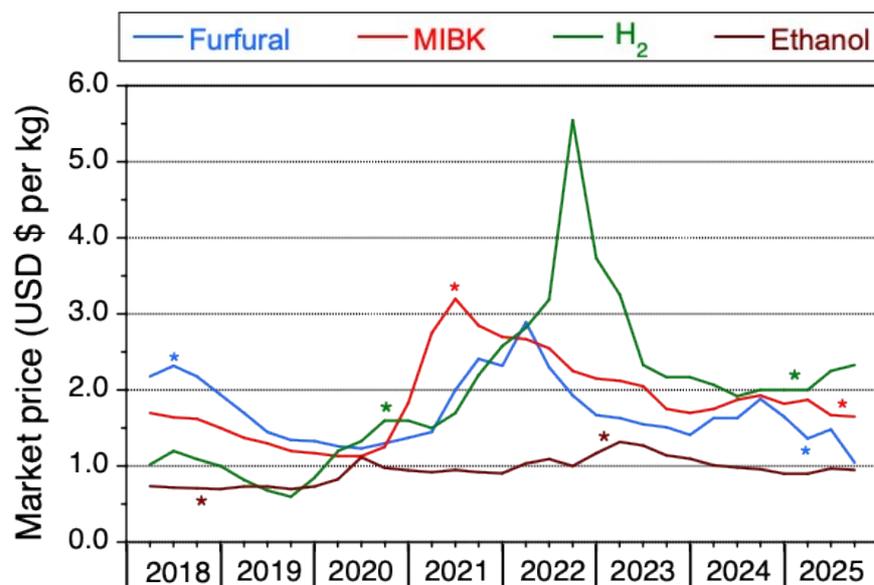

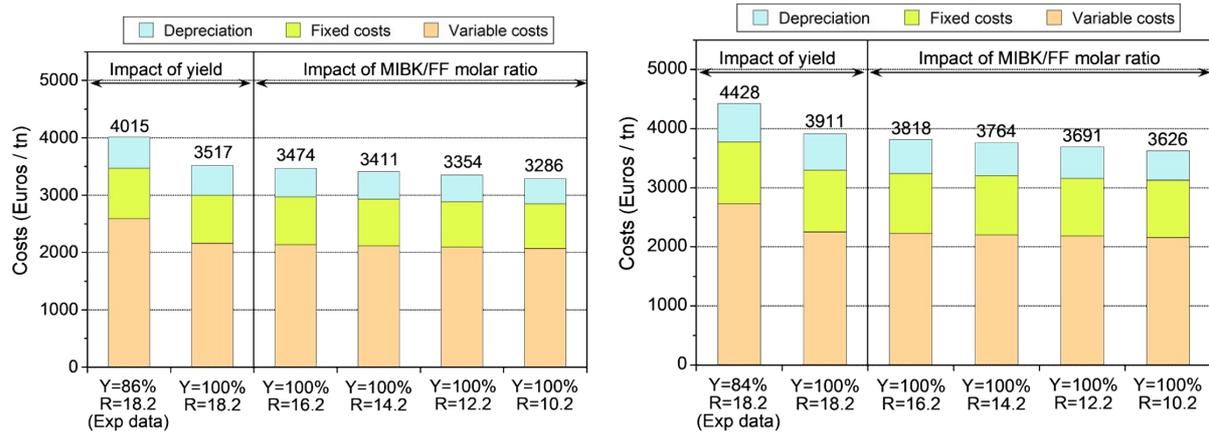

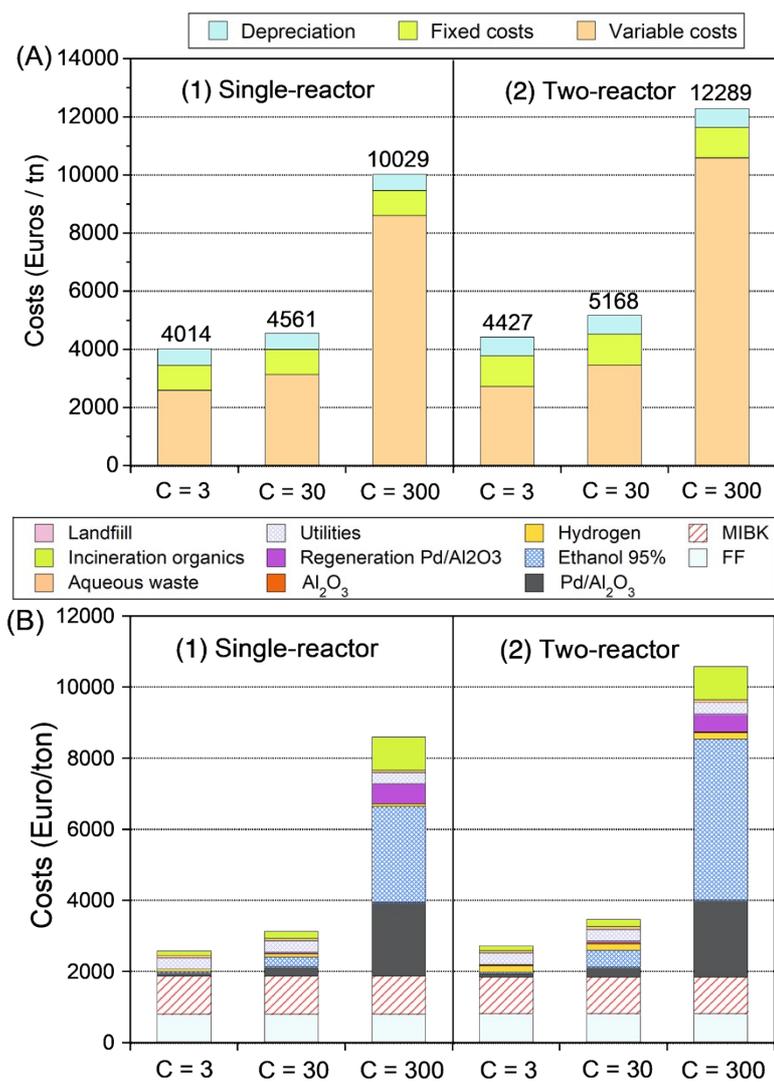

Fig S7. Flowsheet for manufacturing FF from corn. Process adapted from ref<sup>S2</sup>.

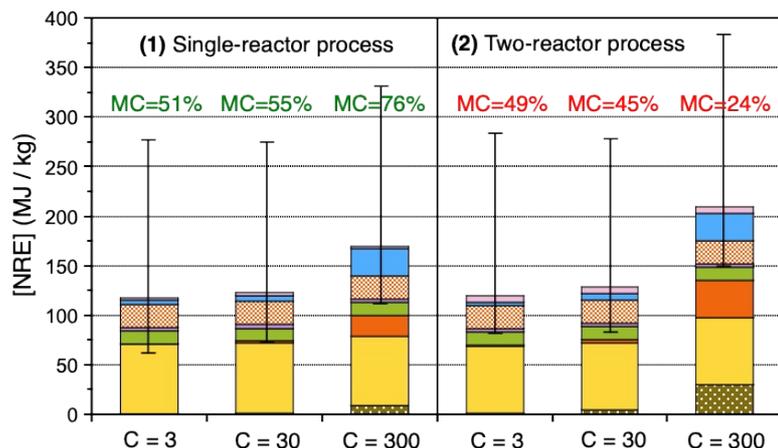

**Fig S8.** Market price of FF, MIBK, H<sub>2</sub> and ethanol (Europe) from March 2018 to September 2025 (adapted from ref<sup>S3-S6</sup>). The asterisk (\*) indicates the minimum and maximum prices used for the sensitivity analysis to assess the effect of price fluctuation on the variable cost of THF-ALD-1.

