Section S1: General remarks

A positive pressure of nitrogen and oven dried glassware were used for all reactions. All solvents and starting materials were purchased from known chemical suppliers or available stores and used without any further purification unless specifically stipulated. The NMR spectra were obtained using a Bruker AV2 400 MHz or AVNEO 400 MHz spectrometer. The data was processed using TopSpin 4.1.4. software. NMR chemical shift values are reported in parts per million (ppm) and calibrated to the centre of the residual solvent peak set (s = singlet, br = broad, d = doublet, t = triplet, q = quartet, m = multiplet). Tensiometry measurements were undertaken using the Biolin Scientific Theta Attension optical tensiometer. The data was processed using Biolin OneAttension software. A Hamilton (309) syringe was used for these measurements. The melting point for each compound was measured using Stuart SMP10 melting point apparatus. High resolution mass spectrometry was performed using a Bruker microTOF-Q mass spectrometer and spectra recorded and processed using Bruker's Compass Data Analysis software. Infrared spectra were obtained using Shimadzu IR-Affinity-1 model Infrared spectrometer. The data was analysed in wavenumbers (cm^{-1}) using IRsolution software. DLS and Zeta Potential studies were carried out using an Anton Paar LitesizerTM 500 and processed using KalliopeTM professional software.

Section S2: Physicochemical methods

¹H NMR Diffusion Ordered Spectroscopy (DOSY): The hydrodynamic diameter was derived from diffusion rates obtained from ¹H NMR DOSY measurements using the Stokes-Einstein equation. The viscosity value used for the calculation was 0.00199 mPa (DMSO).

Quantitative ¹H NMR (qNMR) studies: A ¹H NMR spectrum was obtained with a delay ($d_1 = 60$ s) for compounds (112 mM) in DMSO- d_6 / 1.0 % DCM or 5.56 mM in D₂O/ 5.0 % EtOH. Through comparative integration of the anionic and cationic component signals against the internal standard signals (DCM/EtOH), the proportion of these molecular components to become 'lost' from solution, through the adoption of solid-like characteristics can be calculated.

Self-association constant calculation: Self-association constants were determined using Bindfit v0.5.¹ All the data can be accessed online using the hyperlinks provided.

Tensiometry studies: All the samples were prepared in an H₂O/5 % EtOH solution. All samples underwent an annealing process where they were heated to approximately 313 K before being left to cool to RT, enabling each sample to reach a thermodynamic minimum. All samples were prepared through serial dilution of the most concentrated sample. Three surface tension measurements were obtained for each sample at a given concentration using the pendant drop method. The average values were then used to calculate the CAC.

Mass spectrometry studies: Approximately 1 mg of each compound was dissolved in 1 mL of MeOH. This solution was further diluted 100-fold before undergoing analysis where 10 μL of each sample was injected directly into a flow of 10 mM ammonium acetate in 95 % water (flow rate = 0.02 mL/min).

Dynamic light scattering (DLS) studies: All solvents used were filtered to remove any particulates that may interfere with the results obtained. All samples underwent an annealing process, in which they were heated to 313 K before being left to cool to 298 K to allow each sample to reach a thermodynamic minimum. A series of 10 runs were recorded at 298 K.

Zeta potential studies: All solvents used were filtered to remove any particulates that may interfere with the results obtained. All samples underwent an annealing process in which they were heated to 313 K before being left to cool to 298 K to allow each sample to reach a thermodynamic minimum. The final zeta potential value given is an average of the number of experiments conducted at 298 K.

Crystal x-ray studies: Single crystals were produced through selective precipitation using chloroform and hexane. A suitable crystal was selected and mounted on a Rigaku Oxford Diffraction Supernova diffractometer. Data were collected using Cu K α radiation at 100 K. Structures were solved with the ShelXT or ShelXS structure solution programs via Direct Methods and refined with ShelXL by least Squares minimisation. Olex2 was used as an interface to all ShelX programs (CCDC 2122929).

Circular dichroism studies: All circular dichroism experiments were performed on the JASCO J-175 spectropolarimeter using a 1 mm pathlength quartz cuvette. Far UV-spectra were obtained between 200-260 nm with an average of 4 scans at 100 nm/min, 0.5 nm step resolution, 1.0 second response and 0.5 nm bandwidth. Samples were prepared between 1 mM in 400 μ L of H₂O/5 % EtOH.

Proton NMR spectroscopy titration studies: First 1.5 mL of a 0.01 M solution of receptor (SSA) was prepared. Of this solution, 0.5 mL was added to an NMR tube, which was then sealed with an airtight suba seal. The remaining 1.0 mL of the receptor solution was used to make a 0.15 M solution of the TBA salt of the anion. The anion/receptor solution was titrated into the NMR tube in small aliquots and a ¹H NMR spectrum taken after each addition. This allows the concentration of the anion in the NMR tube to increase whilst the concentration of receptor to remain constant. Chemical shifts for each ¹H NMR spectrum were recorded in ppm and calibrated to the solvent peak set. Bindfit v0.5 is then used to interpret the data to solve the binding constant(s).¹ Where SSAs are supplied as coformulations, they are present in a 1:1 molecular ratio, with the total molecular concentration equal to that of the of the experiment containing a single agent only.

Molecular modelling and simulation: Structures of the compounds were drawn in ChemDraw (version 22.0.0) and were imported into Chem3D (version 22.2.0). MM2 energy minimisations were run, giving the dipole-dipole energy and total energy in kcal/mol. The length of the compound was obtained by measuring the distance between the two atoms furthest away from each other, given in Å and converted to nm.

Low level in silico modelling: Computational calculations to identify primary hydrogen bond donating and accepting sites were conducted in line with studies reported by Hunter using Spartan 20 v1.1.4.² Calculations were performed using semi-empirical PM6 methods, after

energy minimisation calculations, to identify E_{\max} and E_{\min} values. PM6 was used over AM1 in line with research conducted by Stewart.³

Section S3: Biological methods

Ion transport studies

Preparation of vesicles: A stock solution of 1-palmitoyl-2-oleoyl-sn-glycero-3-phosphocholine (POPC) was prepared by dissolving 1 g of POPC in 35 mL de-acidified CHCl_3 . The CHCl_3 was passed through a column of basic alumina before use. This solution was stored at $-20\text{ }^\circ\text{C}$ when not in use.

A lipid film of POPC was prepared by adding 1–4 mL of the above stock solution into a pre-weighed falcon tube and gently removing the CHCl_3 under a stream of nitrogen. The lipid film was dried under vacuum overnight. The lipid film was re-hydrated by vortexing with the desired internal buffer solution, then subjected to 9 freeze-thaw cycles. Typically, the lipids were not thawed on the last cycle and were stored at $-20\text{ }^\circ\text{C}$ for use at a later date.

The lipid was thawed to room temperature and allowed to stand for 30 mins, then extruded 27 times through a 200 nm polycarbonate membrane. The resulting unilamellar vesicles were dialysed against the desired external buffer solution for a minimum of 2 hours.

Transport experiments protocol: The vesicles prepared as described above were diluted to a known volume of 5 mL using the desired external buffer solution. This solution was further diluted into individual 5 mL samples for testing at a final lipid concentration of 1 mM. The transporter was added to the vesicles from a stock solution in DMSO (5 mM) after 30 s in order to initiate the transport and any resulting chloride efflux was monitored using a chloride selective electrode (ISE – Cole Parmer). At the end of the experiment, the vesicles were lysed by the addition of 40 μL Triton-X 100 (10 wt% in H_2O). The final electrode reading was taken 2 mins later and used to calibrate 100% chloride efflux. Each experiment was performed 3 times.

MIC assay

Preparation of bacterial plates: Sterile TSB agar plates were streaked using the desired bacteria [*Staphylococcus aureus* (9144, 13616, USA 300 and 1199B), *Enterococcus faecalis* (NCTC 775 and 12201) and *Enterococcus faecium* (NCTC 12204)] and incubated at $37\text{ }^\circ\text{C}$ overnight.

Preparation of inoculum: An initial culture was made up by inoculating TSB (5 mL) with 3 single colonies of the desired bacteria under sterile conditions and incubated at $37\text{ }^\circ\text{C}$ overnight. The optical density at 600 nm (OD_{600}) was adjusted using sterile distilled H_2O (dH_2O) to equal $\sim 1 \times 10^6$ bacteria/mL.

Preparation of 96-well microplate: A solution of each compound in $\text{H}_2\text{O}/5\text{ }\%$ EtOH was made at a top concentration of 5.56 mM on the day of experiment. The compound solution (200 μL) was added to and diluted 50:50 down the plate. The bacterial suspension (100 μL) was dispensed into each well under sterile conditions. The plates were sealed using parafilm and incubated at $37\text{ }^\circ\text{C}$ for 20 hours, after which the OD_{600} was measured.

Scanning Electron Microscopy (SEM) studies

Sample preparation: Bacterial samples at 1×10^8 CFU/mL were treated for 10 minutes at 37 °C with 2 x MIC of SSA. Samples were then fixed using 2 % formaldehyde (48 % stock).

A drop of broth was left to settle overnight on to poly-L-lysine coated glass coverslips. The coverslips were then secondarily fixed in osmium tetroxide and then dehydrated through a graded ethanol series. Ethanol was replaced with two changes of hexamethyldisilazane (HMDS). Once dry, the coverslips were mounted onto aluminium stubs using sticky carbon disks. Stubs were gold coated with an Atom Tech ion beam coater.

Image collection and processing: SEM images were recorded using a Zeiss Sigma 300 VP, at 3 kV accelerating voltage, with a 6 mm working distance.

