b)

Figure S8 Optical microscopic image of the a) plane paper and b) nanoparticle-reduced paper

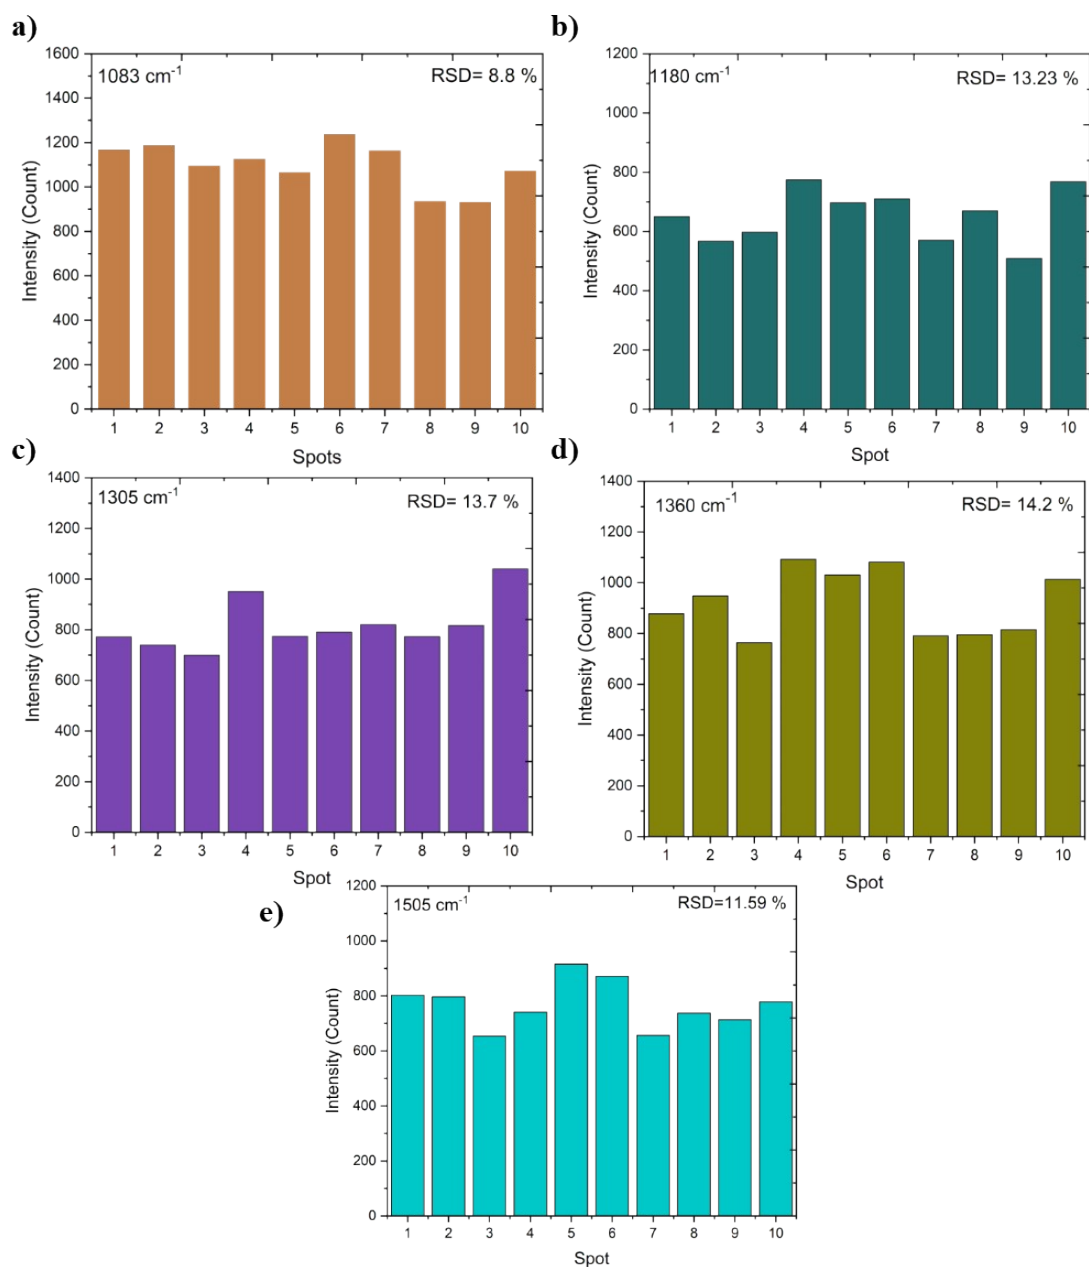

Figure S9 Evaluation of the Raman signal uniformity of Rh6G at different spots on the Au-reduced paper region for various peaks: a)1083 cm^{-1} b)1180 cm^{-1} c)1305 cm^{-1} d)1360 cm^{-1} and e)1505 cm^{-1}