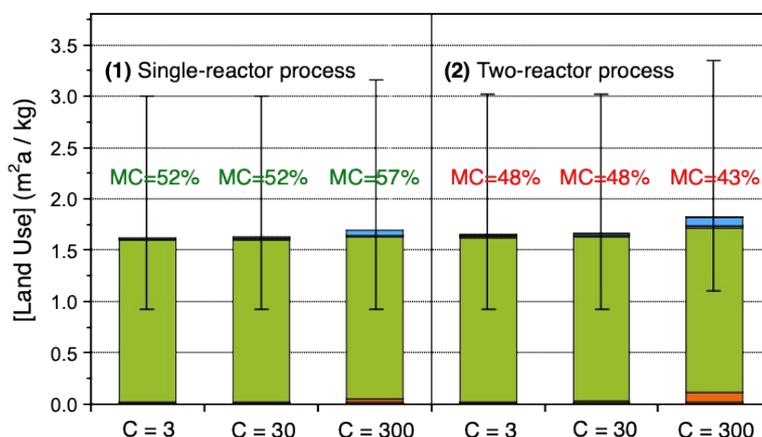

**Fig S9.** Effect of the overall yield and MIBK/FF molar ratio on the FMC of THF-ALD-1 and breakdown of costs (variable, fixed, depreciation) for single-reactor. In parentheses, benefits of single-reactor compared to two-reactor process.

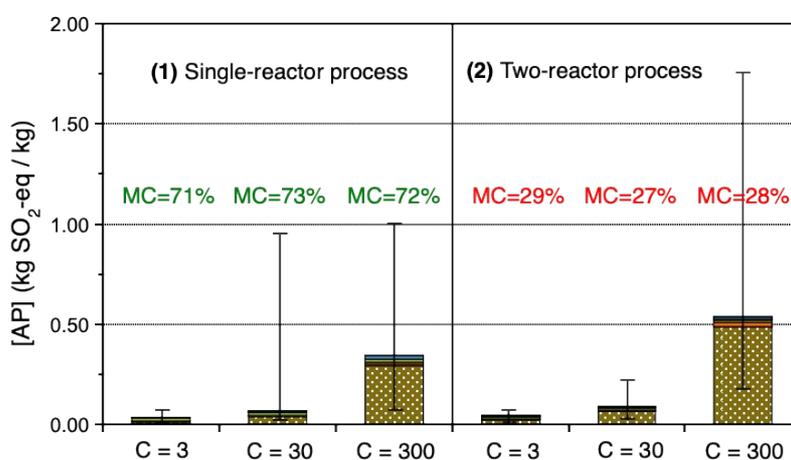

**Fig S10.** Breakdown of (A) FMC and (B) variable costs of THF-ALD-1 manufacture as a function of the number of regeneration cycles (C) of Pd/Al<sub>2</sub>O<sub>3</sub> for (1) single reactor and (2) two-reactor processes. Add error bars.

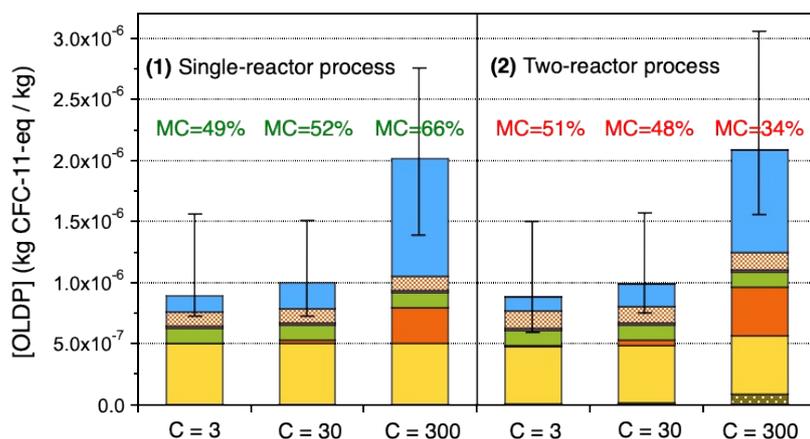

**Fig S11.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Non-Renewable Energy [NRE] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

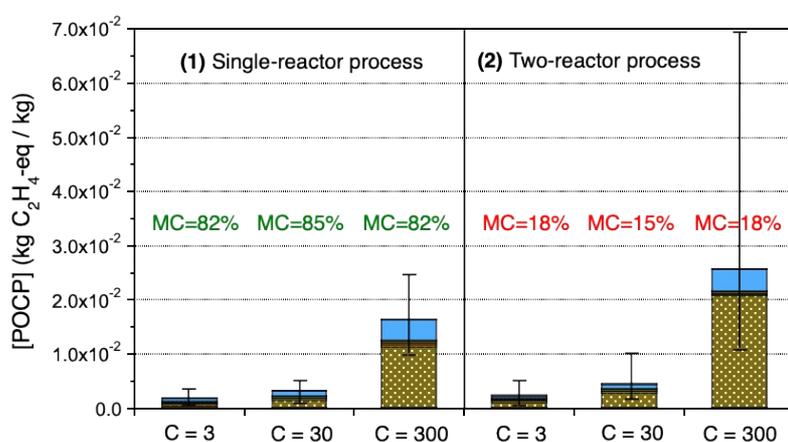

**Fig S12.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Land Use [Land Use] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

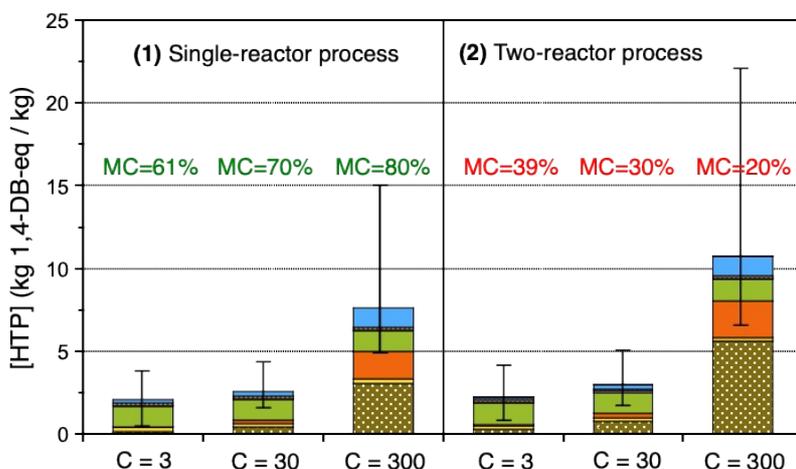

**Fig S13.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Acidification Potential [AP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

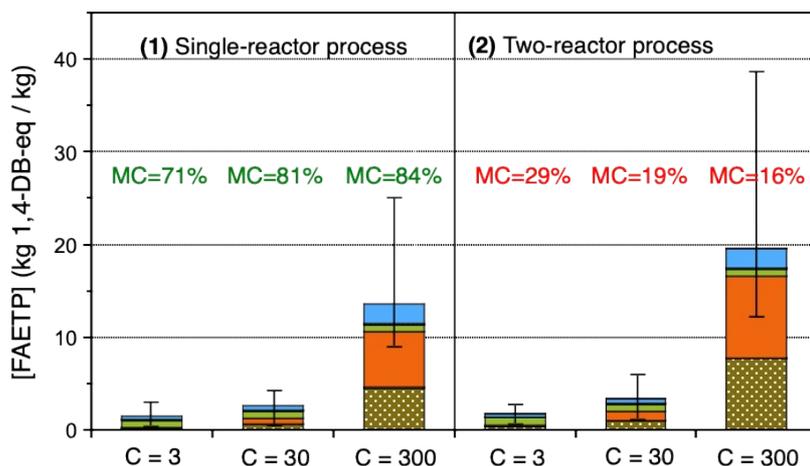

**Fig S14.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Ozone Layer Depletion Potential [OLDP] for (left) single reactor and (right) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