Haemolysis assay

Preparation of 96-well plate: Protocol modified from Travis et al.⁴ Heparinised human red blood cells collected from a volunteer and washed three times in PBS (pH 7.4). Compounds were serially diluted using PBS buffer across a 96-well V bottom Greiner plate. Negative control (100 μ L PBS), and positive control (100 μ L 0.1 % (v/v) Triton-X-100) were added to the plate. 100 μ L of 10 % (v/v) of blood suspension added to all wells. Plates were incubated for 60 minutes at 37 °C. After incubation, plates were centrifuged for 15 minutes at 4680 rpm. The resultant supernatant was then transferred to a 96-well flat bottom plate and absorbance read at 540 nm (Fluostar Omega). Percent haemolysis was calculated using the formula as shown in Equation S2.

Equation S2 - Percentage haemolysis calculation.

$$\text{Haemolysis (\%)} = \frac{A_{\text{sample}} - A_{\text{negative}}}{A_{\text{Triton}} - A_{\text{negative}}} \times 100$$

Toxicity assay

***G. mellonella* treatment assay:** *G. mellonella* larvae were purchased from Livefood UK Ltd. (Rooks Bridge, UK) and maintained on wood chips in the dark at 15 °C until use. *Galleria* larvae were injected with 10 μ L of compound in H₂O/5 % EtOH, incubated at 37 °C for 5 days and the deaths counted. Groups of 10 *Galleria* were injected per compound.

GI₅₀ determination assays

Cell culture: The RPE-1 retinal pigment epithelial, A2780 human ovarian carcinoma, and A2780 CisR cisplatin resistant human ovarian carcinoma cell lines were donated with thanks from the Institute of Cancer Research. The A2780 and A2780 CisR cell lines were cultured in IMDM supplemented with 10 % FBS at 37 °C and 5 % CO₂, while the RPE-1 cell line was cultured in a 1:1 mixture of Dulbecco's Modified Eagle Medium and Ham's F-12 Nutrient Mixture (DMEM/F-12) at 37 °C and 5 % CO₂.

SRB assay: Cells were seeded into 96-well plates at 800 cells per well/cpw (A2780), 1600 cpw (A2780 CisR) or 400 cpw (RPE-1) in cell culture medium and cultured for 48 hours followed by addition of each compound over an eight-point concentration range (each concentration in triplicate). Plates were then cultured for a further 96 hours, after which the cell culture

medium was removed from each well and the cells fixed with addition of 70 μL /well of 10 % (w/v) trichloroacetic acid (TCA) in distilled water followed by incubation for 30 minutes at RT. Each plate was then washed with distilled water five times before addition of 70 μL SRB dye (0.4 % (w/v) SRB dye (ThermoFisher Scientific, USA) solubilised in 1 % (v/v) acetic acid/ dH₂O) and incubated for 30 minutes at RT, followed by washing three times with 1 % (v/v) acetic acid and drying in a 37 °C oven overnight. Once dry, 100 μL of 10 mM Tris-base (ThermoFisher Scientific, USA) was added to each well and plates put on a microplate shaker for 10 minutes at 200 rpm to solubilize the dye. Absorbance values were then read at wavelength 490 nm on a Victor X4 multi-label plate reader (PerkinElmer Life Sciences, USA), data analysed using Microsoft Excel and graphs produced using GraphPad Prism 9.0 and the GI₅₀ value calculated.

Patch clamp studies

Solutions and compound preparation: All solvents and starting materials were purchased from known chemical suppliers. Compound stock solutions were prepared in DMSO. Buffer A consisted of KCl (489 mM) and NaOAc (5 mM) with a pH of 5.5 and an ionic strength of 500 mM. Buffer B consisted of Na₂SO₄ (167 mM) and NaOAc (5 mM) with a pH of 5.5 and an ionic strength of 500 mM.

Vesicle formation: Giant unilamellar Vesicles (GUVS) were prepared through the electro formation method using a Nanion VesiclePrepPro. A solution of 1,2-diphytanoyl-sn-glycero-3-phosphocholine (DPhPC) (10 mM) with 10 % cholesterol in chloroform (20 μL) was deposited onto an ITO coated glass surface (surface coated glass slide) and allowed to evaporate to create a dehydrated thin lipid film. A greased O-ring was then placed around the dehydrated lipid film to create a seal. This volume was then filled with a sucrose solution (275 μL , 200 mM) and then sealed with a second ITO coated glass slide. An AC current (3 V/5 Hz) was then applied. After 2 hrs, the voltage and frequency were reduced in steps over 30 mins to 1.6 V/1 Hz and held for 1 hr before being reduced to 0 V/0 Hz over a further 30 min period.

Patch clamp measurements: Experiments were performed using a Port-a-Patch system (Nanion Technologies) with borosilicate glass chips that contain an aperture diameter of approximately 1 μm . Buffer A (5 μL) was placed on the underside of the chip over the aperture, The chip was then placed into the port-a-patch system. Buffer A (15 μL) was then added to the top of the chip and 5 μL of the GUV stock solution added. The GUVS were the positioned over the aperture in the chip by application of negative pressure (-30 mbar). When a GUV is positioned over the aperture in the chip, it bursts, leaving a planar bilayer as a seal. The negative pressure is then removed, leaving the planar bilayer in place over the aperture. The external buffer A was the exchanged with buffer B, through four simultaneous buffer exchanges (4 x 15 μL). The holding potential was set to ± 50 or ± 100 mV depending on the experiment. The compound in a DMSO: buffer B 1:50 mixture (5 μL) was then added at $t = 30$ s, to give a final experimental concentration of 0.1 – 1 mM as appropriate. The number of sweeps was set to 1000, the sweep interval to 0.00 s, sample interval to 1.00 ms and the protocol was run for a total of 5 mins. Each experiment was repeated a minimum of three time to ensure reproducibility.

Data analysis: Initially the .asc files generated from the patch clamp experiment were curated into the format – internal_molecule_id/ experimental_conditions/ experiment_id/ files_ending_experiment_id.asc.

Files were read and converted from .asc files to csv files using Python scripts. The process combined all .asc files associated with an experiment into a single csv which can be read in and manipulated using Python. The experiments had been recorded at different resolutions; therefore, time rather than number of points has been used in the analysis. Two methods were used to categorise the time series patch clamp data into discrete states for analysis, method 1 (to get an understanding of the true baseline and small current changes) and method 2 (to get a macroscopic view of each experiment).

Method 1 involved finding the mean of the first 200 points for each experiment. The system was defined as being in an event state if a percentage of datapoints are above the baseline threshold (mean + standard deviation for each experiment). To do this, a convolution operation was applied to a masked version of the patch clamp current data with a vector containing only ones set to length 20. The masked version of the dataset set each datapoint 1 if the datapoint was above the baseline threshold and 0 if it was below. The convolution returned a look forward window with the number of points above and below the baseline which was converted to a percentage and checked against a threshold (set at 70 %). This set to 1 (event) if above and 0 (baseline) if below. Method 1 was used as a tool in analysis to pick and plot all events. These events were then post-processed and those events with a mean current below the standard deviation of the baseline or those that are too short-lived (less than 0.2 seconds by default) were removed.

Method 2 was a data binning approach used to classify the data into 4 event types (though these have been scaled for the variable current experiments) – 0: baseline ($-\infty$ A to $0.5e-10$ A), 1: events ($0.5e-10$ A to $5e-10$ A), 3: events where the current readings surpass the detector's measurable range ($4.9e-8$ A to ∞ A), and 2: events where current is between $5e-10$ A and $4.9e-8$ A. These current bins are as stated above for + 100 mV, halved for + 50 mV experiments, and made negative for -100 mV and for -50 mV. When the current is around the cutoffs, the noise causes the data to be categorised as above and below and threshold, these times are set to the minimum resolution of the experiment.

The data was processed using a PatchClampData class coded in Python which gives the ability to run these thresholding methods and generate the plots used within this paper and ESI. It has also allowed a summary table of the experiments including the total time of each experiment, the time in each event state and the bins used to threshold each experiment to be generated. The code for this project is available on GitHub - https://github.com/ta1u18/ssa_patch_clamp_data_analysis and original data, processed data and figures available as part of the supplementary information.

***In vitro* Absorption, Distribution and Metabolism studies**

General note: These studies were performed by Contract Research Organisation (CRO) Pharmaron. The methodology provided within the ESI is published within the express permission of this organisation. The percentage of a compound recovered during the analysis process should be 100 %; any deviation from this value indicates experimental limitations such as unintended potential non-specific binding events to experimental equipment, solubility issues, etc.

Protein Binding measurements in human plasma by using equilibrium dialysis:

The fraction unbound in human plasma (P-KB, Ltd People's hospital of Shandong) was measured using 96-well Equilibrium Dialysis Plate (HTDialysis LLC, Gales Ferry, CT). Human plasma containing 5 µM test compound was dialysed against dialysis buffer (PBS, pH 7.4) with initial samples taken to allow for assessment of plasma stability and recovery before the plate was incubated for 6 hours at 37°C at 5% CO₂. Samples were removed at 6 hours, and all samples were matrix matched and quenched with acetonitrile containing internal standard. Samples were centrifuged at 3,220g for 30 minutes to precipitate protein and enable sampling of supernatant prior to appropriate dilution for liquid chromatography mass-spectrometry (LC-MS/MS) analysis.

Samples were analysed using a Shimadzu Nexera LC Binary Gradient LC-30AD (Shimadzu Inc, Kyoto), coupled to a Sciex 6500+ (AB Inc., Illinois). Separation was achieved using a XSelect HSS T3 (2.5µm, 2.1 x 50 mm) (Waters Ltd., Wilmslow) column at a temperature of 40°C and a binary mobile phase gradient at a flow rate of 0.8 mL/min. Initial LC conditions comprised of 95% solvent A (0.1% formic acid in water), 5% solvent B (0.1% formic acid in acetonitrile); this was ramped to 98% B at 0.5 min, held for 0.4 min and then immediately returned to initial conditions. Sample analysis was by electrospray ionisation in combined with multiple reaction monitoring in positive ionisation mode. The ionisation voltage was +5500 V.

