1. Single crystal X-ray diffraction

A colourless, block-like specimen of $C_{19}H_{20}O_3S$, approximate dimensions 0.103 mm x 0.143 mm x 0.330 mm, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured ($\lambda = 0.71073 \text{ \AA}$). The total exposure time was 1.36 hours. The frames were integrated with the Bruker SAINT software package using a narrow-frame algorithm. The integration of the data using a monoclinic unit cell yielded a total of 40667 reflections to a maximum θ angle of 28.35° (0.75 \AA resolution), of which 4259 were independent (average redundancy 9.548, completeness = 99.4%, $R_{\text{int}} = 4.91\%$, $R_{\text{sig}} = 3.20\%$) and 2778 (65.23%) were greater than $2\sigma(F_2)$. The final cell constants of $a = 5.2763(4) \text{ \AA}$, $b = 22.1253(17) \text{ \AA}$, $c = 14.7638(12) \text{ \AA}$, $\beta = 95.053(2)^\circ$, volume = $1716.8(2) \text{ \AA}^3$, are based upon the refinement of the XYZ-centroids of 9963 reflections above $20 \sigma(I)$ with $4.607^\circ < 2\theta < 48.49^\circ$. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.898.

The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.9370 and 0.9800. The structure was solved and refined using the Bruker SHELXTL Software Package, using the space group P 1 21/c 1, with Z = 4 for the formula unit, C₁₉H₂₀O₃S. The final anisotropic full-matrix least-squares refinement on F² with 209 variables converged at R1 = 5.10%, for the observed data and wR2 = 14.84% for all data. The goodness-of-fit was 1.060. On the basis of the final model, the calculated density was 1.271 g/cm³ and F(000), 696 e⁻.

2. General information

All reactions were carried out in oven dried glasswares. All the commercially available chemicals (Sigma Aldrich, TCI, Alfa acer, Avra and SRL) were used directly and freshly distilled dry solvents for anhydrous conditions. Column chromatography was performed with silica gel (200 - 300 mesh) using gradient elution with hexane and ethyl acetate mixture as eluent. All the reactions were monitored by thin layer chromatography (TLC) on precoated silica gel plates and visualized under UV chamber. ESI-HRMS spectra were recorded on Agilent advance bio 6545XT LC/Q-TOF mass spectrometer. NMR spectra (^1H and ^{13}C) were recorded on a Bruker 500MHz NMR spectrometer. The solvent signal of CDCl_3 was referenced at 7.26 ppm for ^1H NMR and 77.16 ppm for ^{13}C NMR. Chemical shift values (δ) are quoted in ppm and coupling constants (J) are recorded in hertz (Hz). The following abbreviations classify the multiplicity- s = singlet, d = doublet, t = triplet, m = multiplet, dd = doublet of doublet, q = quartet etc. The UV-visible absorption spectra were recorded with a Jasco V-670 spectrophotometer. The fluorescence emission spectra were recorded using a Horiba FluoroMax⁴ spectrofluorometer. A 40 W Kessil PR160L – 456 nm LED photoreaction lighting (max frequency, max intensity) was employed as a visible light source without the use of filters.

4. Preparation of starting materials

4.1. General procedure for preparation of MBH Alcohols and Bromides:¹

Step-1:

According to the known procedure, a variety of Morita-Baylis-Hillman alcohols have been prepared. In a 10 mL round-bottom flask, a mixture of a given activated olefin (1.2 equiv.), aldehyde (4.71 mmol, 1.0 equiv.), DABCO (1.2 equiv.), and MeOH (2-3 drops) was stirred at room temperature. The stirring was continued until full conversion of limiting starting material. Then, the reaction mixture was quenched with 0.1N HCl, extracted with H₂O and EtOAc. The organic layer was washed with NaHCO₃ and followed by brine solution. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was evaporated in vacuo. The resulting crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (5-20%) as eluent to furnish the corresponding MBH alcohol.

Step-2:

According to known procedure, Morita-Baylis-Hillman alcohols (2.38 mmol, 1.0 equiv), were treated with HBr (6.04 equiv) dropwise in dichloromethane (50mL), then kept at 0 °C and allowed to stir for 10min. Then, Conc. H₂SO₄ was added slowly to a stirred solution and allowed to stir at room temperature for overnight. The reaction mixture was treated with water and extracted with dichloromethane. The organic layer was washed with NaHCO₃ and followed by brine solution. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was evaporated in vacuo. The resulting crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (2%) as eluent to afford MBH allyl bromides (**1a** – **1r**).