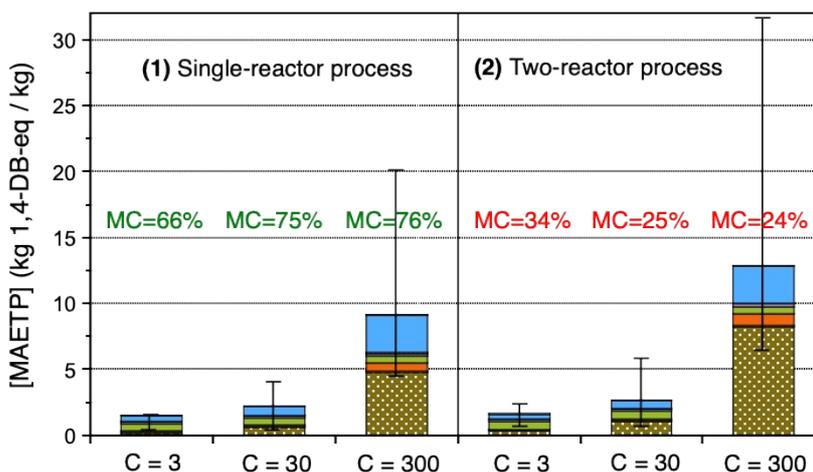

**Fig S15.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Photochemical Oxidation Creation Potential [POCP] for (left) single reactor and (right) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

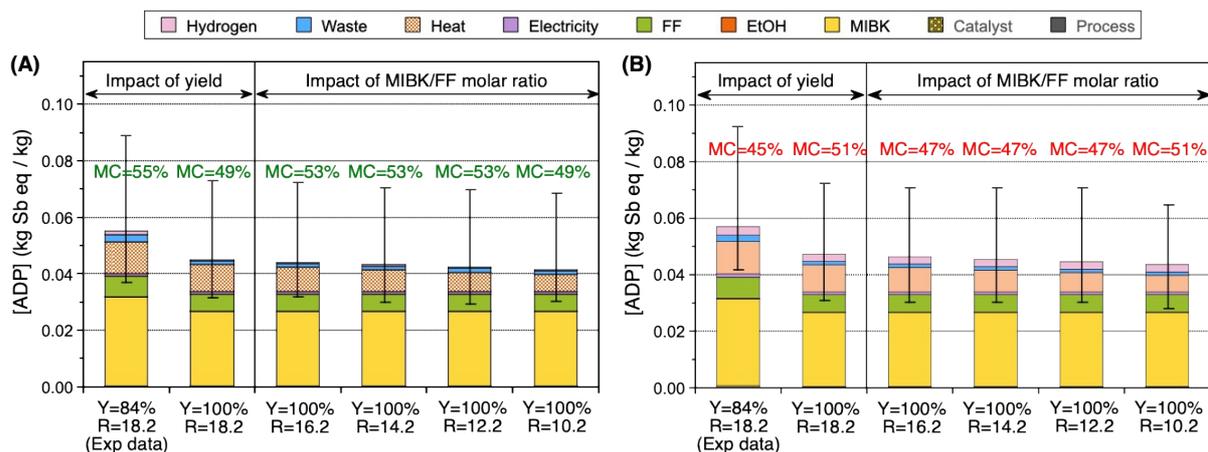

**Fig S16.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Human Toxicity [HTP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

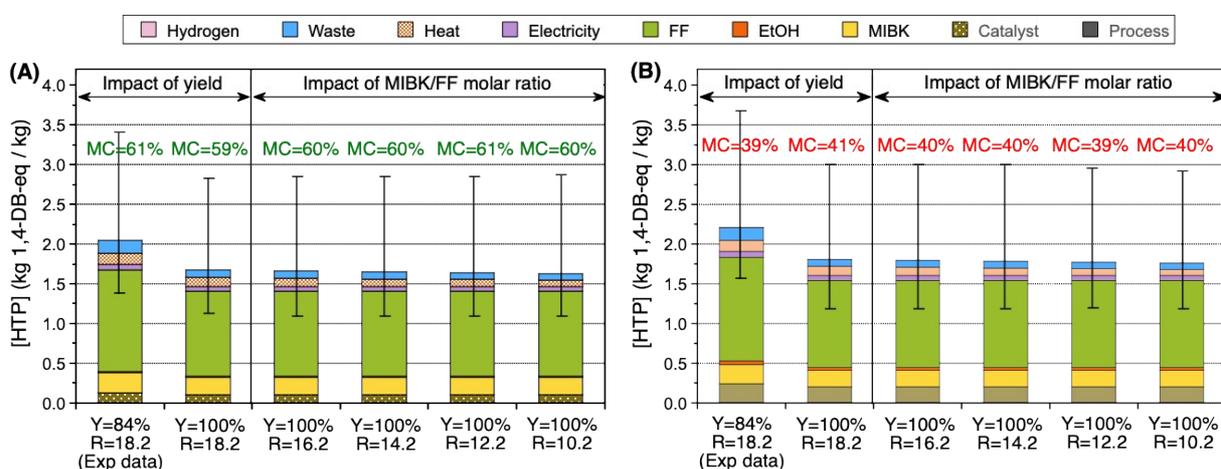

**Fig S17.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Freshwater Aquatic Ecotoxicity Potential [FAETP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

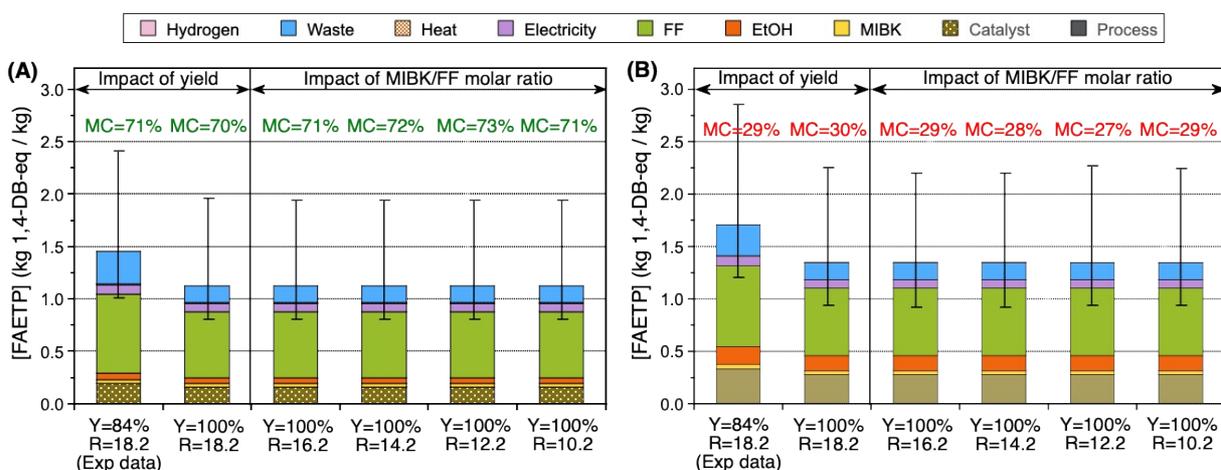

**Fig S18.** Effect of the number of regeneration cycles for Pd/Al<sub>2</sub>O<sub>3</sub> catalyst on Maritime Aquatic Ecotoxicity Potential [MAETP] for (1) single reactor and (2) two-reactor processes. The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

**Fig S19.** Effect of the overall yield and MIBK/FF molar ratio on Abiotic Depletion Potential [ADP] for (1) single-reactor and (2) two-reactor processes ( $C=3$ ). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

