#### 49 **Text S1. Chemicals**

50 Benzo(a)anthracene (BaA,  $\geq 98.0\%$ ), Benzo(a)pyrene (BaP,  $\geq 95.0\%$ ),  
51 Indeno(1,2,3-cd)pyrene (IcdP,  $\geq 95.0\%$ ) and Dibenzo(a,h)anthracene (DaA,  $\geq 95.0\%$ )  
52 were obtained from Aladdin Biochemical Technology Co., Ltd. Citric acid (CA,  
53  $\geq 97.0\%$ ), Oxalic acid (OA,  $\geq 97.0\%$ ), Malic acid (MA,  $\geq 97.0\%$ ) and Tartaric acid (TA,  
54  $\geq 97.0\%$ ) were all purchased from Aladdin Biochemical Technology Co., Ltd. All  
55 solvents (HPLC grade) used for sample processing and analysis, including  
56 dichloromethane, n-hexane, methanol and acetonitrile, were purchased from Sigma-  
57 Aldrich Corporation. Sodium bicarbonate ( $\text{NaHCO}_3$ ,  $\geq 98\%$ ), sodium hydroxide  
58 ( $\text{NaOH}$ , analytical grade), hydrochloric acid ( $\text{HCl}$ ,  $\geq 98\%$ ), phosphoric acid ( $\text{H}_3\text{PO}_4$ ,  
59  $\geq 98\%$ ), 5,5-dimethyl-1-pyrroline-N-oxide (DMPO,  $\geq 98\%$ ), 2,2'-bipyridine (BPY,  
60  $\geq 99\%$ ), were obtained from Shanghai Macklin Biochemical Co., Ltd. Potassium  
61 dichromate ( $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $\geq 98\%$ ), sulfuric acid ( $\text{H}_2\text{SO}_4$ , analytical grade) ferrous sulfate  
62 ( $\text{FeSO}_4$ ,  $\geq 98\%$ ) were obtained from Shanghai Pharmaceutical Group Chemical  
63 Reagents Co., Ltd.

#### 64 **Text S2. Methods of soil physicochemical properties**

65 Soil organic matter (SOM) was measured using  $\text{K}_2\text{Cr}_2\text{O}_7$  oxidation external  
66 heating method. First, 1.0 g of soil was placed into a 50 mL centrifuge tube. Next, 5  
67 mL of  $\text{K}_2\text{Cr}_2\text{O}_7$  solution and 5 mL of  $\text{H}_2\text{SO}_4$  were added to the tube to facilitate mixing.  
68 The mixture was then placed in a 100 °C incubator and heated for 90 minutes. After  
69 this, the volume was adjusted to 50 mL by adding distilled water. The sample was  
70 subsequently centrifuged, and the supernatant was collected. The absorbance of the

---

71 supernatant was measured at a wavelength of 590 nm using a UV-vis  
72 spectrophotometer[1].

73 Soil Electrical Conductivity (EC) was measured using water extraction method.  
74 Both oven-dried and air-dried soil samples were first sieved through a 2-mm mesh.  
75 Exactly  $50.00 \pm 0.01$  g of each soil sample was weighed into a wide-mouth bottle. Then,  
76 250 mL of CO<sub>2</sub>-free deionized water was added to the bottle, which was immediately  
77 sealed to prevent atmospheric CO<sub>2</sub> absorption. The mixture was vigorously shaken for  
78 3 minutes to ensure complete soil-water interaction. After shaking, the suspension was  
79 rapidly filtered through a Buchner funnel under vacuum to obtain a clear extract. The  
80 filtrate was promptly analyzed for electrical conductivity using a calibrated  
81 conductivity meter at room temperature ( $25 \pm 1^\circ\text{C}$ ). All extractions were performed in  
82 triplicate to ensure reproducibility.

### 83 **Text S3. Purification method of soil samples**

84 Purification column was used to purify the extract, the column was pre-washed  
85 with 10 mL n-hexane and dichloromethane, respectively. The leaching rate was  
86 controlled at 2 mL/min. Before the anhydrous sodium sulfate at the top was exposed to  
87 air, the polytetrafluoroethylene piston at the bottom of the chromatographic column  
88 was closed and the effluent was discarded. To purify the extract, about 1 mL of the  
89 concentrated extract was transferred to the chromatographic column, and the  
90 concentrator was washed three times with 2 mL n-hexane. All the washing liquid was  
91 transferred to the chromatographic column, and the target substance was eluted with 25  
92 mL n-hexane solution before the anhydrous sodium sulfate at the top was exposed to

---

93 the air. The eluent was collected in the concentrator. The eluent was concentrated to  
94 about 1 mL by nitrogen blowing enrichment method, added to about 3 mL acetonitrile,  
95 and then concentrated to less than 1 mL, the solvent was completely converted to  
96 acetonitrile, and the volume was determined to be 1 mL to be measured.