Figure S10 Raman spectra of mixture urea and lactate of different concentrations recorded on the developed substrate.

Figure S11 Comparison of the capillary height using normal filter paper and Au reduced plasmonic paper substrate.

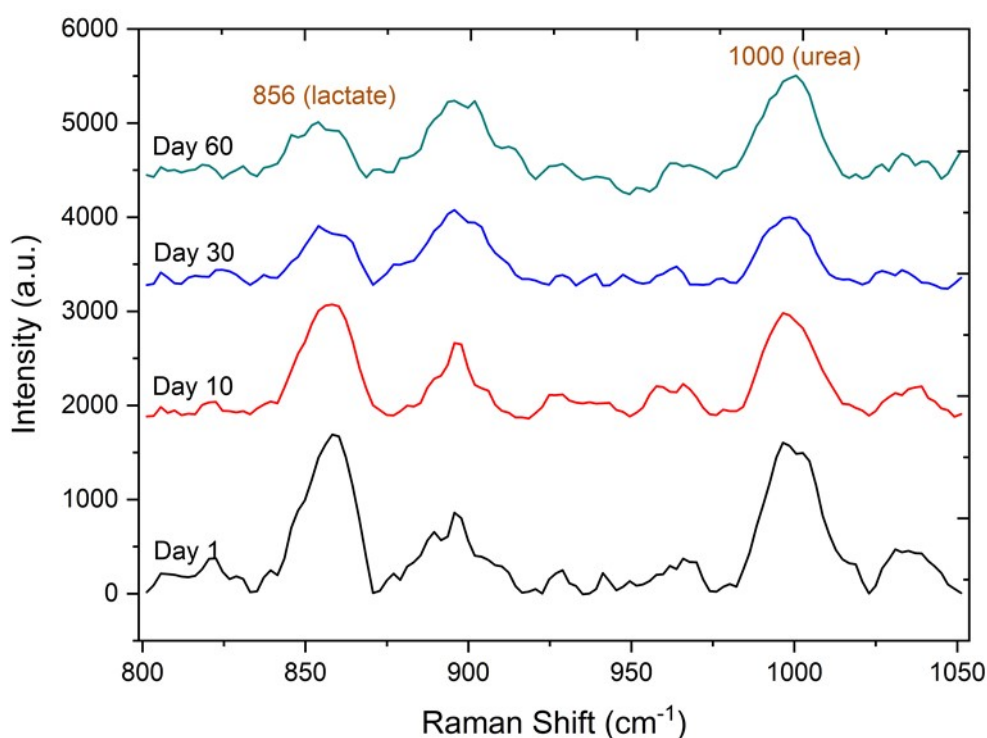

Figure S12 The Raman spectra of sweat recorded with the developed Au@PDMS/OA adhesive patch at different times.