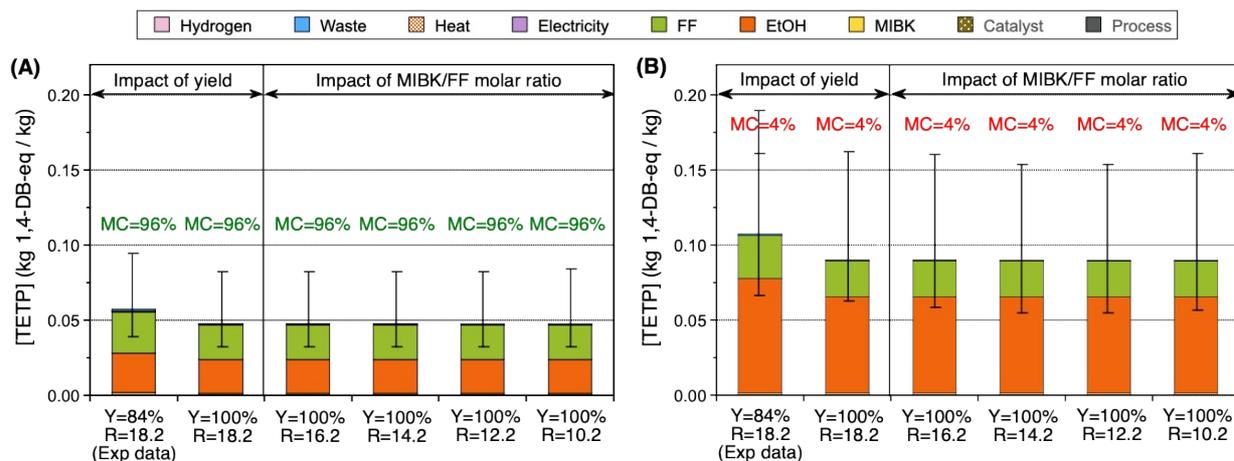

**Fig S20.** Effect of the overall yield and MIBK/FF molar ratio on Human Toxicity [HTP] for (1) single-reactor and (2) two-reactor processes ( $C=3$ ). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

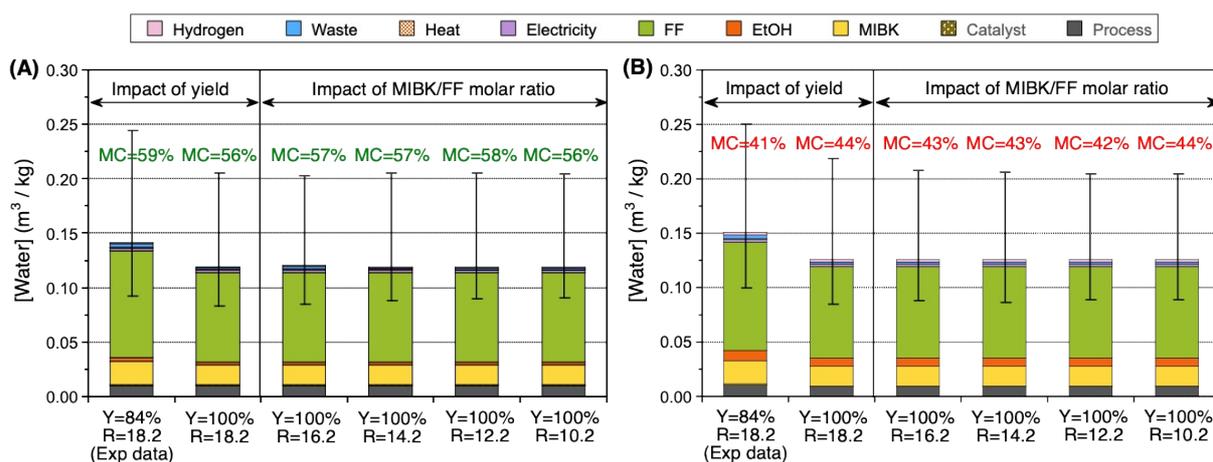

**Fig S21.** Effect of the overall yield and MIBK/FF molar ratio on Freshwater Aquatic Ecotoxicity Potential [FAETP] for (1) single-reactor and (2) two-reactor processes ( $C=3$ ). The error bars were measured as the

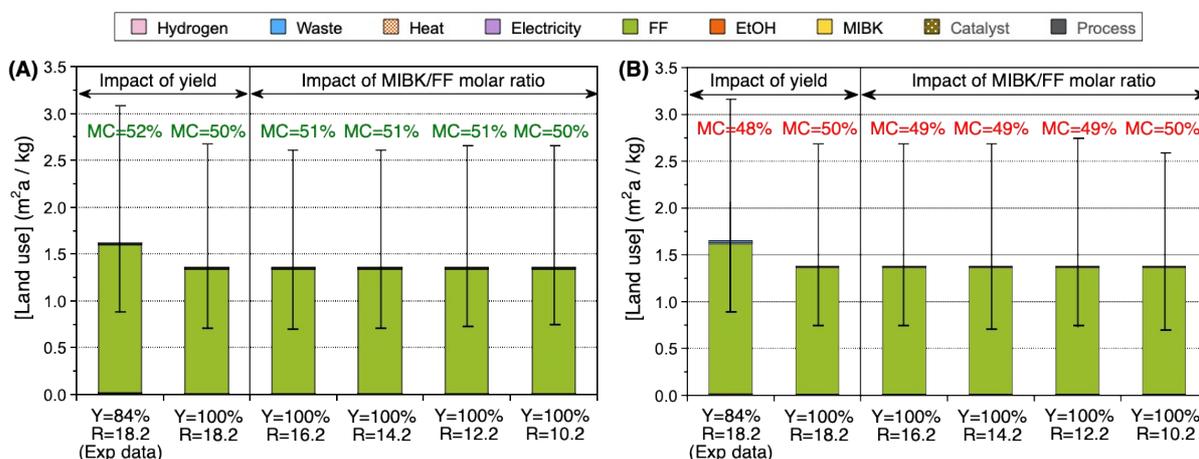

2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

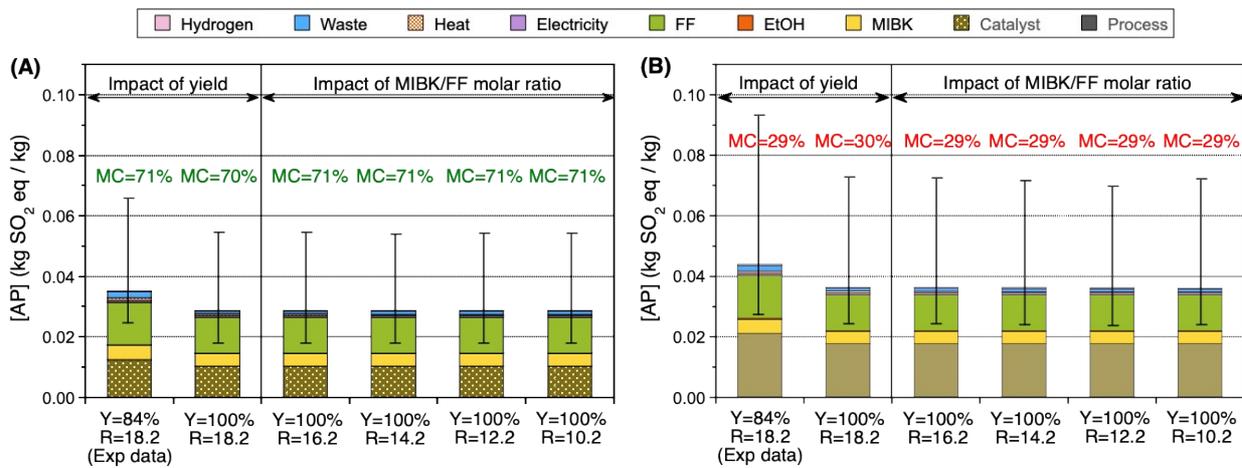

**Fig S22.** Effect of the overall yield and MIBK/FF molar ratio on Terrestrial Ecotoxicity Potential [TETP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