#### 97 **Text S4. Quantification of ·OH**

98 At the predetermined time intervals, 0.5 g of soil was taken into a 50 mL centrifuge  
99 tube and 10 mL methanol was added to extract 7 - hydroxycoumarin (7 - COU). The  
100 sample was ultrasound and centrifuged at 3000 r/min for 5 min, the supernatant was  
101 collected into a nitrogen blow tube, nitrogen was blown to near dryness and then 1 mL  
102 of methanol was added. The supernatant was filtered through 0.22 μm filter membrane.  
103 The filtered supernatant was injected into a liquid phase vial to determine the  
104 concentration of 7 - COU. The instrument of HPLC (Thermo Fisher Ultra 3000)  
105 equipped with a ultraviolet detector was used to analyze 7-COU at  $\lambda = 228$  nm. The  
106 mobile phase was a mixture of aqueous phosphate and acetonitrile (v/v = 85:15) at a  
107 flow rate of 1.0 mL/min [2].

#### 108 **Text S5. Electron paramagnetic resonance (EPR) analysis**

109 The electron paramagnetic resonance (EPR) spectra were collected using a Bruker  
110 EMX/plus EPR spectrometer (E500-9.5/12, Germany). The parameters of the EPR  
111 spectrometer were set as: center field at 3510 G, X-band microwave frequency of 9.85  
112 GHz, microwave power of 1.70 mW, spectral window of 100 G, modulation amplitude  
113 of 1.00 G, modulation frequency of 100 kHz, time constant of 163.84 ms, conversion  
114 time 40.00 ms, sweep time 40.96 s and 5 times of X-scans.

---

**115 Text S6. Determination of dissolved and adsorbed Fe in soil**

116 At predetermined time intervals, 0.5 g of soil was taken into 5 mL centrifuge tube,  
117 4 mL of deionized water was added. The sample was shaken for 30 min and  
118 centrifuged at 3000 r/min for 5 min. The supernatant was collected to obtain dissolved  
119 Fe. The residual soil was treated with 3 mL H<sub>2</sub>SO<sub>4</sub> and 1 mL HF and digested at 120  
120 °C for 30 min, and then 1 mL H<sub>3</sub>BO<sub>4</sub> solution was added to stand for 10 min. The sample  
121 was filtered to obtain adsorbed Fe. The dissolved Fe and adsorbed Fe were determined  
122 by 1,10-o-phenanthroline colorimetric method [3].

**123 Text S7. Cyclic voltammetry (CV) test**

124 Cyclic voltammetry (CV) was performed on a computer-controlled CHI-660C  
125 electrochemical workstation using a three-electrode cell, using a platinum electrode as  
126 the working electrode, an Ag/AgCl electrode (saturated with KCl) as the reference  
127 electrode, and a saturated calomel reference electrode (SCE) as the auxiliary electrode  
128 between -0.10 and +1.30V. CV were recorded at a scan rate (v) of 50 mV/s in a 0.05  
129 M KCl solution (pH 6) containing 20 mM of Fe(II) or Fe(II)-CA. These electrolyte  
130 solutions were purged with argon for 30 min for removal of dissolved oxygen before  
131 starting the measurements.

**132 Text S8. Determination of the intermediates of BaP**

133 To analyze the possible intermediates of BaP degradation, the sampled solution  
134 was measured by Ultra-High Performance Liquid Chromatography coupled with  
135 Quadrupole-Orbitrap High-Resolution Mass Spectrometry (UHPLC-Q-Orbitrap  
136 HRMS, Thermo Scientific, USA) with a Hypersil GOLD C18 column (150 × 2.1 mm,

---

137 3  $\mu\text{m}$ ). The following chromatographic conditions were used: flow rate of 0.3 mL/min,  
138 injection volume of 5  $\mu\text{L}$ , mobile phase A consisting of a 0.1 % formic acid aqueous  
139 solution, and mobile phase B consisting of acetonitrile. The gradient elution program  
140 started with 10 % mobile phase B for 1 min, followed by a linear increase to 99 %  
141 mobile phase B over 3 min, and then returned to the initial ratio and maintained for 6  
142 min. The mass spectrometry conditions included a mass scanning range of 50–800 m/z  
143 in the positive mode, with a source temperature of 350 °C and a sheath gas flow rate of  
144 12 L/min [4].
