## General Information

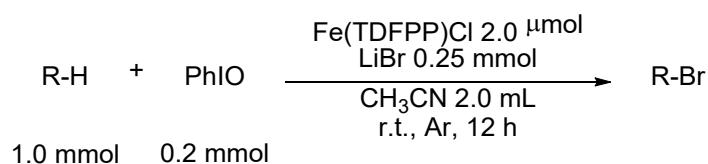

### Materials

Commercially available chemicals were used without further purification unless otherwise noted. Dichloromethane (analytical pure grade) was distilled from calcium hydride and chloroform (analytical pure grade) was distilled from anhydrous potassium carbonate before use.<sup>S1</sup> Iodosylbenzene (PhIO) was synthesized according to a literature method from iodobenzene diacetate purchased from Bide Pharmatech Ltd.<sup>S2</sup> Metal bromides, *n*-Bu<sub>4</sub>N<sup>+</sup>OTf<sup>-</sup>, *cis*- and *trans*- decalin, *n*-dodecane were purchased from Shanghai Titan Co. Ltd. *Meso*-tetramesitylporphyrinatoiron(III) chloride [Fe(TMP)Cl], *meso*-tetrakis(2,6-difluorophenyl)porphyrinatoiron(III) chloride [Fe(TDFPP)Cl], *meso*-tetrakis(2-fluorophenyl)porphyrinatoiron(III) chloride [Fe(TMFP)Cl], *meso*-tetrakis(pentafluorophenyl)porphyrinatoiron(III) chloride [Fe(TPFPP)Cl], and *meso*-tetrakis(2,6-dichlorophenyl)porphyrinatoiron(III) chloride [Fe(TDCPP)Cl] were synthesized according to previously reported procedures.<sup>S3</sup>

### Instrumentation

Gas chromatography/mass spectrometry (GC/MS) was recorded on an Agilent 8890 GC system with 5977 EI MSD Bundle equipped with a capillary column (J&W, HP-5ms, 30 m × 0.25 mm × 0.25 μm). The products of the iron-porphyrin catalyzed bromination reaction were confirmed by comparing the retention time and the mass spectrometry of standard compounds. UV-vis spectrums were recorded on an Agilent Cary 60 UV-vis spectrophotometer equipped with a UNISOKU USP-203 cryostat system. Electrospray ionization mass spectrometry (ESI-MS) was collected on a Thermo Fisher Scientific LTQ Orbitrap Elite Mass Spectrometer by infusing samples directly into the source using a sample syringe. The spray voltage was set at 2.5 kV and the capillary temperature at 120 °C. Cyclic voltammetry was recorded on a CHI760E electrochemical workstation at room temperature. N-Bu<sub>4</sub>N<sup>+</sup>OTf<sup>-</sup> (195.0 mg, 0.5 mmol) was used as the supporting electrolyte and CH<sub>3</sub>CN was used as solvent. The working electrode was a glassy carbon, the counter electrode was a platinum wire. Ag wire was used as pseudo-reference electrode and ferrocene was used as internal standard. Atomic absorption spectroscopy was recorded on an AnalytikJena contraAA 700 at 670 nm.

### Procedure A: Standard procedure of iron porphyrin catalyzed bromination of hydrocarbons

In a glove box filled with argon, [Fe(TDFPP)Cl] (1.7 mg, 2.0  $\mu$ mol), PhIO (44.0 mg, 0.2 mmol), and LiBr (21.7 mg, 0.25 mmol) were added to a 10 ml sealed vial equipped with a magnetic stirrer. Then substrate (1.0 mmol) and CH<sub>3</sub>CN (2.0 mL, HPLC grade) were added to the vial via syringe. The solution turned red and the insoluble PhIO disappeared gradually. The reactions were run at room temperature and completion of the reaction was indicated by the disappearance of the red color of high-valent iron-oxo porphyrin intermediate after 12 h. Once the reaction was completed, the reaction was added with 10 mL of *n*-dodecane and 5 mL of water were added to the reaction residue and the reaction solution was retracted with 2 mL of *n*-hexane. And the organic layer was then analyzed by GC/MS. The assignment of the product was based on the comparison with the GC retention time and the MS spectra of the corresponding authentic samples. The TON of brominated products and side products was based on the added iron porphyrin and determined with *n*-dodecane as internal standard.