Kinetic Solubility Determination in PBS pH 7.4:

The stock solutions of test and control compounds were prepared in DMSO at 10 mM. From this a 300 µM solution was prepared in duplicate in 100 mM Phosphate Buffered Saline (PBS, pH 7.4 ± 0.1). These solutions were then shaken at 1100 rpm for 2 hours at 25°C. Following incubation, the samples were filtered using a vacuum manifold. The filtrate was analysed and quantified against a standard of known concentration using liquid chromatography mass-spectrometry (LC-MS/MS).

Samples were analysed using a Shimadzu Nexera LC Binary Gradient LC-30AD (Shimadzu Inc, Kyoto), coupled to a Sciex 4500 mass spectrometer (AB Inc., Illinois). Separation of compounds was achieved using an XSelect HSS T3 column (2.5µm, 50 x 2.1 mm) (Waters Ltd., Wilmslow) at a temperature of 40°C and a binary mobile phase gradient at a flow rate of 0.8 mL/min. Initial LC conditions comprised of 95% solvent A (0.1% formic acid in water) and 5% solvent B (0.1% formic acid in acetonitrile). This was ramped to 98% solvent B at 0.5 minutes, held for 0.4 minutes and then immediately returned to initial conditions. Sample analysis was by electrospray ionisation combined with multiple reaction monitoring in positive ion mode. The ionspray voltage was 5500V.

Metabolic Stability in Rat, Mouse and Human Liver Microsomes:

The metabolic stability of compounds at a concentration of 1 μ M, in rat, mouse and human liver microsomes (BD Gentest, Franklin Lakes NJ) was measured following incubation with hepatic microsomes (0.5 mg of protein / mL) in the presence and absence of cofactor (NADPH) at 37 °C. Aliquots of each incubation were removed at 0.5, 5, 15, 30 and 60 minutes. The reaction was stopped by the addition of cold acetonitrile containing analytical internal standard (IS).

Samples were then centrifuged at 3,220 g for 40 minutes. The supernatant was aliquoted and added to ultra-pure H₂O in a 1:1 ratio in preparation for LC-MS/MS analysis. Incubations were conducted in duplicate; control incubations (substituting PBS for NADPH) were conducted simultaneously. All control incubations were within acceptance criteria in mouse, rat, and human microsomes confirming stability was acceptable over 60 minutes in the absence of co-factor.

Samples were analysed using a Shimadzu Shimadzu Nexera LC Binary Gradient LC-30AD (Shimadzu Inc, Kyoto), coupled to a Sciex 5500 mass spectrometer (AB Inc., Illinois) for rat and mouse microsomes and a Sciex 6500+ for human microsomes. Separation achieved using an XSelect HSS T3 column (2.5 μ m, 50 x 2.1 mm) (Waters Ltd., Wilmslow) at a temperature of 40°C and a binary mobile phase gradient at a flow rate of 0.7 mL/min. Initial LC conditions comprised of 95% solvent A (0.1% formic acid in water) and 5% solvent B (0.1% formic acid in acetonitrile). This was ramped to 95% solvent B at 0.7 minutes, held for 0.5 minutes and then immediately returned to initial conditions. Sample analysis was by electrospray ionisation combined with multiple reaction monitoring in positive ion mode. The ionspray voltage was 5500V.

Bi-directional Permeability in Caco-2 Cell Line:

The bi-directional permeability in Caco-2 cell lines was determined by seeding cells onto an HTS Transwell plate. Cells were cultivated for 14-18 days in a cell culture incubator at 37°C, 5% CO₂, 95% relative humidity. Cell culture medium was replaced every other day. To assess monolayer integrity the transepithelial electrical resistance (TEER) across the monolayer was measured using Millicell Epithelial volt-ohm meter prior to assay and Lucifer yellow (LY) fluorescence measurement post-assay.

Test compound was prepared in DMSO and diluted in Hank's Balanced Saline Solution (HBSS, pH 7.4) to a final concentration of 5 μ M. Compound was added to the donor compartment of the transwell plate for both apical to basolateral (A>B) and basolateral to apical (B>A) measurements, with blank HBSS being added to the receiver compartment. The transwell plate was then incubated at 37°C, 5% CO₂ for 2 hours.

Samples were taken at T=0 and T=2 hours determine the concentration of initial donor sample, and the concentration of receiver and donor wells post-incubation, respectively. The samples were quenched with solvent containing internal standard (IS). The supernatant was mixed with an appropriate volume of ultra-pure water before LC-MS/MS analysis.

Samples were analysed using a Shimadzu Nexera LC Binary Gradient LC-30AD (Shimadzu Inc, Kyoto), coupled to a Sciex 6500+ (AB Inc., Illinois). Separation of compounds was achieved using a HALO 90Å biphenyl (2.7µm, 2.1x50mm) (Advanced Materials Technology, Wilmington) column at a temperature of 40°C. A binary mobile phase gradient at a flow rate of 0.7 mL/min was used. Initial LC conditions comprised of 95% solvent A (0.1% formic acid in water) and 5% solvent B (0.1% formic acid in acetonitrile). This was ramped to 95% solvent B at 0.7 minutes, held for 0.5 minutes and then immediately returned to initial conditions. Sample analysis was by electrospray ionisation combined with multiple reaction monitoring in positive ion mode. The ion spray voltage was 5500V.

In vitro Absorption, Distribution and Metabolism results

The summary of *in vitro* results is shown in Tables S1-S4.

Table S1 – Result from solubility assays performed in PBS pH 7.4 for SSA 9.

ID	Solubility (µM)
SSA 9	271

Table S2 – Summary of results from Caco-2 permeability assays for SSA 9. P_{app} is given as $\times 10^{-6}$ cm/s. Low P_{app} = $< 5 \times 10^{-6}$ cm/s; Moderate P_{app} = $5-10 \times 10^{-6}$ cm/s; High P_{app} = $> 10 \times 10^{-6}$ cm/s. A = apical; B = basolateral. Recovery = % SSA recovered from the assay after 2 hours.

ID	P_{app} (A-B)	% Recovery	P_{app} (B-A)	% Recovery	Efflux Ratio
SSA 9	0.17	110.8	16.8	97.7	96.9

Table S3 – Summary of results from human plasma protein binding assays for SSA 9. % Bound = % of SSA bound to the plasma proteins after 6 hours incubation at 37 °C. Low % Bound = < 80 %; Moderate % Bound = $80-95$ %; High % Bound = $95-99$ %; Very high % Bound = > 99 %. % Recovery = % SSA recovered from the assay after 6 hours.

ID	% Bound	% Recovery	% Stability
SSA 9	99.7	98.3	98.9

Table S4 – Summary of results from mouse, rat and human microsomal stability assays for SSA 9. The *in vitro* half-life ($t_{1/2}$) and microsomal intrinsic clearance (CL_{int}) were calculated from the elimination rate (k , the slope of the natural log of concentration versus time curve), assuming first order kinetics, using the formulae $t_{1/2} = 0.693/-k$ and $CL_{int} = 0.693/t_{1/2} \times$ microsomal protein concentration. This compound would be classed as a low clearance compound in all three species.

ID	Mouse		Rat		Human

Section S4: Chemical structures

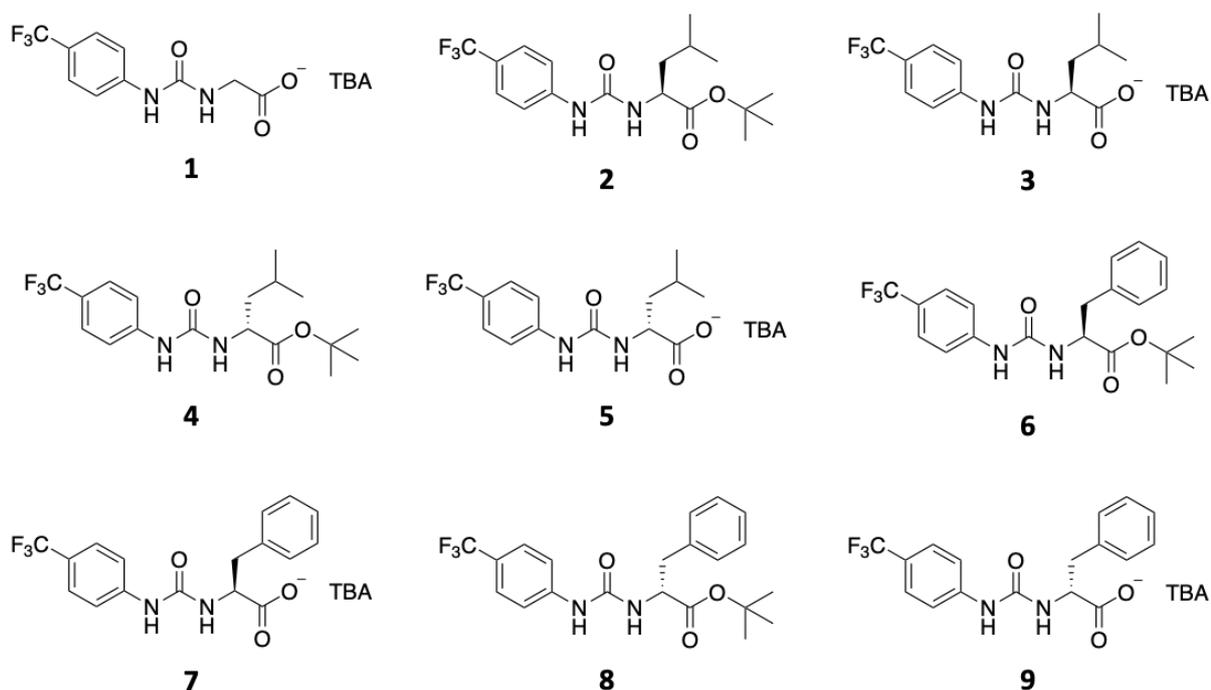

Figure S1 - Chemical structures of **1** - **9**. TBA = tetrabutylammonium.