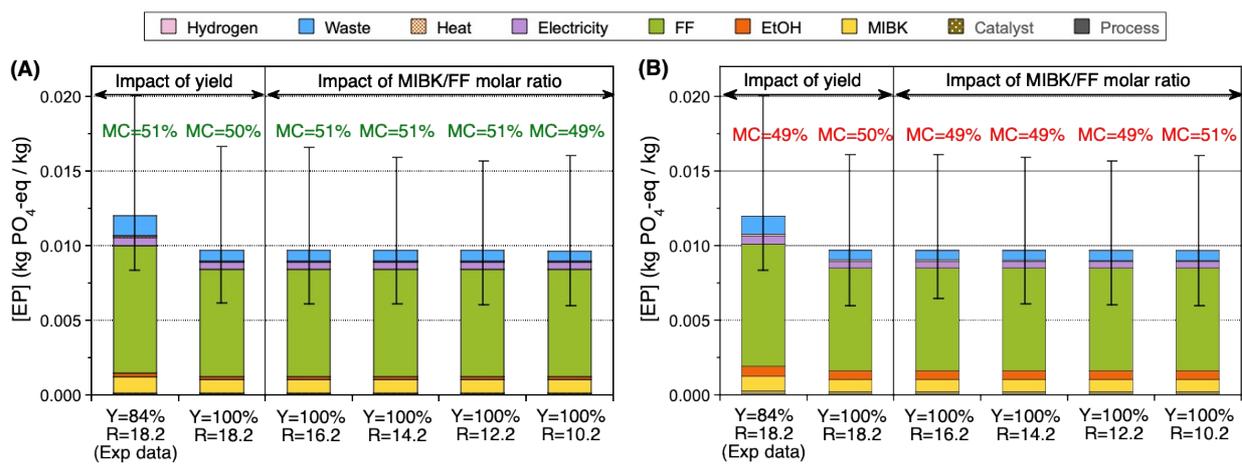

**Fig S23.** Effect of the overall yield and MIBK/FF molar ratio on Water Consumption [Water] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

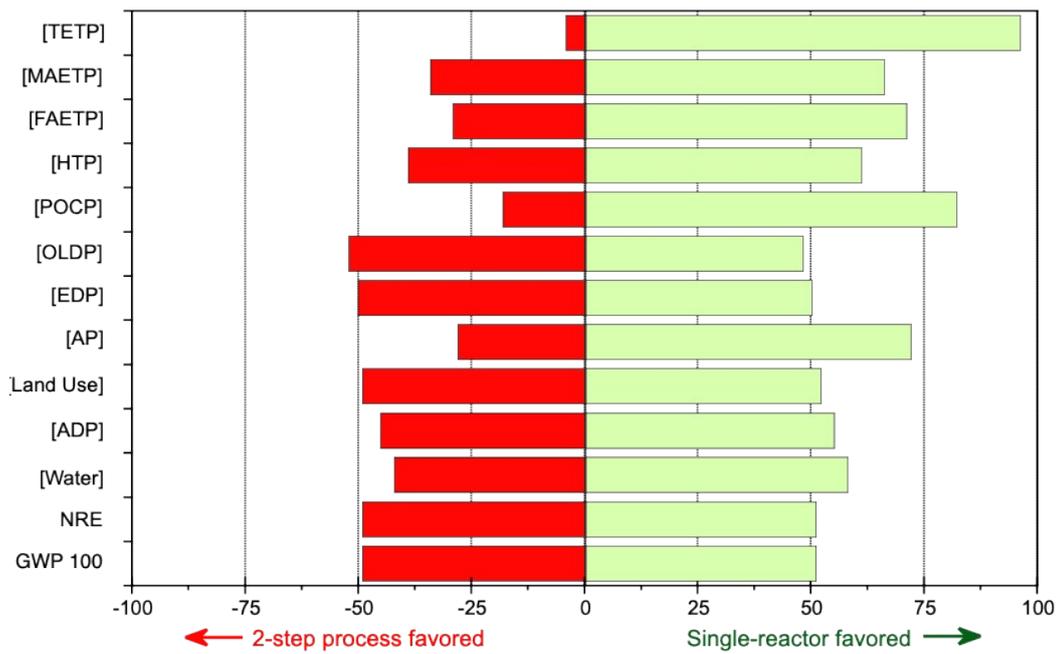

**Fig S24.** Effect of the overall yield and MIBK/FF molar ratio on Land [Land Use] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

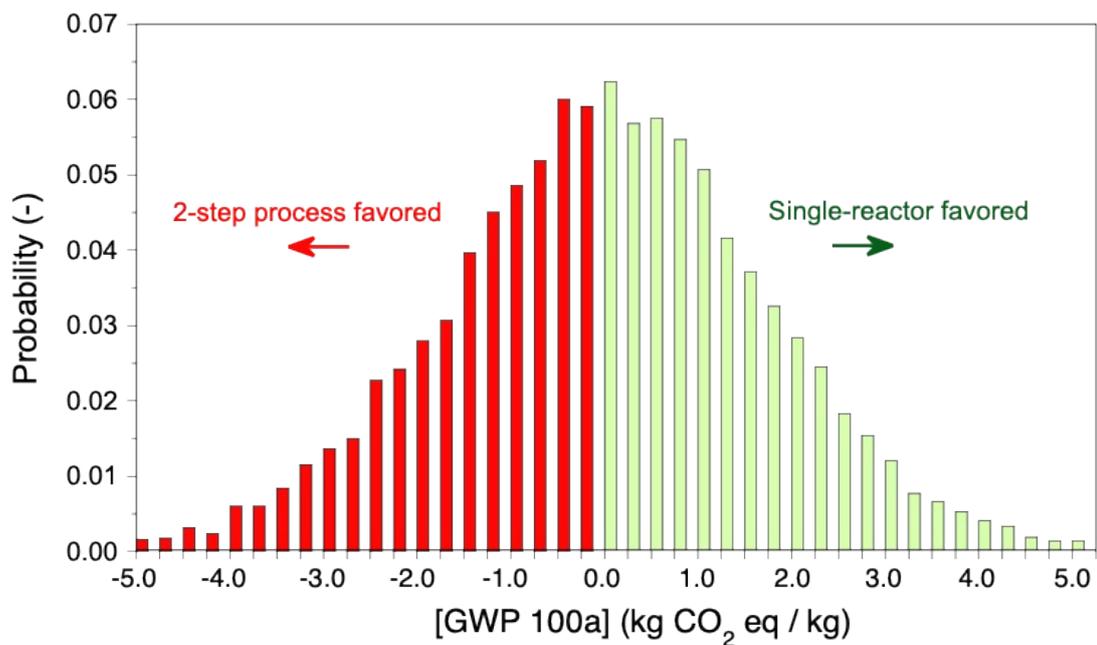

**Fig S25.** Effect of the overall yield and MIBK/FF molar ratio on Acidification Potential [AP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

