13 **SUPPLEMENTARY NOTES**

14 Supplementary Note 1 | The formulas of removal rate and adsorption capacity of
15 PFOA by CSLA:

16 The removal rate of CSLA towards PFOA (R , %) and the mass of PFOA
17 adsorbed by unit mass of CSLA at desired time (q_t , mg/g) and equilibration time (q_e ,
18 mg/g) were calculated according to the following equations (1–3):

19
$$R\% = \frac{C_0 - C_e}{C_0} \times 100\% \quad (1)$$

20
$$q_t = \frac{(C_0 - C_t)V}{m} \quad (2)$$

21
$$q_e = \frac{(C_0 - C_e)V}{m} \quad (3)$$

22 Where C_0 , C_t and C_e (mg/L) denote the initial, immediate and final PFOA
23 concentrations, respectively; V (L) stands for the volume of the PFOA solution used,
24 and m (mg) presents the weight of CSLA.

25

26 Supplementary Note 2 | Measurement and analysis:

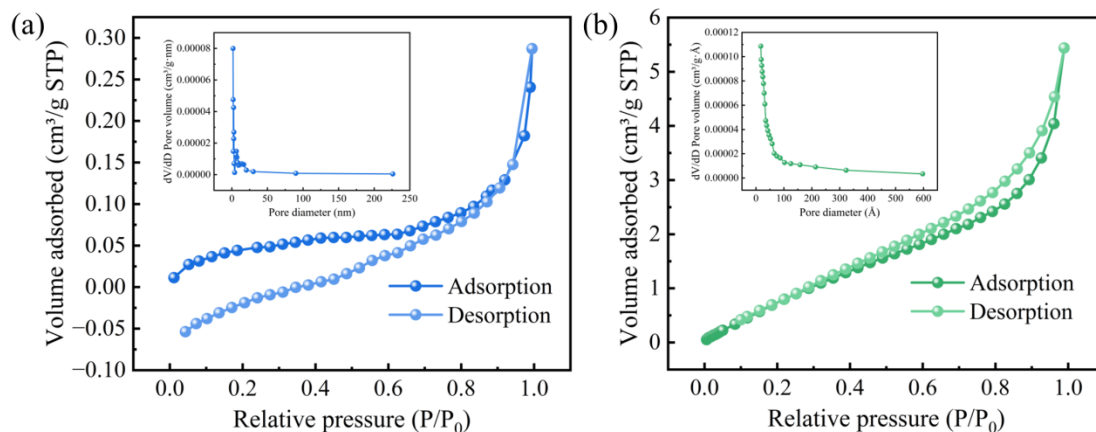

27 This study used scanning electron microscopy (SEM, Hitachi Regulus 8100,
28 Japan) and energy dispersive X-Ray spectrometer (EDS, Ultim Max 65, UK) to
29 observe the surface morphology and element weight ratio of CSLA; the element
30 content analysis and valence state calibration of CSLA were performed by X-ray
31 photoelectron spectroscopy (XPS, Thermo fisher Nexsa G2, USA); fourier transform
32 infrared spectroscopy (FTIR, Thermo Fisher Scientific Nicolet iS5, USA) was used to
33 evaluate types of surface functional groups and chemical bonds of CSLA in KBr flake;
34 the surface potentials were determined by a Nano particle potential analyzer
35 (Zetasizer Nano S90, Malvern, UK); thermal stability of CSLA was measured using
36 thermal gravimetric analyzer (TGA, TA TGA 550, USA); the surface area and
37 porosity analyzer (BET, Micromeritics 3FLEX, USA) was used to gauge the specific
38 surface area of CSLA.

39 The concentration of PFOA in the solution was measured by High-Performance
40 Liquid Chromatography Mass Spectrometry (U3000/TSQ quantum). The instrument
41 test conditions of Liquid Chromatography are as follows: the mobile phase is 5
42 mmol/L ammonium acetate aqueous solution and acetonitrile (30:70, V/V); the
43 injection volume is 1 μ L; the column temperature is 40°C; the flow rate is 0.15

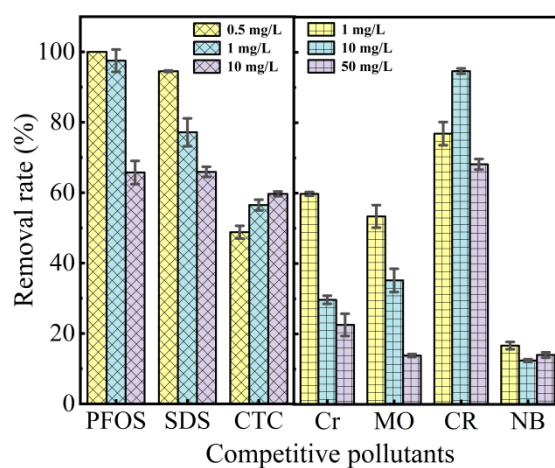

44 mL/min. The mass spectrometer used the anion mode HESI ion source. The scanning
45 conditions were: the ion source temperature was 350°C; the ion source voltage was
46 3000 V, the ion transport tube temperature was 350°C; the sheath gas pressure was 35
47 bar; the auxiliary gas pressure was 10 bar.