5. General procedure for the ethyl (Z)-3-phenyl-2-((phenylsulfinyl)methyl)acrylate (**3a**) synthesis

In a 5mL reaction vial, mixture of ethyl (Z)-2-(bromomethyl)-3-phenylacrylate **1a** (0.111 mmol, 1 equiv) in 4mL of acetonitrile, Triethylamine (1 equiv.) and (2,2,6,6-Tetramethylpiperidin-1-yl)oxyl (0.5 equiv.) were added. To the above solution mixture, thiophenol **2a** (3 equiv.) and three mole percent of disodium Eosin-Y as a photocatalyst were added and irradiated with Blue LED 456nm. The solution was allowed to stir for 20 h. After completion, the reaction mixture was treated with NaHCO₃ and extracted with ethylacetate. The organic layer was washed with brine solution. The combined organic layers were dried over anhydrous sodium sulfate or directly without workup, the solvent was evaporated in vacuo. The resulting crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (10%) as eluent to afford the desired ethyl (Z)-3-phenyl-2-((phenylsulfinyl)methyl)acrylate (**3a**) in 91% yield and trace amount of S-phenyl benzenesulfinothioate (**3a'**) as by-product. The same procedure is followed for all other substrate scope compounds.

6. Gram-Scale Synthesis

In a 100mL RB, mixture of ethyl (Z)-2-(bromomethyl)-3-phenylacrylate **1a** (3.71 mmol, 1 equiv) in 80mL of acetonitrile, Et₃N (1 equiv.) and (2,2,6,6-Tetramethylpiperidin-1-yl)oxyl (0.5 equiv.) were added. To the above solution mixture, thiophenol **2a** (3 equiv.) and three mole percent of disodium Eosin-Y as a photocatalyst added and was irradiated with 456nm Blue LED. The solution was allowed to stir for 20 h. After completion, the reaction mixture was treated with NaHCO₃ and extracted with ethylacetate. The organic layer was washed with brine solution. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was evaporated in vacuo. The resulting crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (10%) as eluent to afford the desired ethyl (Z)-3-phenyl-2-((phenylsulfinyl)methyl)acrylate (**3a**) in 71% yield and 16% of S-phenyl benzenesulfinothioate (**3a'**) as by-product.

7. Application of the developed strategy towards biologically relevant molecules²

7.a. Synthesis of ethyl (Z)-3-phenyl-2-((phenylsulfonyl)methyl)acrylate (**5a**)^{2a}

a) To an oven dried 5 mL round bottom flask with a magnetic stir bar and rubber septum was added ethyl (Z)-3-phenyl-2-((phenylsulfinyl)methyl)acrylate **3a** (1 equiv.) in 2 mL of dichloroethane and followed by *m*-CPBA (1.2 equiv.) was added at 0°C. Then, purged the reaction mixture in argon atmosphere and stirred the solution for 30 min at room temperature. After the complete consumption of starting material, the reaction mixture was quenched with NaHCO₃, extracted with ethyl acetate followed by washed with brine solution, and combined organic layers were dried over Na₂SO₄. Then, the solvent was evaporated under reduced pressure. The crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (15%) as eluent to afford the desired ethyl (Z)-3-phenyl-2-((phenylsulfonyl)methyl)acrylate (**5a**) in 99% yield.

7.b. Interrupted Pummerer Reaction of **3a** with Indole^{2b}

Reaction mixture was stirred at -78 °C for 15 min, then allowed to warm up to room temperature and stirred for 1 h. Crude reaction mixture was filtered through a plug of silica, eluted with CH₂Cl₂, and the solvent was evaporated under reduced pressure. The crude residue was purified by silica gel column chromatography using a gradient mixture of hexane/ethyl acetate (5%) as eluent to afford the desired ethyl 2-(phenyl(3-(phenylthio)-1H-indol-2-yl)methyl)acrylate (**6a**) in 65% yield.

7.c. Interrupted Pummerer Reaction of **3a** with Pyrrole^{2b}

Reaction mixture was stirred at -40 °C for 15 min, then allowed to warm up to room temperature and stirred for 1 h. Crude reaction mixture was filtered through a plug of silica, eluted with CH₂Cl₂, and the solvent was evaporated under reduced pressure. The crude residue was purified by silica gel column

chromatography using a gradient mixture of hexane/ethyl acetate (5%) as eluent to afford the desired ethyl 2-(phenyl(2-(phenylthio)-1H-pyrrol-3-yl)methyl)acrylate (**7a**) in 38% yield.

For each quenching experiment, 0.1mL of thiophenol (**2a**) was titrated to a mixed solution of Na₂-EosinY (0.1mL, in a total volume = 1.0mL). Then the emission intensity was recorded.

10. EDA complex studies

To verify the formation of an EDA complex, UV–Visible absorption spectra of all components in the reaction system were recorded individually, as shown in above figure. Upon mixing three components, **1a**, thiophenol (**2a**), and Et₃N, we didn't observed bathochromic shift, even with the addition of TEMPO. Therefore, these results may conclude the nonexistence of EDA complex during the course of the reaction.