Section S5: Chemical synthesis

Compound 1: This was synthesised in line with previously published methods.⁵ ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ : 10.27 (s, 1H), 7.68 (d, *J* = 8.60 Hz, 2H), 7.50 (d, *J* = 8.60 Hz, 2H), 6.75 (s, 1H), 3.18 - 3.13 (m, 8H), 1.60 - 1.52 (m, 8H), 1.34 - 1.25 (m, 8H), 0.93 (t, *J* = 14.64 Hz, 12H).

Compound 2: 1-Isocyanato-4-(trifluoromethyl) benzene (0.29 mL, 2.00 mmol) was added to L-Leucine *tert*-butyl ester hydrochloride (0.45 g, 2 mmol) in anhydrous pyridine (10 mL) and stirred at room temperature overnight. The mixture was then taken to complete dryness and redissolved in chloroform (5 mL), followed by dropwise additions of hexane (> 5 mL) resulting in precipitation. The precipitate was collected via filtration and purified via flash column chromatography with a 3:2 mixture of hexane to ethyl acetate. All fractions were monitored using thin layer chromatography and were taken to complete dryness. The pure product was identified using NMR spectroscopy and collected as a white solid with a yield of 53 % (0.40 g, 1.07 mmol); melting point: > 200 °C; ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ : 8.96 (s, 1H), 7.57 (s, 4H), 6.55 (d, *J* = 8.12 Hz, 1H), 4.13 (q, *J* = 22.92 Hz, 1H), 1.71 - 1.62 (m, 1 H), 1.54 - 1.48 (m, 2H), 1.41 (s, 9H), 0.91 (q, *J* = 18.80 Hz, 6H); ¹³C{¹H} NMR (100 MHz, 298 K, DMSO-*d*₆): δ : 172.8 (C=O), 154.9 (C=O), 144.3 (ArC), 126.5 (q, *J* = 3.81 Hz, ArCH), 123.7 (ArC), 121.7 (q, *J* = 31.78 Hz, CF₃), 117.7 (ArCH), 81.1 (C), 51.9 (CH), 41.3 (CH₂), 28.1 (CH), 24.9 (CH₃), 23.1 (CH₃), 22.1 (CH₃); IR (film): ν = 3338 (NH stretch), 2958, 1701, 1680, 1527, 1332, 1315, 1155, 1105, 1066, 833, 607; HRMS for the carboxylate-urea ion (C₁₄H₁₆F₃N₂O₃⁻); HRMS

for the *tert*-butyl carboxylate-urea ($C_{18}H_{25}F_3N_2O_3$) (ESI^-): m/z : act = 374.1739 [M]⁻, cal = 374.1817 [M]⁻.

Compound 3: Zinc bromide (2.25 g, 10 mmol) was added to **2** (0.40 g, 1.07 mmol) in dichloromethane (5 mL) and stirred at room temperature for 24 hours. The reaction mixture was then quenched with water (20 mL) and stirred at room temperature for 4 hours, resulting in precipitation. The precipitate was collected via filtration and TBA hydroxide in methanol (0.51 mL, 1 M) was added. The mixture was taken to dryness, and the pure product was collected via flash column chromatography with 100 % ethyl acetate followed by 100 % methanol. The methanol fraction was taken to dryness to give the pure product as a brown solid with a yield of 62 % (0.25 g, 0.45 mmol); melting point: 131 °C; ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ: 9.85 (s, 1H), 7.65 (d, *J* = 8.48 Hz, 2H), 7.49 (d, *J* = 8.40 Hz, 2H), 6.74 (s, 1H), 3.74 (q, *J* = 18.80 Hz, 1H), 3.19 – 3.14 (m, 8H), 1.74 – 1.67 (m, 1H), 1.61 – 1.48 (m, 9H), 1.40 – 1.24 (m, 9H), 0.96 – 0.84 (m, 18H); ¹³C{¹H} NMR (100 MHz, 298 K, DMSO-*d*₆): δ: 174.9 (C=O), 155.4 (C=O), 146.3 (ArC), 125.9 (d, *J* = 3.84 Hz, ArCH), 124.0 (ArC), 119.9 (q, *J* = 31.44 Hz, CF₃), 117.2 (ArCH), 58.0 (CH₂), 54.2 (CH), 44.6 (CH₂), 25.0 (CH₃), 23.7 (CH₃), 23.5 (CH₂), 23.4 (CH₃), 19.6 (CH₂), 13.9 (CH₃); IR (film): ν = 3311 (NH stretch), 2960, 1697, 1604, 1319, 1105, 1064, 842; HRMS for the carboxylate-urea ion ($C_{14}H_{16}F_3N_2O_3^-$) (ESI^-): m/z : act = 317.1110 [M]⁻, cal = 317.1118 [M]⁻.

Compound 4: 1-Isocyanato-4-(trifluoromethyl) benzene (0.29 mL, 2.00 mmol) was added to D-Leucine *tert*-butyl ester hydrochloride (0.45 g, 2 mmol) in anhydrous pyridine (10 mL) and stirred at room temperature overnight. The mixture was then taken to complete dryness and redissolved in chloroform (5 mL), followed by dropwise additions of hexane (> 5 mL) resulting in precipitation. The precipitate was collected via filtration and purified via flash column chromatography with a 3:2 mixture of hexane to ethyl acetate. All fractions were monitored using thin layer chromatography and were taken to complete dryness. The pure product was identified using NMR spectroscopy and collected as a white solid with a yield of 75 % (0.56 g, 1.50 mmol); melting point: > 200 °C; ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ: 8.96 (s, 1H), 7.57 (s, 4H), 6.55 (d, *J* = 8.12 Hz, 1H), 4.13 (q, *J* = 22.76 Hz, 1H), 1.70 – 1.62 (m, 1 H), 1.52 – 1.48 (m, 2H), 1.41 (s, 9H), 0.91 (q, *J* = 18.72 Hz, 6H); ¹³C{¹H} NMR (100 MHz, 298 K, DMSO-*d*₆): δ: 172.8 (C=O), 154.9 (C=O), 144.3 (ArC), 126.5 (q, *J* = 3.82 Hz, ArCH), 123.7 (ArC), 121.7 (q, *J* = 31.78 Hz, CF₃), 117.7 (ArCH), 81.1 (C), 51.9 (CH), 41.3 (CH₂), 28.1 (CH₃), 24.9 (CH₃), 23.1 (CH₃), 22.1 (CH₃); IR (film): ν = 3338 (NH stretch) 2958, 1703, 1680, 1529, 1332, 1315, 1155, 1107, 1066, 833, 609; HRMS for the *tert*-butyl carboxylate-urea ($C_{18}H_{25}F_3N_2O_3$) (ESI^-): m/z : act = 374.1763 [M]⁻, cal = 374.1817 [M]⁻.

Compound 5: Zinc bromide (2.25 g, 10 mmol) was added to **4** (0.56 g, 1.50 mmol) in dichloromethane (5 mL) and stirred at room temperature for 24 hours. The reaction mixture was then quenched with water (20 mL) and stirred at room temperature for 4 hours, resulting in precipitation. The precipitate was collected via filtration and TBA hydroxide in methanol (0.51 mL, 1M) was added. The mixture was taken to dryness, and the pure product was collected via flash column chromatography with 100 % ethyl acetate followed by 100 % methanol. The methanol fraction was taken to dryness to give the pure product as a brown solid with a yield of 68 % (0.38 g, 0.68 mmol); melting point: 120 °C; ¹H NMR (400

MHz, 298 K, DMSO- d_6): δ : 10.01 (s, 1H), 7.67 (d, J = 8.28 Hz, 2H), 7.49 (d, J = 8.60 Hz, 2H), 6.81 (s, 1H), 3.75 (q, J = 18.64 Hz, 1H), 3.19 – 3.14 (m, 8H), 1.75 – 1.66 (m, 1H), 1.61 – 1.48 (m, 9H), 1.41 – 1.24 (m, 9H), 0.96 – 0.85 (m, 18H); $^{13}\text{C}\{^1\text{H}\}$ NMR (100 MHz, 298 K, DMSO- d_6): δ : 175.0 (C=O), 155.4 (C=O), 146.3 (ArC), 125.9 (d, J = 3.9 Hz, ArCH), 121.7 (q, J = 31.48 Hz, CF_3), 117.2 (ArCH), 58.0 (CH_2), 54.2 (CH), 44.5 (CH_2), 25.0 (CH_3), 23.7 (CH_3), 23.5 (CH_2), 23.4 (CH_3), 19.6 (CH_2), 13.9 (CH_3); IR (film): ν = 3309 (NH stretch), 2960, 1697, 1606, 1319, 1107, 1066, 846; HRMS for the carboxylate-urea ion ($\text{C}_{14}\text{H}_{16}\text{F}_3\text{N}_2\text{O}_3^-$) (ESI $^-$): m/z : act = 317.1160 [M] $^-$, cal = 317.1118 [M] $^-$.

Compound 6: 1-Isocyanato-4-(trifluoromethyl) benzene (0.29 mL, 2.00 mmol) was added to a stirring solution of L-Phenylalanine *tert*-butyl ester hydrochloride (0.52 g, 2 mmol) in anhydrous pyridine (10 mL) and left at room temperature overnight. The mixture was then taken to complete dryness and redissolved in chloroform (5 mL), followed by dropwise additions of hexane (> 5 mL) resulting in precipitation. The precipitate was collected via filtration and purified via flash column chromatography with a 3:2 mixture of hexane to ethyl acetate. All fractions were monitored using thin layer chromatography and were taken to complete dryness. The pure product was identified using NMR spectroscopy and collected as a white solid with a yield of 61 % (0.50 g, 1.22 mmol); melting point: > 200 °C; ^1H NMR (400 MHz, 298 K, DMSO- d_6): δ : 9.10 (s, 1H), 7.56 (s, 4H), 7.33 - 7.20 (m, 5H), 6.52 (d, J = 7.52 Hz, 1H), 4.41 (q, J = 20.64 Hz, 1H), 2.99 (d, J = 5.04 Hz, 2H), 1.35 (s, 9H); $^{13}\text{C}\{^1\text{H}\}$ NMR (100 MHz, 298 K, DMSO- d_6): δ : 171.5 (C=O), 154.7 (C=O), 144.2 (ArC), 137.2 (ArC), 129.8 (ArCH), 128.7 (ArCH), 127.0 (ArCH), 126.4 (q, J = 3.77 Hz, ArCH), 121.5 (q, J = 31.75 Hz, CF_3), 123.7 (ArC), 117.7 (ArCH), 81.4 (C), 54.6 (CH), 37.9 (CH_2), 28.0 (CH_3); IR (film): ν = 3381 (NH stretch), 2987, 1681, 1535, 1327, 1315, 1234, 1159, 1107, 1066, 835, 700, 609; HRMS for the *tert*-butyl carboxylate-urea ($\text{C}_{21}\text{H}_{23}\text{F}_3\text{N}_2\text{O}_3$) (ESI $^-$): m/z : act = 408.1227 [M] $^-$, cal = 408.1661 [M] $^-$.

