List of Figures

Figure S1: Characterization of PVC-AMCD supporting the incorporation of AMCD-ZIF into the electrospun PVC membrane; a) SEM image with a water contact angle insert, b) Thermogravimetric analysis of PVC-AMCD relative to the pristine ZIF and membrane, and c) FTIR of the PVC-AMCD relative to the pristine membrane.	3
Figure S2: Removal efficiency of AMCD, PVC, and PVC-AMCD for: a) lead(II), b) silver(I), and c) cadmium(II) from water.....	3
Figure S3: The pseudo-second-order kinetic plot for the adsorption of: a) ($[\text{Ag(I)}] = 150 \text{ mg L}^{-1}$) on a 10 mg AMCD, b) ($[\text{Pb(II)}] = 150 \text{ mg L}^{-1}$) on a 10 mg AMCD, c) ($[\text{Cd(II)}] = 150 \text{ mg L}^{-1}$) on a 10 mg AMCD, d) ($[\text{Ag(I)}] = 150 \text{ mg L}^{-1}$) on a 10 mg PVC-AMCD membrane, e) ($[\text{Pb(II)}] = 150 \text{ mg L}^{-1}$) on a 10 mg PVC-AMCD membrane, f) ($[\text{Cd(II)}] = 150 \text{ mg L}^{-1}$) on a 10 mg PVC-AMCD membrane.	5
Figure S4: Reusability of PVC-AMCD for the adsorbed amount of Ag(I) and Pb(II).	7
Figure S5: SEM images of PVC-AMCD membrane before and after regeneration.	8
Figure S6: Filtration setup and PVC-AMCD membrane after filtration of multi-metal solution ..	8
Figure S7: Percentage removal of 4x4 cm PVC-AMCD membrane during the filtration of a multi-metal solution. The solution was left in contact with the membrane for 10 minutes	9
Figure S8: Real wastewater: a) before filtration and b) after filtration using PVC-AMCD membrane	9

List of Tables

Table S1: Removal efficiencies of AMCD, pristine PVC, and PVC-AMCD membrane in both homoionic and tertiary systems	4
Table S2: Parameters in the kinetic models of pseudo-second order.	4
Table S3: Comparison of maximum lead(II) adsorption capacity q_{max} (mg g^{-1}) of PVC-AMCD membrane with previously reported MOF/ZIF-based membranes	9

1. AMCD-ZIF incorporation and structural integrity of PVC-AMCD

Figure S1: Characterization of PVC-AMCD supporting the incorporation of AMCD-ZIF into the electrospun PVC membrane; a) SEM image with a water contact angle insert, b) Thermogravimetric analysis of PVC-AMCD relative to the pristine ZIF and membrane, and c) FTIR of the PVC-AMCD relative to the pristine membrane.

2. Removal efficiency of AMCD, PVC, and PVC-AMCD for heavy metals

Figure S2: Removal efficiency of AMCD, PVC, and PVC-AMCD for: a) lead(II), b) silver(I), and c) cadmium(II) from water.

Table S1: Removal efficiencies of AMCD, pristine PVC, and PVC-AMCD membrane in both homoionic and tertiary systems

Ionic system	Metal ions	Removal efficiency (%) after 24 hrs
--------------	------------	-------------------------------------

		AMCD	PVC	PVC-AMCD
Homoionic system	Pb(II)	86.0	25.4	48.3
	Ag(I)	78.8	11.9	77.5
	Cd(II)	63.9	7.0	41.9
Tertiary system	Pb(II)/Ag(I)/Cd(II)	100/52.5/43.3	2.1/2.9/0.85	100/26.4/31.3

3. Adsorption kinetics

The kinetic data were fitted with the pseudo-second-order kinetic model using the following equation (EQN S1):¹

$$\frac{t}{qt} = \frac{1}{K_2 q_e^2} + \frac{t}{q_e} \quad (\text{S1})$$

Where q_e (mg/g) and qt (mg/g) are the amount of metal ions adsorbed at equilibrium and at time t (min), respectively; t (min) is the adsorption time and K_2 (g/mg/min) is the pseudo-second-order adsorption rate constant.

Table S2: Parameters in the kinetic models of pseudo-second order.

	AMCD			PVC-AMCD		
Parameter	<i>Ag(I) ions</i>	<i>Pb(II) ions</i>	<i>Cd(II) ions</i>	<i>Ag(I) ions</i>	<i>Pb(II) ions</i>	<i>Cd(II) ions</i>
K_2 (g mg⁻¹ min⁻¹)	0.00158	0.00061	0.00017	0.00762	0.000125	0.000174
q_e (mg/g)	147.059	136.986	102.041	138.889	72.993	69.93
R_2	0.9998	0.9999	0.9968	1	0.9891	0.9927

Figure S3: The pseudo-second-order kinetic plot for the adsorption of: a) $[Ag(I)] = 150 \text{ mg L}^{-1}$ on a 10 mg AMCD, b) $[Pb(II)] = 150 \text{ mg L}^{-1}$ on a 10 mg AMCD, c) $[Cd(II)] = 150 \text{ mg L}^{-1}$ on a 10 mg AMCD, d) $[Ag(I)] = 150 \text{ mg L}^{-1}$ on a 10 mg PVC-AMCD membrane, e) $[Pb(II)] = 150 \text{ mg L}^{-1}$ on a 10 mg PVC-AMCD membrane, f) $[Cd(II)] = 150 \text{ mg L}^{-1}$ on a 10 mg PVC-AMCD membrane.