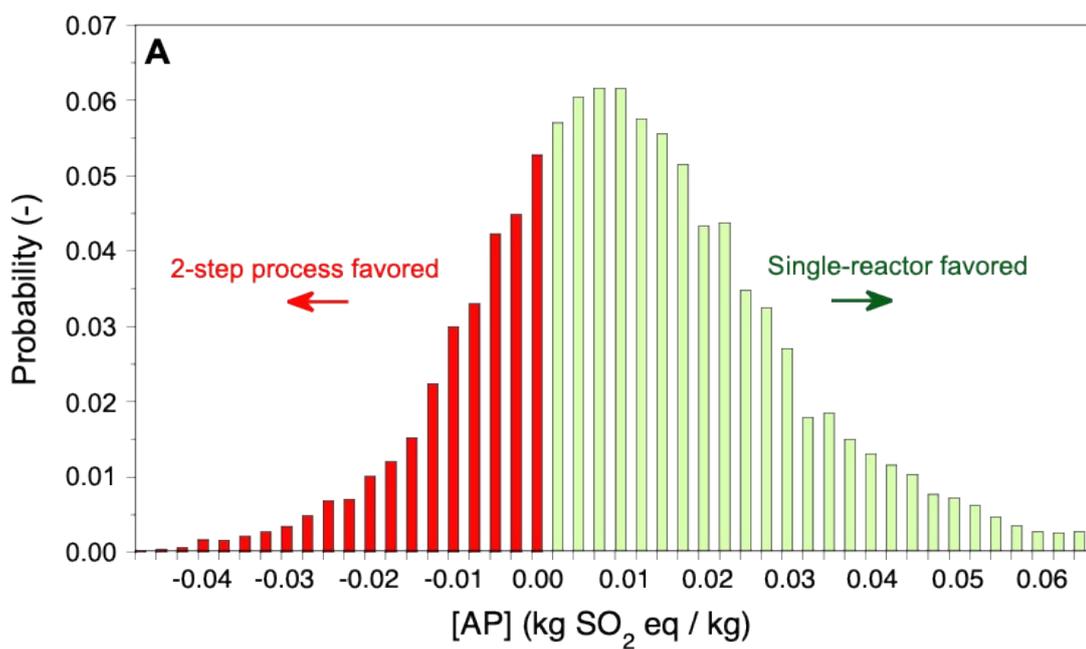

**Fig S26.** Effect of the overall yield and MIBK/FF molar ratio on Eutrophication Potential [EP] for (1) single-reactor and (2) two-reactor processes (C=3). The error bars were measured as the 2.5<sup>th</sup> and 97.5<sup>th</sup> percentiles (95% confidence interval). The number on top of the bars indicate the percentage of MC calculations favouring either the single-reactor or two-reactor scenarios.

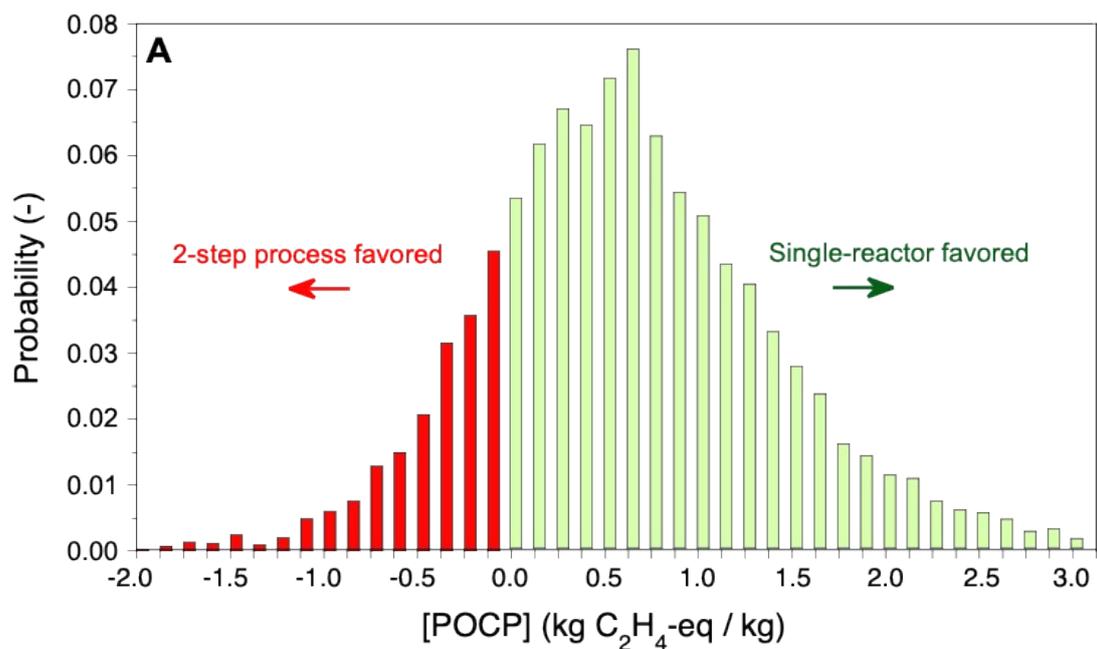

**Fig S27.** Uncertainty analysis for the single-reactor (green) and two-reactor (red)-processes issued from Monte Carlo analysis unveiling the statistical significance of the average values measures for the different impact categories (base case).

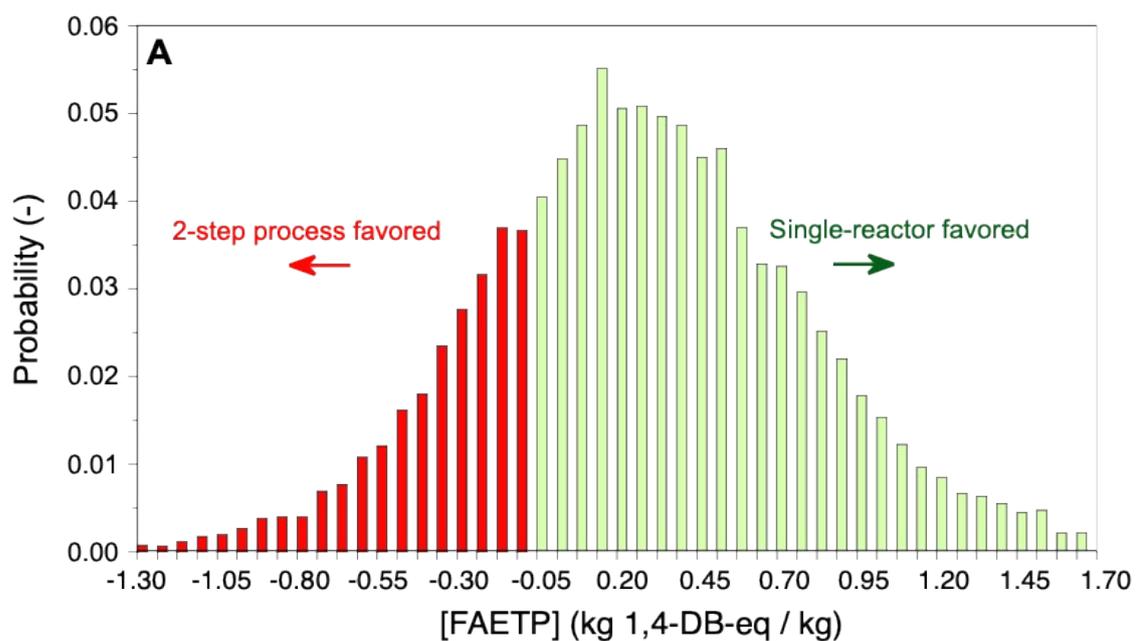

**Fig S28.** Log-normal plot issued from Monte Carlo analysis for Climate Change [GWP 100a] comparing the single-reactor and two-step processes.