Compound 7: Zinc bromide (2.25 g, 10 mmol) was added to a stirring solution of **6** (0.50 g, 1.22 mmol) in dichloromethane (5 mL) and stirred at room temperature for 24 hours. The reaction mixture was then quenched with water (20 mL) and stirred at room temperature for 4 hours, resulting in precipitation. The precipitate was collected via filtration and TBA hydroxide in methanol (0.51 mL, 1M) was added. The mixture was taken to dryness, and the pure product was collected via flash column chromatography with 100 % ethyl acetate followed by 100 % methanol. The methanol fraction was taken to dryness to give the pure product as a brown solid with a yield of 54 % (0.27 g, 0.45 mmol); melting point: 160 °C; ^1H NMR (400 MHz, 298 K, DMSO- d_6): δ : 9.81 (s, 1H), 7.64 (d, J = 8.64 Hz, 2H), 7.49 (d, J = 8.64 Hz, 2H), 7.15 - 7.04 (m, 5H), 6.61 (d, J = 5.12 Hz, 1H), 3.96 (q, J = 15.92 Hz, 1H), 3.17 - 2.97 (m, 10 H), 1.60 – 1.51 (m, 8H), 1.34 – 1.25 (m, 8H), 0.92 (t, J = 14.64 Hz, 12H); $^{13}\text{C}\{^1\text{H}\}$ NMR (100 MHz, 298 K, DMSO- d_6): δ : 173.2 (C=O), 155.2 (C=O), 146.0 (ArC), 140.3 (ArC), 130.1 (ArCH), 128.0 (ArCH), 126.0 (q, J = 3.75 Hz, ArCH), 125.8 (ArCH), 124.0 (ArC), 120.2 (q, J = 31.55 Hz, CF_3), 117.2 (ArCH), 57.9 (t, J = 2.5 Hz, CH_2), 56.7 (CH), 39.1 (CH_2), 23.5 (CH_2), 19.7 (CH_2), 13.9 (CH_3); IR (film): ν = 3419 (NH stretch), 2964, 1695, 1591, 1485, 1394, 1319, 1109, 1064, 846, 705; HRMS for the carboxylate-urea ion ($\text{C}_{17}\text{H}_{14}\text{F}_3\text{N}_2\text{O}_3^-$) (ESI $^-$): m/z : act = 351.0952 [M] $^-$, cal = 351.0962 [M] $^-$.

Compound 8: 1-Isocyanato-4-(trifluoromethyl) benzene (0.29 mL, 2.00 mmol) was added to D-phenylalanine *tert*-butyl ester hydrochloride (0.52 g, 2 mmol) in anhydrous pyridine (10 mL) and stirred at room temperature overnight. The mixture was then taken to complete dryness and redissolved in chloroform (5 mL), followed by dropwise additions of hexane (> 5 mL) resulting in precipitation. The precipitate was collected via filtration and purified via flash column chromatography with a 3:2 mixture of hexane to ethyl acetate. All fractions were monitored using thin layer chromatography and were taken to complete dryness. The pure product was identified using NMR spectroscopy and collected as a white solid with a yield of 62 % (0.51 g, 1.25 mmol); melting point: 166 °C; ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ: 9.10 (s, 1H), 7.56 (s, 4H), 7.33 – 7.21 (m, 5H), 6.53 (d, *J* = 8.12 Hz, 1H), 4.41, (q, *J* = 21.40 Hz, 1H), 3.00 (d, *J* = 6.88 Hz, 2H), 1.35 (s, 9H); ¹³C{¹H} NMR (100 MHz, 298 K, DMSO-*d*₆): δ: 171.5 (C=O), 154.7 (C=O), 144.3 (ArC), 137.3 (ArC), 129.8 (ArCH), 128.7 (ArCH), 127.1 (ArCH), 126.5 (q, *J* = 3.79 Hz, ArCH), 121.8 (q, *J* = 31.78 Hz, CF₃), 123.7 (ArC), 117.7 (ArCH), 81.5 (C), 54.6 (CH), 38.0 (CH₂), 28.0 (CH₃); IR (film): ν = 3381 (NH stretch), 2985, 1681, 1537, 1328, 1317, 1236, 1159, 1107, 1066, 835, 700, 609; HRMS for the *tert*-butyl carboxylate-urea (C₂₁H₂₃F₃N₂O₃) (ESI⁻): *m/z*: act: 408.1502 [M]⁻ cal: 408.1661 [M]⁻.

Compound 9: Zinc bromide (2.25 g, 10 mmol) was added to **8** (0.51 g, 1.25 mmol) in dichloromethane (5 mL) and stirred at room temperature for 24 hours. The reaction mixture was then quenched with water (20 mL) and stirred at room temperature for 4 hours, resulting in precipitation. The precipitate was collected via filtration and TBA hydroxide in methanol (0.51 mL, 1M) was added. The mixture was taken to dryness, and the pure product was collected via flash column chromatography with 100 % ethyl acetate followed by 100 % methanol. The methanol fraction was taken to dryness to give the pure product as a brown solid with a yield of 54 % (0.28 g, 0.47 mmol); melting point: > 200 °C; ¹H NMR (400 MHz, 298 K, DMSO-*d*₆): δ: 9.71 (s, 1H), 7.63 (d, *J* = 8.60 Hz, 2H), 7.50 (d, *J* = 8.72 Hz, 2H), 7.31 - 7.05 (m, 5H), 6.57 (s, 1H), 3.87 (q, *J* = 14.44 Hz, 1H), 3.18 – 2.98 (m, 10 H), 1.60 – 1.51 (m, 8H), 1.35 – 1.25 (m, 8H), 0.93 (t, *J* = 14.88 Hz, 12H); ¹³C{¹H} NMR (100 MHz, 298 K, DMSO-*d*₆): δ: 173.2 (C=O), 155.2 (C=O), 146.0 (ArC), 140.2 (ArC), 130.1 (ArCH), 128.0 (ArCH), 126.0 (q, *J* = 3.62 Hz, ArCH), 125.8 (ArCH), 124.0 (ArC), 120.2 (q, *J* = 31.54 Hz, CF₃), 117.3 (ArCH), 58.0 (t, *J* = 2.46 Hz, CH₂), 56.7 (CH), 39.1 (CH₂), 23.5 (CH₂), 19.7 (CH₂), 13.9 (CH₃); IR (film): ν = 3309 (NH stretch), 2962, 1695, 1606, 1489, 1381, 1319, 1107, 1066, 846, 702; HRMS for the carboxylate-urea ion (C₁₇H₁₄F₃N₂O₃⁻) (ESI⁻): *m/z*: act: 351.0937 [M]⁻ cal: 351.0962 [M]⁻.

Section S7: Quantitative ^1H NMR studies

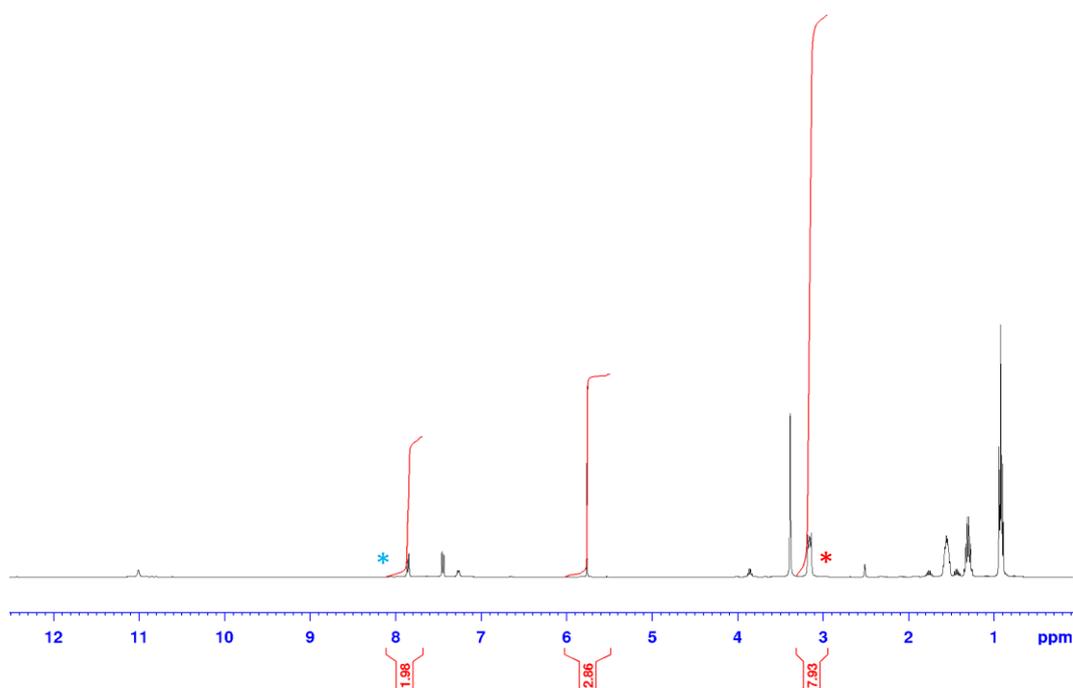

Figure S19 - ^1H NMR spectrum ($d_1 = 60$ s) of **3** (112 mM) in $\text{DMSO-}d_6/1.0\%$ DCM. Comparative integration indicates 0 % of the anionic component (blue) and 0 % of the cationic component (red) of **3** has become NMR silent.