### **Procedure B: Competitive kinetic isotope experiments.**

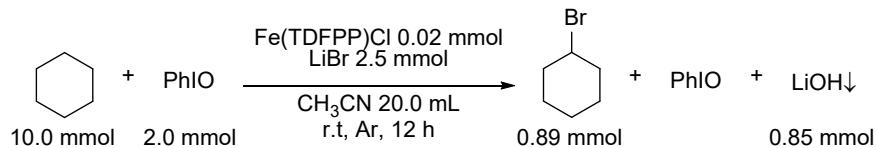

Following the procedure A, the substrate was replaced by the mixture of 0.5 mmol of cyclohexane and 0.5 mmol of cyclohexane-*d*<sub>12</sub> in the reaction of cyclohexane, or the mixture of 0.5 mmol of toluene and 0.5 mmol of toluene-*d*<sub>8</sub> in the reaction of toluene. Then the mixture was extracted and analyzed by GC-MS following procedure A.

### **Procedure C: Generation and characterization of Li<sup>+</sup>-bound iron(IV)-oxo porphyrin species**

Following procedure A and using cyclohexane as substrate, the reaction mixture was immediately filtrated after the reaction started for 1 min to remove unreacted PhIO and 1.0 mM solution of Li<sup>+</sup>-bound iron(IV)-oxo porphyrin species in CH<sub>3</sub>CN was obtained as mother liquor. The ESI-MS sample was prepared by diluting 50  $\mu$ L of mother liquor to 1 mL solution with CH<sub>3</sub>CN at 263 K and stored at 195 K. UV-vis spectrum of 0.025 mM and 0.005 mM Li<sup>+</sup>-bound iron(IV)-oxo porphyrin species was recorded in a 10 mm cuvette at 263 K.

Non-Li<sup>+</sup>-bound compound II was prepared according to previously reported procedure and the UV-vis spectra was recorded in a 10 mm cuvette at 263 K.<sup>S4</sup>

### **Procedure D: Quantitative analysis of LiOH**

In a glove box filled with argon, [Fe(TDFPP)Cl] (17 mg, 0.02 mmol), PhIO (440 mg, 2.0 mmol), LiBr (215 mg, 2.5 mmol) was added to a 50 ml flask and sealed with septum. Then cyclohexane (1.06 mL, 10.0 mmol) and CH<sub>3</sub>CN (20.0 mL, HPLC grade) were added to the flask via syringe and stirred under argon for 12 h. Once the reaction was completed, 0.1 mL dodecane was added as internal standard and the supernatant was analyzed by GC-MS. Then

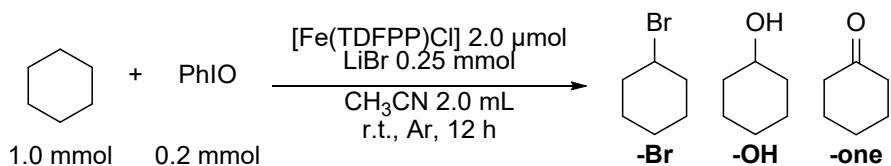

the mixture was filtered through Celite and washed with 20 mL CH<sub>3</sub>CN and 10 mL CH<sub>2</sub>Cl<sub>2</sub> successively. The residue was washed with 20 mL deionized water twice and the filtrate was diluted to 100 mL. 1 mL of the dilute filtrate was taken out and further diluted to 100 mL for AAS analysis and the rest filtrate was titrated by 0.1 M of HCl with methyl orange as indicator to determine the amount of OH<sup>-</sup>, which was formed during the bromination of cyclohexane. GC-MS result showed 0.89 mmol of C<sub>6</sub>H<sub>11</sub>Br was generated. The AAS analysis showed the amount of Li in the residue was 1.10 mmol and the titration experiment showed the amount of OH<sup>-</sup> was 0.85 mmol.

