

**Light-assisted electrocatalytic PMS activation system
based on Co₃O₄-SnO₂/NF cathode for efficient
degradation of tetracycline over wide pH conditions**

56 **Table S6** Comparison of EE/O values with other reported PMS-activation systems

57 **Text S1**

58 The process efficiency can be evaluated by the electrical energy per order (EE/O).

59 EE/O represents the electrical energy required to reduce the pollutant concentration by

60 one order of magnitude in 1 m³ of wastewater and serves as an important indicator for

61 assessing the energy consumption level of the degradation process, as shown in Eq (1).

62
$$EE/O (KW \cdot h \cdot m^{-3}) = \frac{U \times I \times t}{V \times \log_{10}(C_0/C_t)} \quad (1)$$

63 **Text S2**

64 The formation rate of $^1\text{O}_2$ in electrochemical system was determined by reaction
65 rate of between FFA and $^1\text{O}_2$ ($k_{1\text{O}_2}$, $\text{FFA} = 1.2 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$). The steady-state
66 concentration of $^1\text{O}_2$ ($[^1\text{O}_2]_{\text{ss}}$) can be determined by dividing the observed FFA
67 degradation rate by the biomolecular reaction rate constant of FFA with $^1\text{O}_2$ according
68 to Eq. (2).

69
$$[^1\text{O}_2]_{\text{ss}} = \frac{\ln\left(\frac{\text{FFA}_0}{\text{FFA}_t}\right)}{dt k_{1\text{O}_2}} \quad (2)$$

Table S1 HPLC analysis method for different target pollutants.

Target pollutant	Wavelength (nm)	Temperature (°C)	Flow rate (mL/min)	Mobile phase A	Mobile phase B
TC	350	34	0.5	40 % Methanol	60% 0.1% formic acid
				20% Methanol	80% H ₂ O
FFA	220	32	0.8		

Table S2 Estimated mass loading of Co₃O₄-SnO₂ composite on NF

Oxide	Wt% (from EDS)	Mass (mg)	Mass loading (mg·cm ⁻²)
Co ₃ O ₄	65.8%	33.1	3.31
SnO ₂	34.2%	17.2	1.72
Total	100%	50.3	5.03

113 **Table S3** Specific surface area and pore size of SnO₂/NF, Co₃O₄/NF and Co₃O₄-

114 SnO₂/NF samples.

Sample	BET surface area	Pore size
	(m ² /g)	(nm)
SnO ₂ /NF	40.5003	10.33150
Co ₃ O ₄ /NF	23.5939	21.12187
Co ₃ O ₄ -SnO ₂ /NF	58.3989	7.61836

116 **Table S4** Pseudo-first-order kinetic parameters (k and R²) for TC degradation in

117 different systems.

System	k (min ⁻¹)	R ²
EC+Co ₃ O ₄ -SnO ₂ /NF	0.0116	0.9931
PMS	0.0245	0.9775
Co ₃ O ₄ -SnO ₂ /NF	0.0011	0.9659
EC+PMS	0.0335	0.9972
EC	0.0085	0.9883
PC+PMS	0.0649	0.9582
Co ₃ O ₄ -SnO ₂ /NF+PMS	0.0823	0.9684
EC+Co ₃ O ₄ -SnO ₂ /NF+PMS	0.1925	0.9741
PEC+Co ₃ O ₄ -SnO ₂ /NF+PMS	0.1828	0.9825

118

119 **Table S5** Pseudo-first-order kinetic parameters (k and R²) for TC degradation in the

120 EC+PMS+Co₃O₄-SnO₂/NF system under different pH conditions.

pH	k (min ⁻¹)	R ²
3	0.1783	0.9885
5	0.1512	0.9530
Natural pH (5.8)	0.1925	0.9741
7	0.1769	0.9850
9	0.1329	0.9558
11	0.0785	0.9676

Table S6 Comparison of EE/O values with other reported PMS-activation systems

Process	EE/O (kWh m ³ order ⁻¹)	References
E-PMS-O ₃	4.338	(Xue et al. 2024)