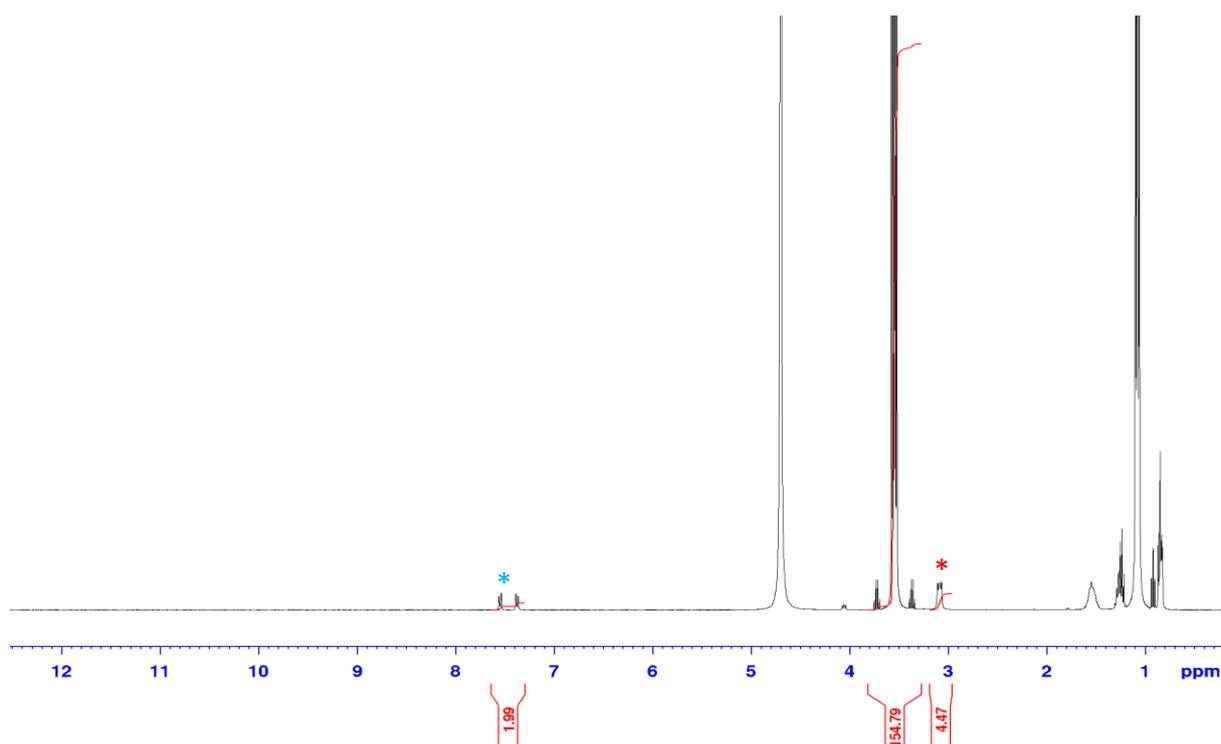

Figure S20 - ^1H NMR spectrum ($d_1 = 60$ s) of **3** (5.56 mM) in $\text{D}_2\text{O}/ 5.0\%$ EtOH. Comparative integration indicates 50 % of the anionic component (blue) and 44 % of the cationic component (red) of **3** has become NMR silent.

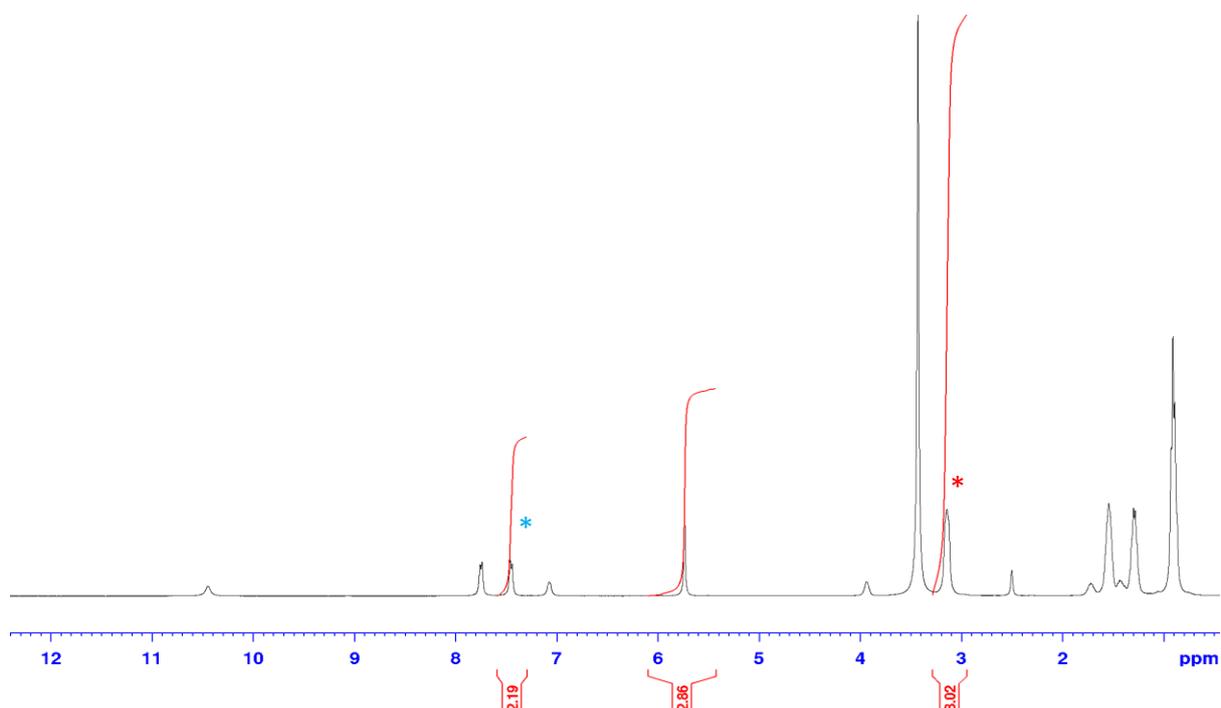

Figure S21 - ^1H NMR spectrum ($d_1 = 60$ s) of **5** (112 mM) in $\text{DMSO-}d_6/ 1.0\%$ DCM. Comparative integration indicates 0 % of the anionic component (blue) and 0 % of the cationic component (red) of **5** has become NMR silent.

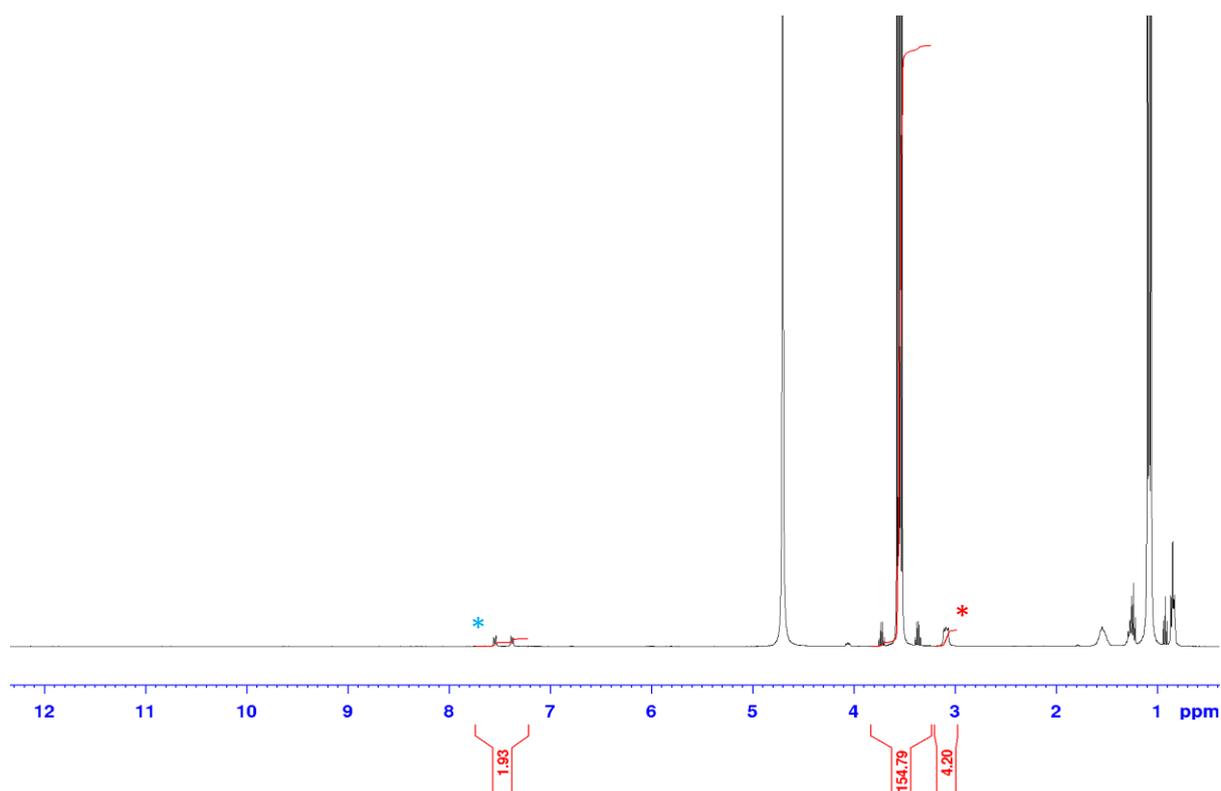

Figure S22 - ^1H NMR spectrum ($d_1 = 60$ s) of **5** (5.56 mM) in $\text{D}_2\text{O}/5.0\%$ EtOH. Comparative integration indicates 52 % of the anionic component (blue) and 48 % of the cationic component (red) of **5** has become NMR silent.