Supplementary table ST1: Comparison of the analytical performance of the present work with similar reported SERS/Raman based sweat sensors.

| No. | Substrate | Target analyte and LOD | | Highlights | Drawbacks/Scope for improvements | Reference |
|-----|---|------------------------|-------------|---|--|-----------------------------|
| | | Urea | Lactate | | | |
| 1 | Wearable Janus fabric embedded with AgNPS | 10 μ M | 10 μ M | <ul style="list-style-type: none"> Microstructured Optical Fiber (MOF) contributes to the enhancement of Raman signal and hence the good LOD Janus Textile Design ensures efficient sweat absorption and rapid transport to the sensing region High sensitivity and specificity, due to MOF and plasmonic nanostructures | <ul style="list-style-type: none"> Optical fiber integration adds cost and complexity Less scalable May need additional modifications for multi-analyte detection | Han et al. ¹ |
| 2 | Scotch tape based adhesive patch Au nanostars | 0.6 μ M | 0.7 μ M | <ul style="list-style-type: none"> The plasmonic gold nanostars (GNS) helps in optimum SERS enhancement simultaneous detection of lactate, urea, and glucose Flexible & low-Cost adhesive tape based wearable patch for real-time monitoring | <ul style="list-style-type: none"> Complexity in fabricating uniform sharp branched GNS and reproducibility The synthesis of anisotropic GNS requires careful control for batch consistency Durability of the adhesive tape-based substrate over the time | Supriya et al. ² |

| | | | | | | |
|---|---|-------------|-------------|---|--|-------------------------------|
| 3 | PE film based flexible wearable patch with Au-Ag nanoshuttles (Au-Ag NSs) | 2.3 μ M | 8.6 μ M | <ul style="list-style-type: none"> • Au-Ag NSs for highly sensitive simultaneous detection of urea and lactate. • Integrated a microfluidic system with capillary-driven flow for consistent and concentrated sweat collection • The patch material is biocompatible and flexible | <ul style="list-style-type: none"> • Complexity in fabricating microfluidic based channels and hence the scalability • Requires precise synthesis of Au-Ag NSs and reproducibility challenges • Durability and wearability concerns for long time use | Yang et al. ³ |
| 4 | PDMS-PET based epidermal Optofluidic chip | 0.4 mM | 2.4 mM | <ul style="list-style-type: none"> • Wearable optofluidic patch for simultaneous detection of lactate, urea, and glucose in sweat. • Eliminates the need for plasmonic nanostructures for enhancement • Good repeatability even up to 90 days | <ul style="list-style-type: none"> • Lower Raman signal intensity compared to other SERS-based sensors • Need of microfluidic fabrication, increasing complexity • Concerns on adhesiveness on skin | Golparvar et al. ⁴ |
| 5 | Cotton fabric with Core-shell structured AuNR | - | 50 μ M | <ul style="list-style-type: none"> • wearable, thread-embroidered fabric microfluidic device for detection of lactate and glucose • Core-shell structured gold nanorods (AuNRs@Au) as SERS tags results in high sensitivity and reproducibility. • Successful validation on human volunteers at different body parts | <ul style="list-style-type: none"> • complex synthesis of core-shell AuNRs • fabric material may loose adhesion onto skin upon long term use • Relatively high complexity with need of embroidered microfluidic threads | Zhao et al. ⁵ |
| 6 | Au@PDMS/OA wearable adhesive patch (present work) | 55 μ M | 47 μ M | <ul style="list-style-type: none"> • Simple, biocompatible, wearable, adhesive and flexible patch, ensuring direct sweat absorption without the need for external microfluidic structures • Simple and optimized fabrication approach which is easily scalable with good batch repeatability • Nanoparticles in situ reduced onto cellulose fibers ensures reproducibility unlike colloidal NP based sensors | <ul style="list-style-type: none"> • Moderate and comparable LOD, but there is scope for improvement in terms of sensitivity • Validation on more clinical samples could ensure more reliability • Ideal for single use | Present work |