### Procedure E: Cyclic voltammetry

In an oven dried two neck round-bottom bottle equipped with working electrode, counter electrode and reference electrode. LiBr (8.7 mg, 0.1 mmol) and supporting electrolyte was added to the bottle. Then the bottle was purged and charged with argon three times and added anhydrous CH<sub>3</sub>CN (5.0 mL). CV was recorded under room temperature. The scan range was between -0.5 V to 1.5 V (positive) and scan rate was 0.1 V/s. *N*-Bu<sub>4</sub>N<sup>+</sup>Br<sup>-</sup> was tested with the same procedure.

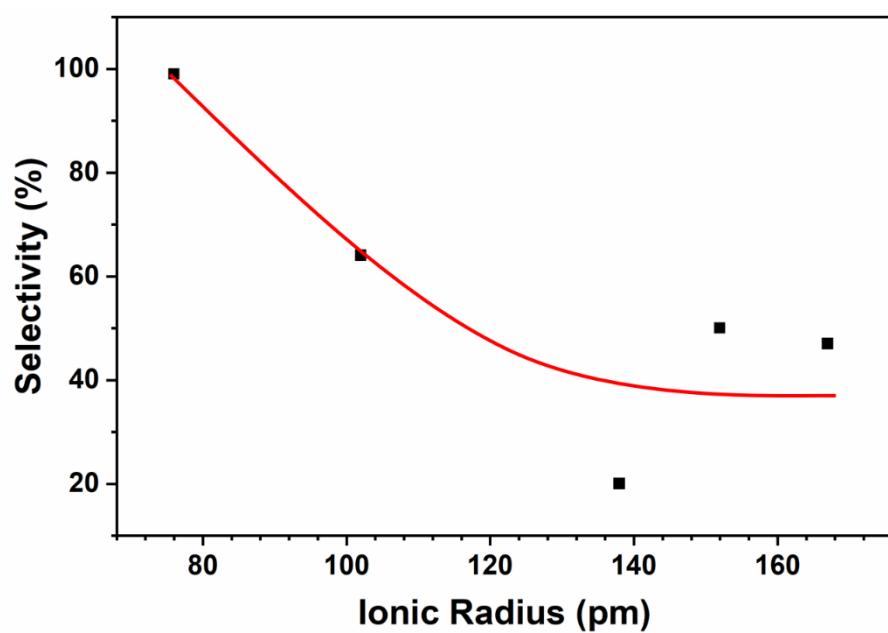

### DFT Calculations

All calculations were performed with the Gaussian 16 software package.<sup>S5</sup> The geometries of investigated species were optimized in conjunction with the SMD<sup>S6</sup> continuum solvation model at the B3LYP<sup>S7</sup>/def2-SVP<sup>S8</sup> level of theory, in which the solvent of CH<sub>3</sub>CN was used. Gibbs energy corrections were obtained at 312K. The electronic energies were further refined with the larger basis set def2-TZVP<sup>S8</sup> for all atoms.

**Figure S4.** Competitive kinetic isotope experiments of cyclohexane and cyclohexane- $d_{12}$ : (a) GC-MS TIC analysis of [Fe(TDFPP)Cl] catalyzed bromination of 1:1 molar ratio mixture of cyclohexane and cyclohexane- $d_{12}$ ; (b) MS spectroscopy of bromocyclohexane- $d_{11}$  generated in the reaction; (c) MS spectroscopy of bromocyclohexane generated in the reaction.