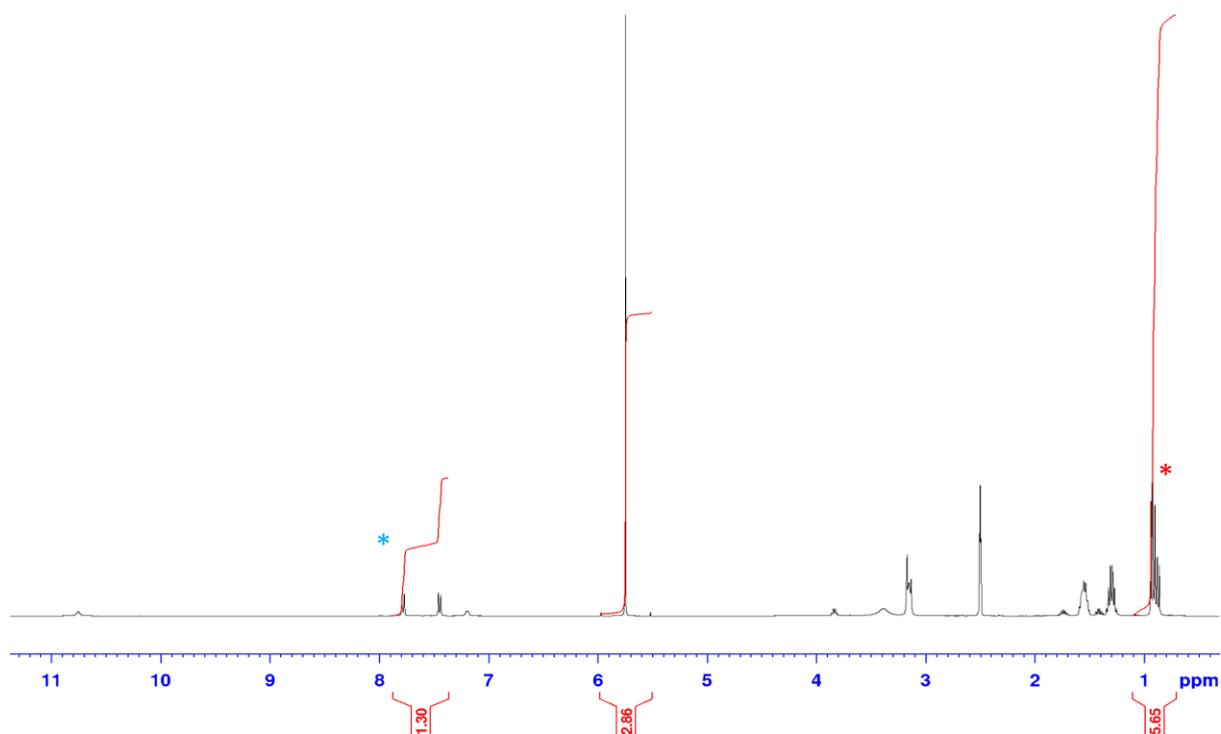

Figure S23 - ^1H NMR spectrum ($d_1 = 60$ s) of **3 + 5** (112 mM) in $\text{DMSO-}d_6/1.0\%$ DCM. Comparative integration indicates 68 % of the anionic component (blue) and 69 % of the cationic component (red) has become NMR silent.

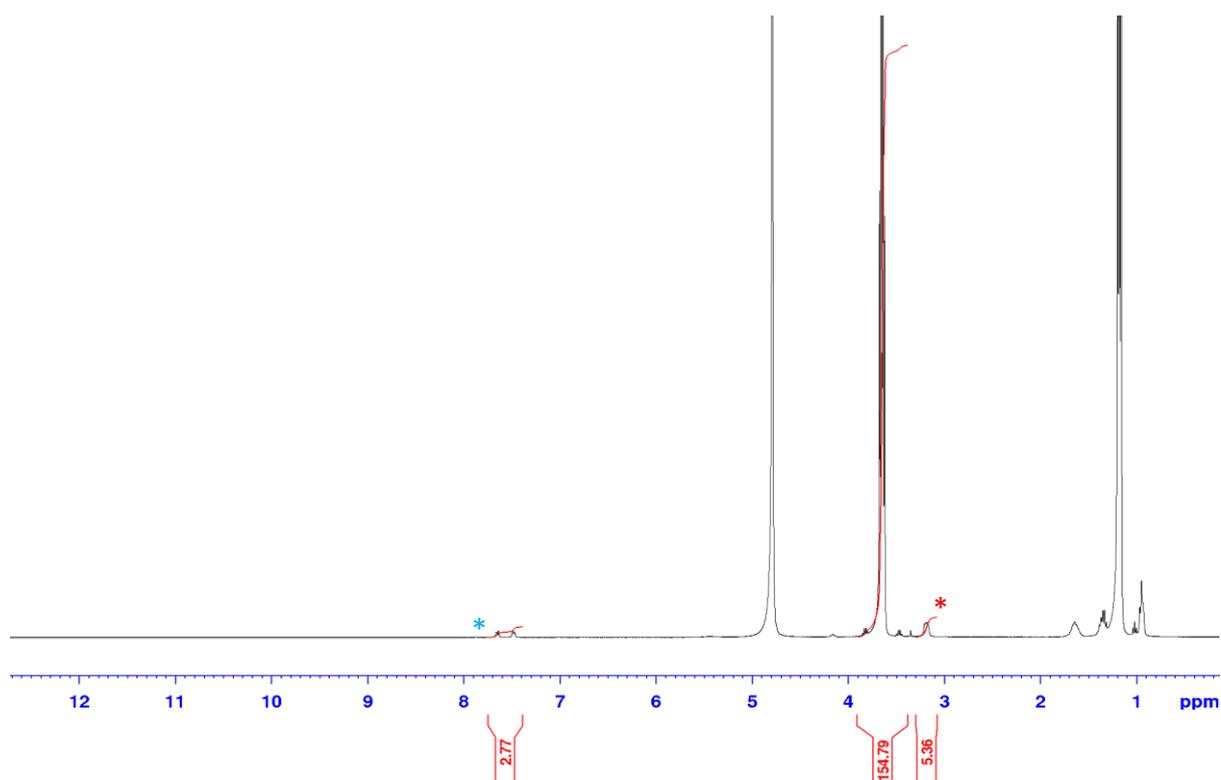

Figure S24 - ^1H NMR spectrum ($d_1 = 60$ s) of **3** + **5** (5.56 mM) in $\text{D}_2\text{O}/5.0\%$ EtOH. Comparative integration indicates 31 % of the anionic component (blue) and 33 % of the cationic component (red) has become NMR silent.

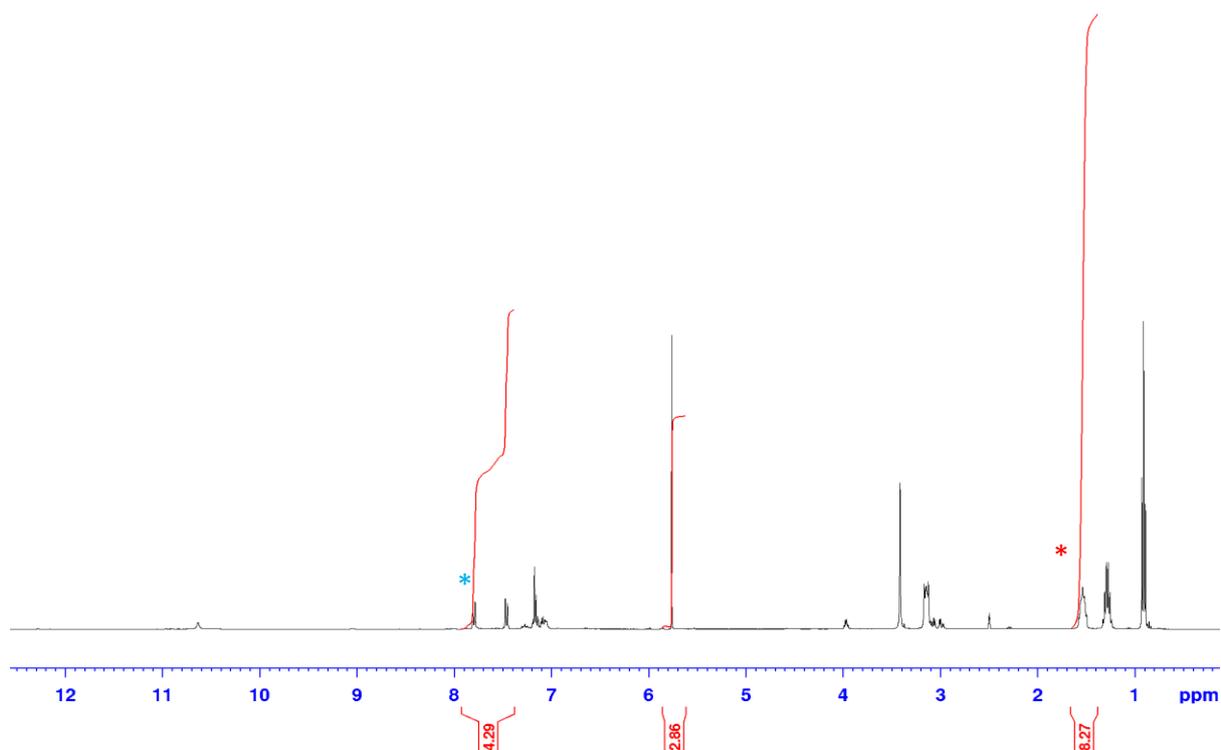

Figure S25 - ^1H NMR spectrum ($d_1 = 60$ s) of **7** (112 mM) in $\text{DMSO-}d_6/1.0\%$ DCM. Comparative integration indicates 0 % of the anionic component (blue) and 0 % of the cationic component (red) of **7** has become NMR silent.