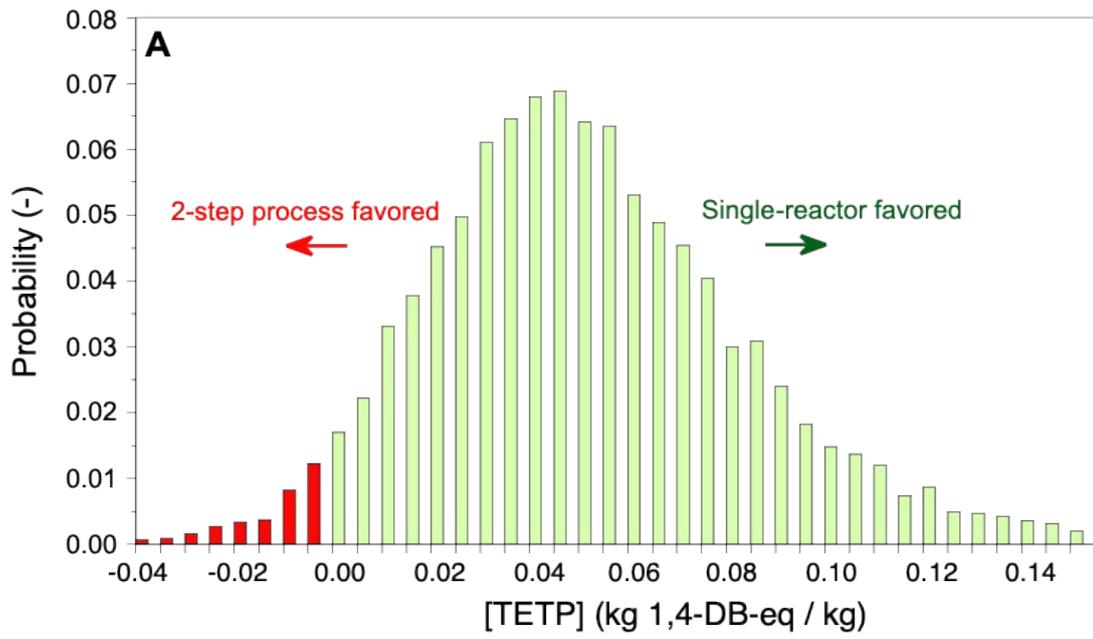

**Fig S29.** Log-normal plot issued from Monte Carlo analysis for Acidification [AP] comparing the single-reactor and two-step processes.

**Fig S30.** Log-normal plot issued from Monte Carlo analysis for Photochemical Oxidation [POCP] comparing the single-reactor and two-step processes.

**Fig S31.** Log-normal plot issued from Monte Carlo analysis for Freshwater Aquatic Ecotoxicity [FAETP] comparing the single-reactor and two-step processes.

**Fig S32.** Log-normal plot issued from Monte Carlo analysis for Terrestrial Aquatic Ecotoxicity [TETP] comparing the single-reactor and two-step processes.

**Table S1.** Physicochemical properties of the main chemicals for THF-ALD-1 manufacture in single-reactor and two-reactor process

<b>Chemical</b>	<b>Specific heat (J.g<sup>-1</sup>.°C<sup>-1</sup>)<sup>*</sup></b>	<b>Enthalpy of vapor. (kJ/kg)<sup>**</sup></b>	<b>Boiling T (°C)</b>	<b>Density (g.cm<sup>-3</sup>)</b>	<b>M<sub>w</sub> (g.mol<sup>-1</sup>)</b>
FF	1.15	365.0	161.7	1.16	96.09
MIBK	2.15	331.0	116.2	0.802	100.18
ALD-1	1.11	204.5	96.5	-	178.20
ALD-2	0.726	279.3	471.8	-	278.40
THF-ALD-1	1.88	279.5	263.8	-	184.30
THF-ALD-2	1.26	265.0	463.9	-	282.40
Toluene	1.70	360.7	110.6	0.87	92.14
Ethanol	2.44	838.0	78.3	0.79	46.07
Water	4.18	2257	100.0	0.99	18.01

<sup>\*</sup> Values at 20 °C; <sup>\*\*</sup> Values at boiling point

**Table S2.** Process inventory of FFDA production from FF and MIBK in single-reactor and two-step process. Calculations scaled for a production of 3,300 ton/year

Inventory	Items and their unit	Single-reactor process		Two-reactor process	
		UF**	Variable cost (€/ton)	UF**	Variable cost (€/ton)
<b>Raw Materials</b>	FF	0.618	804	0.629	817
	MIBK	0.859	1074	0.822	1028
	H <sub>2</sub>	0.039	78	0.091	182
	Ethanol 95%	0.0090x3	27	0.0270x3	45
<b>Catalysts</b>	Al <sub>2</sub> O <sub>3</sub>	-	-	0.00258	23
	Pd/Al <sub>2</sub> O <sub>3</sub>	0.00009	87	0.00010	94
<b>Utilities</b>	Steam	10.1	252	10.7	268
	Electricity	0.41	32	0.41	33
	Cooling water	512	26	544	27
	Process water	-	-	-	-
<b>Waste</b>	Total aqueous waste	0.108	76	0.110	77
	Total incineration waste	0.412	130	0.403	121
	Total landfill	0.0000279	0	0.0001652	0.1
<b>Catalyst regeneration</b>	Al <sub>2</sub> O <sub>3</sub>	-	-	-	-
	Pd/Al <sub>2</sub> O <sub>3</sub> (3 cycles / year)	0.000279	5.6	0.000242	5.0
<b>TOTAL COSTS</b>			<b>2591</b>		<b>2726</b>

\* Unit cost expressed in €/ton for raw materials, catalysts, and catalyst regeneration and steam, €/MWh for electricity, and €/m<sup>3</sup> for cooling and process water

\*\* UF (usage factor) = quantity of material / utility per 1 ton of finished good – Electricity in MWh – water in m<sup>3</sup> – all other materials and steam in ton

**Table S3.** Summary of process assumptions for the manufacture of THF-ALD-1 in single-reactor and two-reactor process

Process	Single-reactor process			Two-step process		
<b>Aldol condensation</b>						
Ratio MIBK / FF (mol/mol)	18.2			18.2		
Ratio (Pd)Al <sub>2</sub> O <sub>3</sub> /FF (w:w)	20%			20%		
Time / T / P	3 h	180 °C	5.0 bar	3 h	180 °C	5.0 bar
FF conversion	92%			93%		
ALD-1 / ALD-2 selectivity	100%	0%		92.5%	7.5%	
<b>Hydrogenation</b>						
Excess H <sub>2</sub> (mol)	1.10			1.10		
Ratio Pd/Al <sub>2</sub> O <sub>3</sub> / FFAD (w:w)	20%			0%		
Ratio Pd/Al <sub>2</sub> O <sub>3</sub> / FF (w:w)	37%			0%		
Time / T / P	3 h	180 °C	20 bar	6 h	180 °C	20 bar
ALD-1 conversion	92%			93%		
THF-ALD-1 / THF-ALD-2 selectivity	100%	0%		100%	100%	
<b>H<sub>2</sub> recycling loop (purge + compression)</b>						
Ratio purge H <sub>2</sub> wt%	100%			100%		
Initial conditions		25 °C	20 bar		25 °C	20 bar
Time / T / P recompression	0.5 h	25 °C	1 bar	0.5 h	25 °C	1 bar
<b>Regeneration catalyst 1</b>						
Loss Al <sub>2</sub> O <sub>3</sub> per in mass media	2.0%			-		
Loss Al <sub>2</sub> O <sub>3</sub> per regeneration	0.050%			-		
Ratio EtOH / (Pd)Al <sub>2</sub> O <sub>3</sub>	5			-		
# washings EtOH	1			-		
# of cycles Al <sub>2</sub> O <sub>3</sub> before regeneration	3			-		
Initial conditions		25 °C	1 bar		-	-
Time / T / P recompression	1 h	25 °C	1 bar	-	-	-
<b>Regeneration catalyst 2</b>						
Loss Al <sub>2</sub> O <sub>3</sub> per in mass media	0.05%			0.05%		
Loss Al <sub>2</sub> O <sub>3</sub> per regeneration	0.0050%			0.0050%		
Ratio EtOH / (Pd)Al <sub>2</sub> O <sub>3</sub>	5			5		
# washings EtOH	1			1		
# of cycles Al <sub>2</sub> O <sub>3</sub> before regeneration	3			3		
Initial conditions		25 °C	1 bar		25 °C	1 bar
Time / T / P recompression	1 h	25 °C	1 bar	1 h	25 °C	1 bar
<b>Reactivation catalyst 2</b>						
Loss Pd/Al <sub>2</sub> O <sub>3</sub> after reactivation	0.0%			0.0%		
Ratio reactant per Pd/Al <sub>2</sub> O <sub>3</sub>	13.889			0.0		
No cycles Pd/Al <sub>2</sub> O <sub>3</sub> before reactivation	3			1		
Initial conditions		25 °C	1 bar		25 °C	1 bar
Time / T / P recompression	2 h	550 °C	20 bar	1 h	200 °C	1 bar