4. Adsorption isotherm

Adsorption equilibrium experiments were carried out with different initial concentrations of **heavy metal** ions ranging between 100 and 800 mg/L to assess the interaction between the adsorbate (metal ions) and the adsorbent (AMCD and PVC-AMCD). 10 mg of both adsorbents were immersed in each of the prepared solutions and were left in the shaker at a speed of 100 rpm at room temperature for 30 minutes. Aliquots were taken from the solutions, filtered

separately through a 0.45 µm filter syringe and analyzed by AAS. The amount of adsorbed metal ion at equilibrium, q_e (mg/g) was calculated by **EQN S2** ²:

$$q_e = \frac{(C_i - C_e)v}{w} \quad (\text{S2})$$

Where C_i and C_e (mg/L) are the initial and equilibrium concentrations of metal ion, respectively. Volume of the solution V (L), and W is the mass of adsorbent used (g). The experimental data were fitted into Langmuir and Freundlich isotherm models ³⁻⁵, which are mathematical models that describe the distribution of the adsorbate and adsorbent in aqueous solution according to the heterogeneity/homogeneity of the adsorbent, coverage type, and interaction between the adsorbate species.

4.1. Langmuir isotherm model

The Langmuir equation verifies a monolayer interaction between the adsorbate molecules onto the surface of the adsorbent. The linear form of this isotherm is represented by the expression :³

$$\frac{C_e}{q_e} = \frac{C_e}{q_{\max}} + \frac{1}{q_{\max}K_L} \quad (\text{S3})$$

Where q_e (mg/g) and C_e (mg/L) are the amount of adsorbed metal ions per unit weight of adsorbent and concentration of metal ions in solution at equilibrium, respectively. The constant K_L (L/g) is the Langmuir equilibrium constant related to the energy of adsorption and $q_{\max}$ is maximum adsorption capacity (mg/g). The essential feature of the Langmuir isotherm can be expressed in terms of a dimensionless constant called separation factor (R_L , also called equilibrium parameter) which is defined by the following equation:

$$R_L = \frac{1}{1 + K_L C_0} \quad (\text{S4})$$

Where C_0 (mg/L) is the initial adsorbate concentration. The value of R_L indicates the shape of the isotherms to be either unfavorable ($R_L > 1$), linear ($R_L = 1$), favorable ($0 < R_L < 1$) or irreversible ($R_L = 0$).

4.2. Freundlich isotherm model

The most important multisite adsorption isotherm for heterogeneous surfaces is the Freundlich adsorption isotherm, and the linear form of this isotherm is expressed as:⁵

$$\log q_e = \log k_f + \frac{1}{n} \log C_e \quad (S5)$$

Where q_e is the metal uptake (mg/g) at equilibrium, K_F is the measure of the sorption capacity, $1/n$ is the sorption intensity, and C_e is the final ion concentration in solution, or equilibrium concentration (mg/L). The Freundlich isotherm constants K_F and $1/n$ are evaluated from the intercept and the slope, respectively of the linear plot of $\log q_e$ versus $\log C_e$.

The value of n reflects the type of isotherm to be favorable ($0 < 1/n < 1$), irreversible ($1/n = 0$) or unfavorable ($1/n > 1$).

5. Regeneration and reusability of PVC-AMCD membrane

Figure S4: Reusability of PVC-AMCD for the adsorbed amount of Ag(I) and Pb(II).

Figure S5: SEM images of PVC-AMCD membrane before and after regeneration.

6. Rapid filtration performance of mixed contaminants

Figure S6: Filtration setup and PVC-AMCD membrane after filtration of multi-metal solution

Figure S7: Percentage removal of 4x4 cm PVC-AMCD membrane during the filtration of a multi-metal solution. The solution was left in contact with the membrane for 10 minutes

Figure S8: Real wastewater: a) before filtration and b) after filtration using PVC-AMCD membrane

7. Comparative analysis of adsorption capacities towards lead(II) ions

Table S3: Comparison of maximum lead(II) adsorption capacity $q_{\max}$ (mg g⁻¹) of PVC-AMCD membrane with previously reported MOF/ZIF-based membranes

MOF / ZIF - based membrane	$q_{\max}$ (mg g ⁻¹)	pH	Time (min)	Reference
ZIF-8 membrane on alumina support	115.38	7	120	6

UiO-66-NH ₂ PAN/chitosan nanofibers	441.2	2–7	5–90	7
HKUST-1 MOF on polyethersulfone (PES)	–	–	60	8
UiO-66-(COOH) ₂ in a PAN nanofibrous substrate (TFNC membrane, Ca-alginate skin)	254.5	–	–	9
UiO-66-(COOH) ₂ / PVC electrospun membrane	203	–	–	10
ZIF-8/ β -cyclodextrin in PVDF nanofibrous mixed-matrix membrane	708.13	–	–	11
ZIF-67/PVA Nanofibers Composite	140.3	6	120	12
MOF-on-nanofiber membranes (Fe/Zr-MOFs on PAN/PVDF) MOF 800	170.74	5	50	13
Versatile Mixed-Matrix Membranes Based on AMCD-ZIF and PVC for Sustainable Water Remediation	1666.7	7	30	This study
