Supplementary methods

X-ray diffraction (XRD). The XRD patterns were measured using a Bruker D2 PHASER diffractometer from Bruker Corporation, Germany. Cu-K α radiation was utilized, with a tube power of 2.2 kW. The initial scan range was set from 5° to 90°, with a scan rate of 6°/min. A fine scan ranged from 30° to 50° with a rate of 1°/min was also applied to better reveal the crystal structure.

Transmission electron microscopy (TEM). TEM images are collected using a JEM-F200. The transmission electron microscope (TEM) has a point resolution of ≤ 0.23 nm at 200 kV. The line resolution is ≤ 0.10 nm at 200 kV and ≤ 0.14 nm at 80 kV. For scanning transmission electron microscopy (STEM) with high-angle annular dark field (HAADF) imaging, the resolution is ≤ 0.16 nm at 200 kV and ≤ 0.34 nm at 80 kV. The information resolution is 0.12 nm at 200 kV. The acceleration voltage ranges from 80 kV to 200 kV. The magnification in TEM mode is from 20x to 2.0 Mx, while in STEM mode it is from 200x to 1.5 Mx. The electron gun type is a high-brightness cold field emission gun. The condenser lens system consists of a four-stage condenser lens system, allowing for independent control of the convergence angle and brightness. The detector types include bright field (BF), dark field (DF), and backscattered electron imaging (BEI).

Supplementary note 1. Derivation of the three-variable model

For the purpose of simplifying calculations, we first focus on examining the hydroformylation activity of the catalyst without distinguishing the types of aldehydes. With reference to lumped kinetics, 1-heptanal, 2-methylhexanal and 2-ethylbutanal are collectively referred to as aldehydes. The reaction pathway is simplified into two main steps: direct hydroformylation of 1-hexene to aldehydes and hydroformylation of 2-hexene (formed from the isomerization of 1-hexene) to aldehydes. Wherein, the kinetic constant of 1-hexene isomerization to 2-hexene is defined as k_{iso} , and the kinetic constants of 1-hexene and 2-hexene hydroformylation to aldehydes are defined as k_{HF1} and k_{HF2} , respectively.

The three-variable model can be then constructed as follow:

$$\begin{cases} \frac{dY_\alpha}{dt} = -(k_{iso} + k_{HF1})Y_\alpha \\ \frac{dY_\beta}{dt} = k_{iso}Y_\alpha - k_{HF2}Y_\beta \\ \frac{dY_{ald}}{dt} = k_{HF1}Y_\alpha + k_{HF2}Y_\beta \end{cases} \quad (7)$$

By solving these differential equations, we can obtain:

$$\begin{cases} Y_\alpha = \exp [(-k_{iso} - k_{HF1})t] \\ Y_\beta = \frac{k_{iso}}{k_{HF2} - k_{iso} - k_{HF1}} \exp [(-k_{iso} - k_{HF1})t] - \frac{k_{iso}}{k_{HF2} - k_{iso} - k_{HF1}} \exp (-k_{HF2}t) \\ Y_{ald} = \frac{k_{HF1} - k_{HF2}}{k_{HF2} - k_{iso} - k_{HF1}} \{ \exp [(-k_{iso} - k_{HF1})t] - 1 \} + \frac{k_{iso}}{k_{HF2} - k_{iso} - k_{HF1}} [\exp (-k_{HF2}t) - 1] \end{cases} \quad (8)$$

Using these equations, we can fit the experimental data, which is shown in **Fig. S3**. Although the Arrhenius fitting shows good linearity, the three-variable model can only predict the catalytic activity but cannot distinguish the regioselectivity of aldehydes.

Supplementary note 2. Formula for l/b prediction model

$$\begin{cases} \ln K_1 = \frac{4507}{T} + 0.96 \times \ln P - 13.59 \\ \ln K_2 = \frac{6347}{T} + 0.96 \times \ln P - 19.39 \\ \ln S = \frac{6386}{T} + \ln P - 19.11 \end{cases} \quad (9)$$

As can be seen from equation (9), K_1 , K_2 and S are both functions of T and P . From equation (5), it can be inferred that l/b ratio is also a function of T and P . Therefore, by giving a set of (T, P) , we can get the corresponding l/b ratio theoretically. According to this principle, by giving enough temperature and pressure, we get multiple sets of simulation results, and the predicted l/b ratio is supplemented in “Appendix B. Supplementary Data”. From this, the prediction chart is drawn.