48

49 SUPPLEMENTARY FIGURES

51 Fig. S1. The N_2 adsorption-desorption isotherms of (a) lignin and (b) CSLA.

54 Fig. S2. Removal rate of competitive pollutants by CSLA

57 Fig. S3. The adsorption of PFOA on CSLA in actual water.

58

59 Fig. S4. Desorption efficiency experiment.

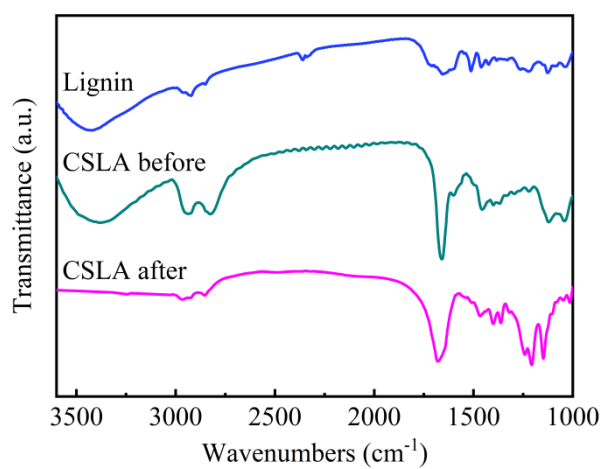

60 The react conditions of the adsorption test are: the initial concentration of PFOA
 61 was 1000 μg/L, the volume of PFOA solution was 50 mL, and the addition amount of
 62 CSLA was 5 mg. In order to obtain the desorption efficiency of PFOA by the mixed
 63 solution of 1% NaCl and 70% methanol, the adsorbed and dried CSLA was added to
 64 50 mL mixed solution for desorption. The concentration of PFOA in the mixed
 65 solution was monitored during the desorption process, and it was found that the
 66 desorption equilibrium was reached after 6 h. The concentration of PFOA in the
 67 mixed solution at desorption equilibrium was 994.05 μg/L, and the desorption rate
 68 reached 99.41%, indicating that the mixed solution of 1% NaCl and 70% methanol
 69 has a good desorption effect on PFOA.

75 PFOA.

76 SUPPLEMENTARY TABLES

77 Table S1. Adsorption kinetic models.

Model	Nonlinear equation	Parameters
Pseudo-first-order	$q_t = q_e(1 - e^{-k_1 t})$	q_e and q_t (mg/g) are the adsorbed amount at an equilibrium concentration (C_e , mg/g) and a predetermined time (t, h) k_1 (h^{-1}) is the rate constants.
Pseudo-second-order	$q_t = \frac{k_2 q_e^2 t}{1 + k_2 q_e t}$	k_2 (g/(mg·h)) is the rate constants for the pseudo-second order.
Elovich	$q_t = \frac{1}{\beta} \ln(1 + \alpha \beta t)$	α (mg/(g·h)) is the initial rate constant, β (mg/g) is the desorption constant.
Intra-particle diffusion	$q_t = K_i t^{1/2} + C_i$	K_i (mg/(g·h ^{0.5})) is the adsorption rate constants of intra-particle diffusion model and C_i is the constant for film thickness of the intra-particle diffusion model.

79 Table S2. Adsorption isotherm models and adsorption thermodynamics equation.

Model	Nonlinear equation	Parameters
Langmuir	$q_e = \frac{q_{\max} K_L C_e}{1 + K_L C_e}$	q_{\max} (mg/g) is the maximum adsorption capacity of the adsorbent, q_e (mg/g) is the adsorption capacity at equilibrium, C_e (mg/L) is the adsorbate concentration at equilibrium, K_L (L/mg) is the constant for the affinity between the adsorbate and the adsorbent.
Freundlich	$q_e = K_F C_e^{1/n}$	K_F (mg/g)·(L/mg) ^{1/n} is the Freundlich constant, n is a dimensionless Freundlich intensity parameter.
Adsorption thermodynamics	$\Delta G^0 = -RT \ln \frac{q_e}{C_e}$ $\Delta G^0 = \Delta H^0 - T\Delta S^0$	<p>R is the universal gas constant (8.314 J/mol·K), T is the absolute temperature (K), q_e (mg/g) is the adsorption capacity at equilibrium, and C_e (mg/L) is the adsorbate concentration at equilibrium.</p> <p>The values of ΔS^0 and ΔH^0 were obtained from the intercept and slope of the line that was plotted by ΔG^0 versus T.</p>

81 Table S3. The parameters of adsorption kinetics models and intra-particle diffusion model.

Parameters	PFOA solution ($\mu\text{g/L}$)		
	250	500	1000
Pseudo first-order			
q_e (mg/g)	4.74	9.49	19.33

91 a The q_e is the saturated adsorption capacity obtained from the adsorption kinetics
92 experiment.

93 b The q_{\max} is the maximum adsorption capacity of the material obtained by Langmuir
94 model fitting in the adsorption isotherm experiment.