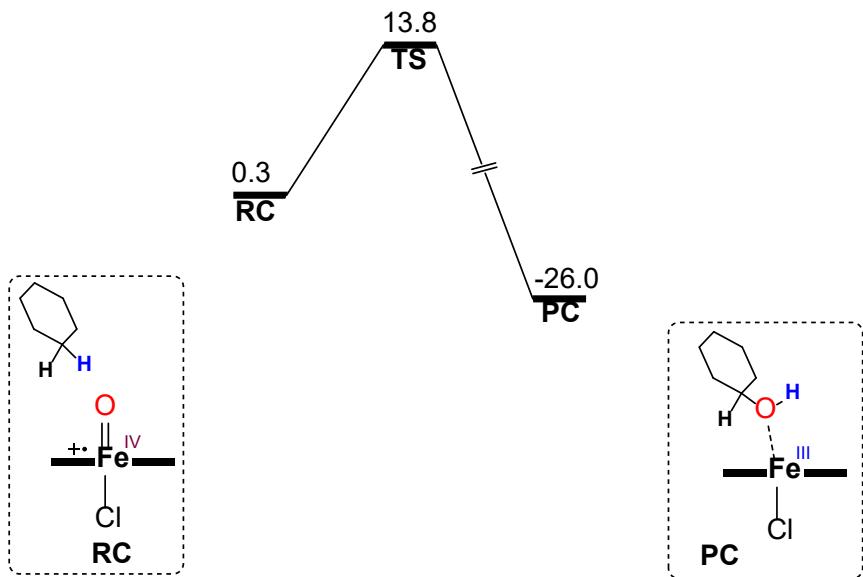

**Figure S5.** Competitive kinetic isotope experiments of toluene and toluene-*d*<sub>8</sub>: (a) GC-MS TIC analysis of [Fe(TDFPP)Cl] catalyzed bromination of 1:1 molar ratio mixture of toluene and toluene-*d*<sub>8</sub>; (b) MS spectroscopy of benzylbromide-*d*<sub>7</sub> generated in the reaction; (c) MS spectroscopy of benzylbromide generated in the reaction.

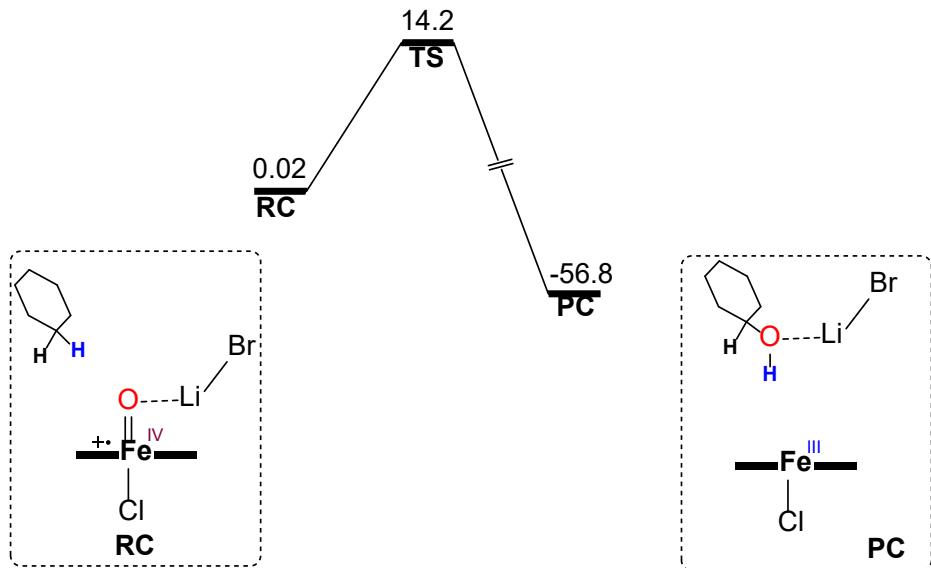

**Figure S6.** GC-MS TIC of iron porphyrin-catalyzed bromination of decalin as diagnostic substrates. (a) *cis*-decalin as the substrate; (b) *trans*-decalin as the substrate.

