I. Computational methods and details

The geometric optimizations of $\text{Au}_{99+31n}(\text{SR})_{40+10n}$ ($n = 0, 1, 2, 3$) cluster series are implemented in CP2K Code¹ based on the level of PBE^{2, 3}(D3BJ)^{4, 5}/DZVP-MOLOPT-SR-GTH. To ensure the rationality of structural optimization, the sizes of cells of these clusters are set to 26.25870000^3 Å³, 29.05660000^3 Å³, 32.14064023^3 Å³ and 34.93894883^3 Å³, respectively. The convergence threshold of density matrix of inner SCF is 1.0E-06. The maximum geometry change, RMS geometry change, Maximum force and RMS force is set to 3E-3, 1.5E-3, 4.5E-4 and 3E-4, respectively. The single-point energy and sTDA⁶ calculations of $\text{Au}_{99+31n}(\text{SR})_{40+10n}$ ($n = 0, 1, 2, 3$) cluster series are implemented using the ORCA 5.0.4 program system^{7, 8} at theoretical level of PBE0(D3BJ)/Def2-TZVP¹⁰ and PBE0(D3BJ)⁹/Def2-SV(P)¹⁰, respectively. The convergence criteria were maintained at their default settings throughout the computational procedures. Note that the Def2 basis set family incorporates relativistic pseudopotentials for elements beyond the fourth period, thereby effectively accounting for scalar relativistic effects in these heavy metal-containing systems.

In sTDA calculations, the energy threshold is set to 4 eV, which is sufficient to ensure that the computed spectra cover the wavelength range of interest. Additionally, the parameters of PThresh and PTLimit are set to 1.0×10^{-4} and 30, respectively, to control the range of configuration functions, with negligible sacrifice in accuracy. All R ligands were simplified to methyl substituent groups in all calculations. Finally, the wavefunction analyses and electronic structure characterizations were conducted using the Multiwfn software package (version 3.8_dev)^{11, 12}, with all molecular orbital isosurfaces visualized through integration with the VMD 1.9.3 software.

Figure S4. Molecular Orbital Diagrams of $\text{Au}_{99+31n}(\text{SR})_{40+10n}$ cluster sequence. It is worth mentioning that in the energy calculations, the unrestricted open-shell method was adopted for $\text{Au}_{99}(\text{SR})_{40}$ and $\text{Au}_{161}(\text{SR})_{50}$, where only their alpha orbital isosurface plots are presented here. This is sufficient to demonstrate the fact that both their HOMO and LUMO are predominantly contributed by the atomic orbitals of Au. In the orbital isosurfaces, cyan and red colors represent the positive and negative phases of the orbitals, respectively. The atomic color codes: orange, yellow, gray, and white correspond to Cu, S, C, and H atoms, respectively.