**Table S3.** (to be continued)

<b>Process</b>	<b>Single-reactor process</b>			<b>Two-step process</b>		
<b>Azeotropic distillation + MIBK</b>

## Definition of Environmental Impacts

### GWP (Global Warming Potential) [GWP100]

This indicator reports the potential impact on climate change over a period of 100 years through the emission of greenhouse gases, expressed in kg of CO<sub>2</sub> equivalent (CO<sub>2</sub>-eq). It considers greenhouse gas emissions such as carbon dioxide CO<sub>2</sub>, methane CH<sub>4</sub>, N<sub>2</sub>O nitrous oxide, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride all absorbing and infrared emitting gas on the list of the Kyoto Protocol of 1997. This indicator relies on the characterization factors (global warming powers) published by the Intergovernmental Panel for Climate Change (IPCC) in 2013.<sup>58</sup> The carbon sink, that is the CO<sub>2</sub> of which the carbon is of plant origin, is not considered, so the characterization factor of bio-based methane is modified to consider the CO<sub>2</sub> taken from the atmosphere during its generation.

### Toxicity indicators: Human Toxicity [HTP], Freshwater Aquatic Exotoxicity Potential [FAETP], Marine Aquatic Ecotoxicity Potential [MAETP] et Terrestrial Ecotoxicity Potential [TETP]

These indicators measure the impact of carcinogenic and non-carcinogenic compounds, including traces of metallic elements, biocides or organic compounds such as polycyclic aromatic hydrocarbons (PAHs), and fine particles and dioxins on the metabolism of living beings. Factors describing the fate, exposure and effects of toxic substances are defined for an infinite time horizon. For each substance, toxicity is expressed in kg of 1,4-dichlobenzene equivalent (1,4-DB-eq).

### Water Use [Water]

The indicator aggregates the amounts of water taken from the natural environment, omitting the amounts used for cooling purposes, and water involved in hydropower production. It considers any local stress factor on the availability of the resource. It is expressed in m<sup>3</sup> of water. Given the high uncertainty related to this indicator, results shall be interpreted with caution.

### Energy indicators:

The Primary Energy Demand (PED) is the quantity of energy directly withdrawn from the hydrosphere, atmosphere or geosphere, or energy source without any anthropogenic change. For fossil fuels and uranium, this would be the amount of resource withdrawn expressed in its energy equivalent (i.e. the energy content of the raw material). For renewable resources, the energy involved in biomass consumption is considered. For hydropower, the energy change in potential energy of water (i.e. from the height difference) is considered. The aggregated values of the different energies are defined as follows:

The total '**Primary energy consumption non-renewable**' [**Non-Renew**], given in MJ, characterizes the gain from natural gas [gas], crude oil [Oil], coal [Coal] and nuclear [Uranium]. Natural gas and crude oil are used both for energy production and as material constituents (e.g., in plastics). Coal is primarily used for energy production. Uranium is only used for electricity production in nuclear power stations. The total non-renewable energy consumption represents the sum of the 4 previous indicators.

The total '**Primary energy consumption renewable**' [**Renew**], given in MJ, comprises hydropower [hydroelectric], wind power [wind], solar energy [solar], geothermic power [geothermal], hydrogen power [hydrogen] and biomass [biomass and forestry]. The end energy (e.g., 1 kWh of electricity) and the primary energy used are not miscalculated with each other; otherwise, the efficiency for production or supply of the end energy is not be accounted for. The total renewable energy consumption represents the sum of the 6 previous indicators. The energy content of manufactured products is considered as feedstock energy content. It is characterized by the net calorific value of the product. It represents the still-usable energy content.

### Abiotic Depletion Potential [ADP]

It is the depletion of the environment in terms of mineral resources. The calculation is performed considering the remaining stocks and the current consumption rate of each of the treated mineral resources. The disappearance of living species and the loss of biodiversity associated with certain emissions are not considered by this indicator. Water is not considered in this indicator. It is expressed in kg antimony (Sb) equivalent (Sb) (Sb-eq).

### Quantitative Land use [Land Use]

This indicator measures the reduction of biodiversity of species caused by land use. Agriculture and deforestation are major contributors to this category. It is expressed in square metters per year (m<sup>2</sup>a).

### Acidification Potential [AP]

Acidification is the result of acid rain due to three types of air pollutants: sulfur dioxide, nitrogen oxides and ammonia. These pollutants come mainly from transport and power stations. Various chemical reactions take place in the air that result in the formation of acidic compounds over long distances causing damage to the flora and fauna when they fall on the ground and in the aquatic environment. This indicator for the

CML 2001 method considers terrestrial and aquatic acidification and represents the increase of acidic compounds such as  $\text{NO}_x$  and  $\text{SO}_x$  in the atmosphere. It is expressed in kg of  $\text{SO}_2$  equivalent ( $\text{SO}_2$ -eq).

#### Eutrophication Potential [EP]

Eutrophication is defined as the enrichment of nutrient in aquatic or terrestrial compartments as a result of human intervention. Air pollutants, wastewater and fertilization in agriculture contribute to eutrophication. The result in water is accelerated algae growth, which in turn, prevents sunlight from reaching the lower depths. This leads to a decrease in photosynthesis and less oxygen production. In addition, oxygen is needed for decomposition of dead algae. Both effects decrease the oxygen concentration in water that can lead to fish dying and anaerobic decomposition (decomposition without oxygen). Hydrogen sulphide and methane are thereby produced. The characterization method used (CML) takes account of the emission of nitrogenous and phosphorous substance in air and ground water. It is based on the ability of a substance to contribute to the profusion of algae. It is expressed in kg of phosphate equivalent ( $\text{PO}_4$ -eq).

#### Ozone Layer Depletion [DP]

The ozone layer filters out ultraviolet (UV) radiation. This indicator measures the potential reduction of stratospheric ozone layer and thus increases UV radiation reaching the Earth. It has diverse impacts on human health, such as skin cancer and cataracts, and may also damage terrestrial life and aquatic ecosystems. The destruction of the stratospheric ozone layer (particularly over the poles) is mainly due to a catalytic destruction of ozone by atomic chlorine and bromine. The main source of these halogen atoms in the stratosphere is the photodissociation of chlorofluorocarbons (CFCs) such as 'freons' and bromofluorocarbons compounds such as 'halons'. These compounds are transported into the stratosphere after being emitted at the surface of the Earth mainly due to man-made activities. This indicator is expressed in kg of CFC-11 equivalent (CFC11-eq) (CFC = trichlorofluoromethane).

#### Photochemical Oxidant Creation Potential [POCP]

This indicator measures the effects on human health associated with the formation of tropospheric ozone, also called 'summer smog'. The pollutants that cause ground-level ozone are  $\text{NO}_x$  and volatile organic compounds (VOCs) that are mainly emitted by road traffic and industry. Under certain climate conditions, these pollutants can react in a complex manner under the influence of solar irradiation and lead to photochemical ozone creation that may be responsible of respiratory disorders. It is expressed in kg of ethylene equivalent ( $\text{kg C}_2\text{H}_4$ -eq).