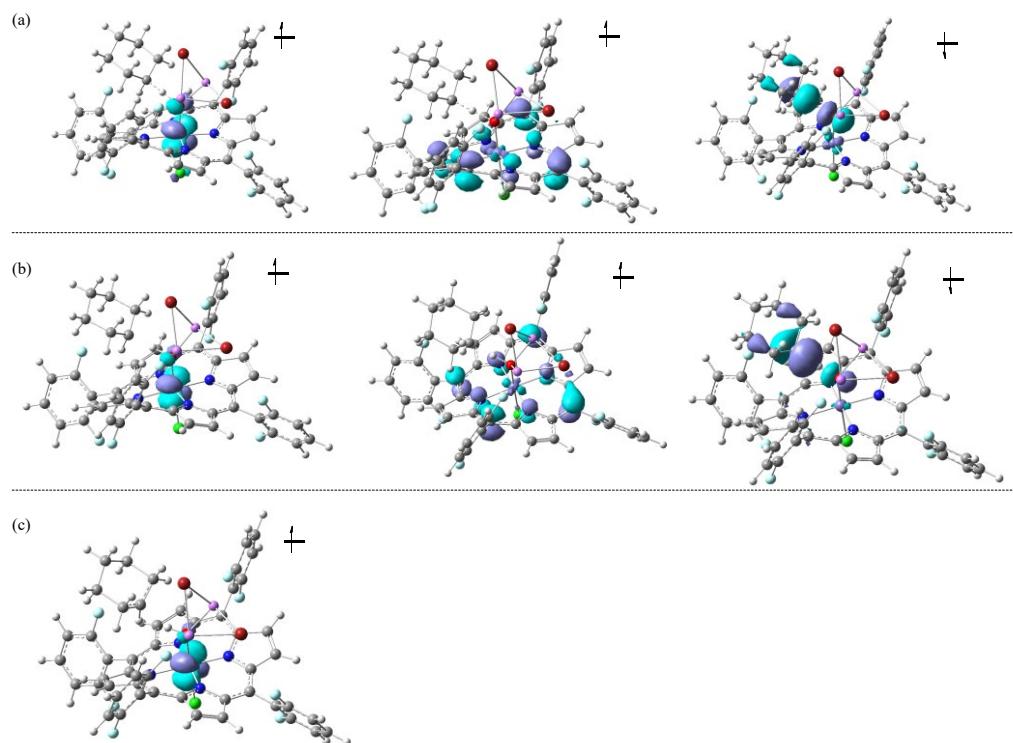

To probe the lifetime of the incipient radical which was generated from H atom abstraction by high-valent iron-oxo intermediate, decalin was selected as the diagnostic substrate. When *cis*-decalin was used, if a long-lived radical was involved in the reaction, *trans*-brominated decalin through radical rearrangement would be obtained. To the opposite, only configuration retained product *trans*-brominated decalin would be obtained when *trans*-decalin was used, since no radical rearrangement can occur in this case. The brominated products obtained in the reaction of *cis*-decalin exhibited the retention time in the range of 11-12 min (Figure S5a, blue region), while the brominated products obtained in the reaction of *trans*-decalin exhibited the retention time in the range of 10-11 min (Figure S5b, red region). As discussed above, only *trans*-brominated decalin would be obtained in the bromination of *trans*-decalin. Therefore, the brominated products with the retention time from 10-11 min can be assigned as *trans*-brominated decalin. Consequently, the brominated products with the retention time from 11-12 min can be assigned as *cis*-brominated decalin in the reaction of *cis*-decalin. This result unambiguously demonstrated that no radical rearrangement occurred in the bromination of *cis*-decalin, suggesting a carbon cation process as discussed in the text. Small amounts of byproducts with the retention time in the range of 7.5-9.5 min were the oxygenated compounds, such as ketone and alcohol products (Figure S5, green region).
