**Table S3.** Determination of UA in sweat samples for recovery using Z-1000/SFE.

## Reagents and Material

Phosphate-buffered saline (PBS) was purchased from Sangon Biotech (Shanghai) Co., Ltd. Ethanol ( $\text{C}_2\text{H}_5\text{OH}$ ),  $\text{NaHCO}_3$ , glycerin and formic acid ( $\text{CH}_2\text{O}_2$ ) were all purchased from Sinopharm Chemical Reagent Co., Ltd.  $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ , 2-methylimidazole and  $\text{CaCl}_2$  was purchased from Aladdin Reagent Co., Ltd. Petroleum jelly was provided by Shanghai Macklin Biochemical Technology Co., Ltd. Ag/AgCl ink and carbon ink were purchased from Weihai Poten Technology Co., Ltd. (Wei-hai, China). The secondary distilled water required for the experiment was supplied by Milli-Q (Millipore, USA). PBS solution was used to prepare the following buffers: 1 mM PBS solution (pH 7.0) and 10 mM PBS solution (containing 100 mM NaCl, pH 7.0). The chemical reagents used are all analytical grade.

## **Apparatus and characterization**

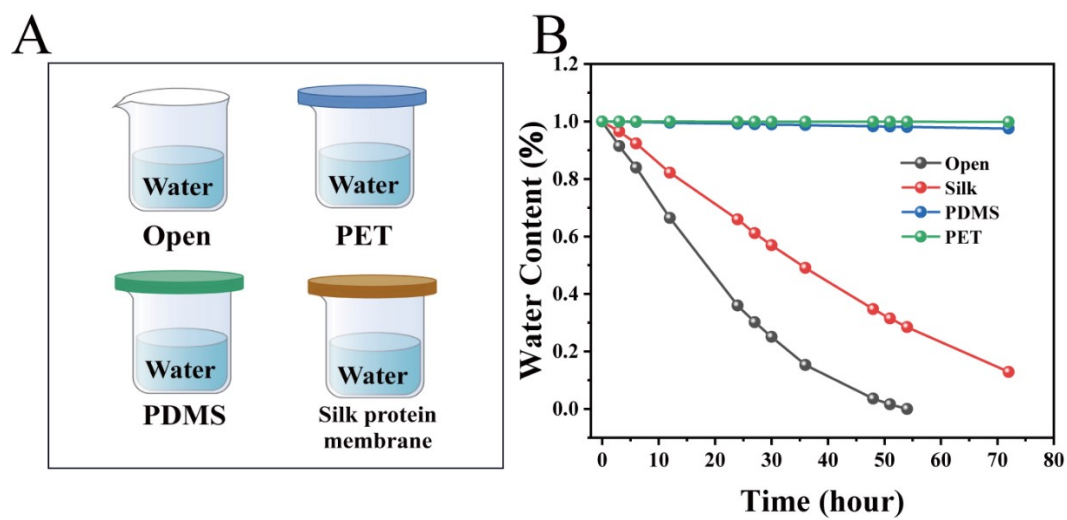

Sample morphology analysis was performed using a field emission scanning electron microscope (FESEM, Hitachi Regulus 8100) and a transmission electron microscope (TEM, Hitachi HT7700). Phase analysis and surface chemical characterization were performed using a powder X-ray diffractometer (PXRD, Japan Smart Lab). The crystal structure of the obtained samples was studied using a laser micro-Raman spectrometer (Raman, Thermofisher DXR2, USA). Electrochemical measurements were performed using a CHI 660E electrochemical workstation.

**Table S2. Comparison of analytical results for UA by wearable sensor and HPLC in sweat samples.**

Sample	Wearable sensor	HPLC	$t_{\text{exptl}}$ ( $t_{\text{crit}}[0.05,4] = 2.78$ )
1	$26.7 \pm 0.47$	$27.4 \pm 0.48$	0.94
2	$31.3 \pm 0.89$	$30.8 \pm 0.43$	1.21
3	$18.9 \pm 0.67$	$18.4 \pm 0.57$	0.77

The t-test was performed to verify the correlation of test results between wearable electrochemical sensor ( $n_1$ ,  $s_1$ ,  $\bar{x}_1$ ) and high-performance liquid chromatography (HPLC) method ( $n_2$ ,  $s_2$ ,  $\bar{x}_2$ ). The combined standard deviation of two data sets was calculated according to the formula:

$$s = \sqrt{\frac{s_1^2(n_1 - 1) + s_2^2(n_2 - 1)}{(n_1 - 1) + (n_2 - 1)}}$$

then the t-value was calculated, and the formula was

$$t = \frac{|\bar{x}_1 - \bar{x}_2|}{s} \sqrt{\frac{n_1 n_2}{n_1 + n_2}}$$

**Table S3.** Determination of UA in sweat samples for recovery using Z-1000/SFE.

Sample	Added ( $\mu\text{M}$ )	Found ( $\mu\text{M}$ )	Recovery (%)	RSD (%)
1	10	$9.96 \pm 0.410$	99.6	2.70
2	15	$15.2 \pm 0.212$	101	1.06
3	20	$25.5 \pm 0.444$	102	1.02