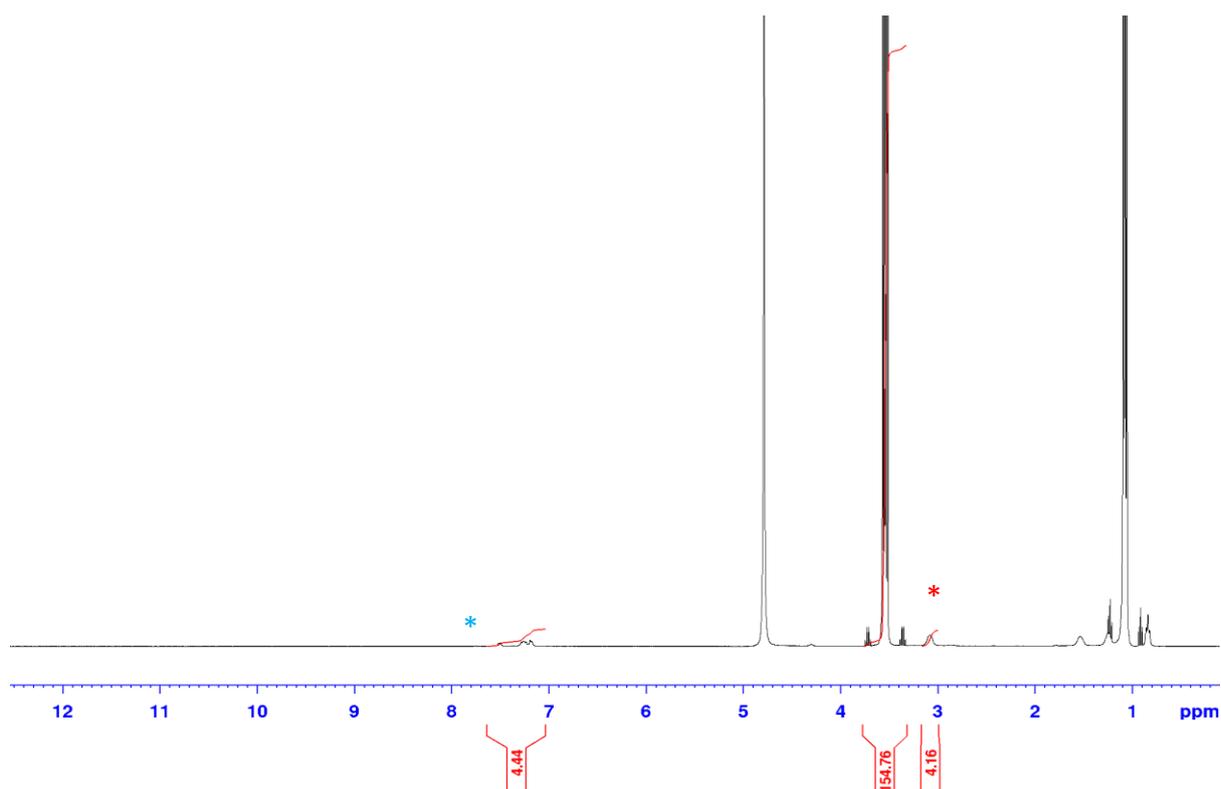

Figure S26 - ^1H NMR spectrum ($d_1 = 60$ s) of **7** (5.56 mM) in $\text{D}_2\text{O}/5.0\%$ EtOH. Comparative integration indicates 51 % of the anionic component (blue) and 48 % of the cationic component (red) of **7** has become NMR silent.

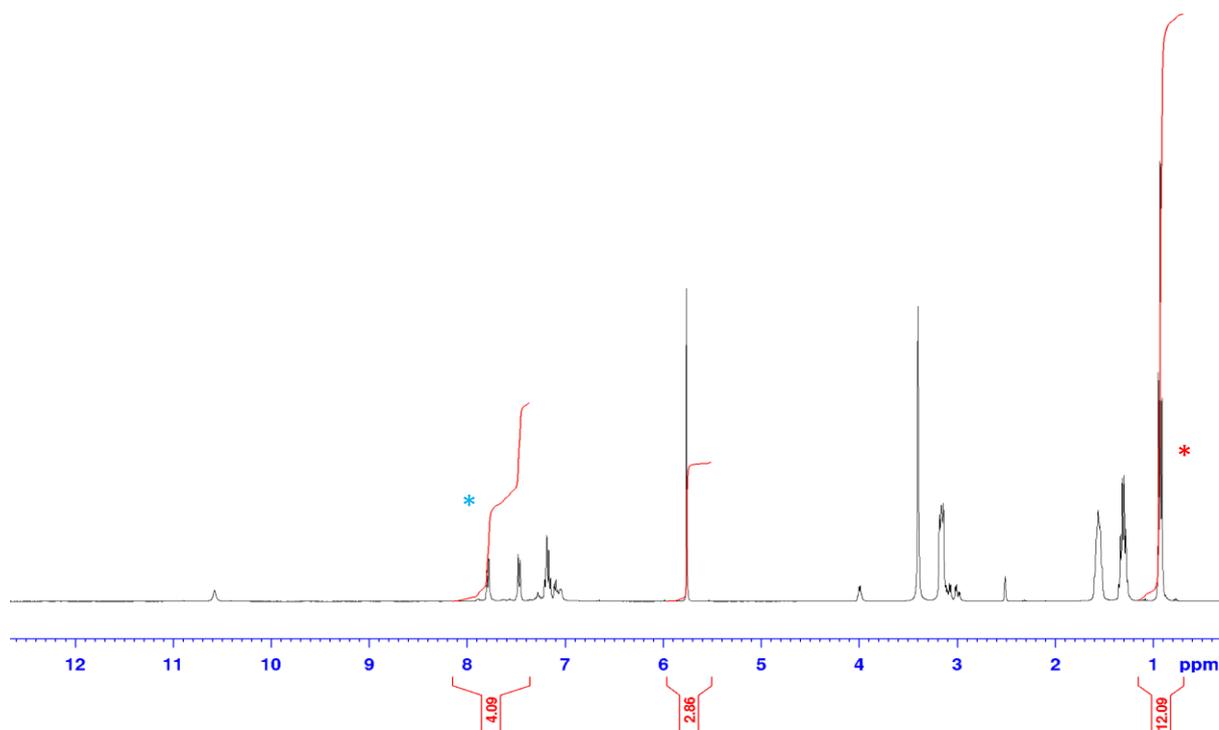

Figure S27 - ^1H NMR spectrum ($d_1 = 60$ s) of **9** (112 mM) in $\text{DMSO-}d_6/1.0\%$ DCM. Comparative integration indicates 0 % of the anionic component (blue) and 0 % of the cationic component (red) of **9** has become NMR silent.

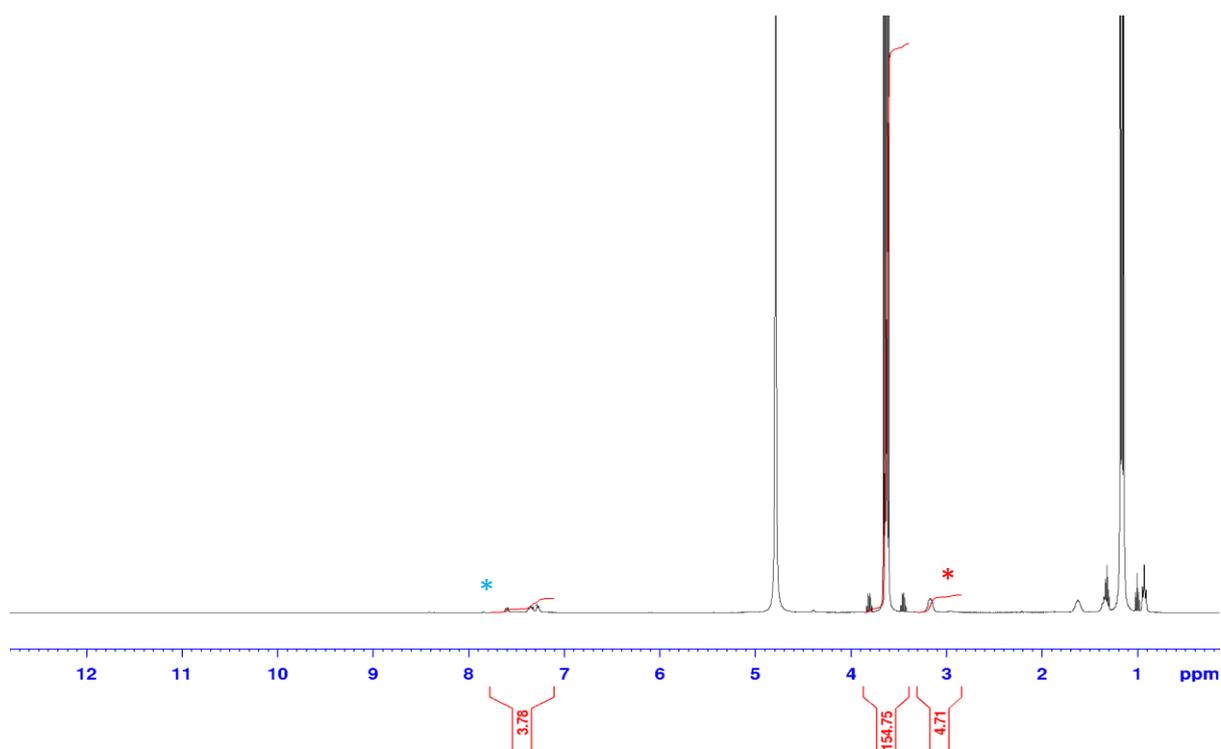

Figure S28 - ^1H NMR spectrum ($d_1 = 60$ s) of **9** (5.56 mM) in $\text{D}_2\text{O}/ 5.0\%$ EtOH. Comparative integration indicates 58 % of the anionic component (blue) and 53 % of the cationic component (red) of **9** has become NMR silent.

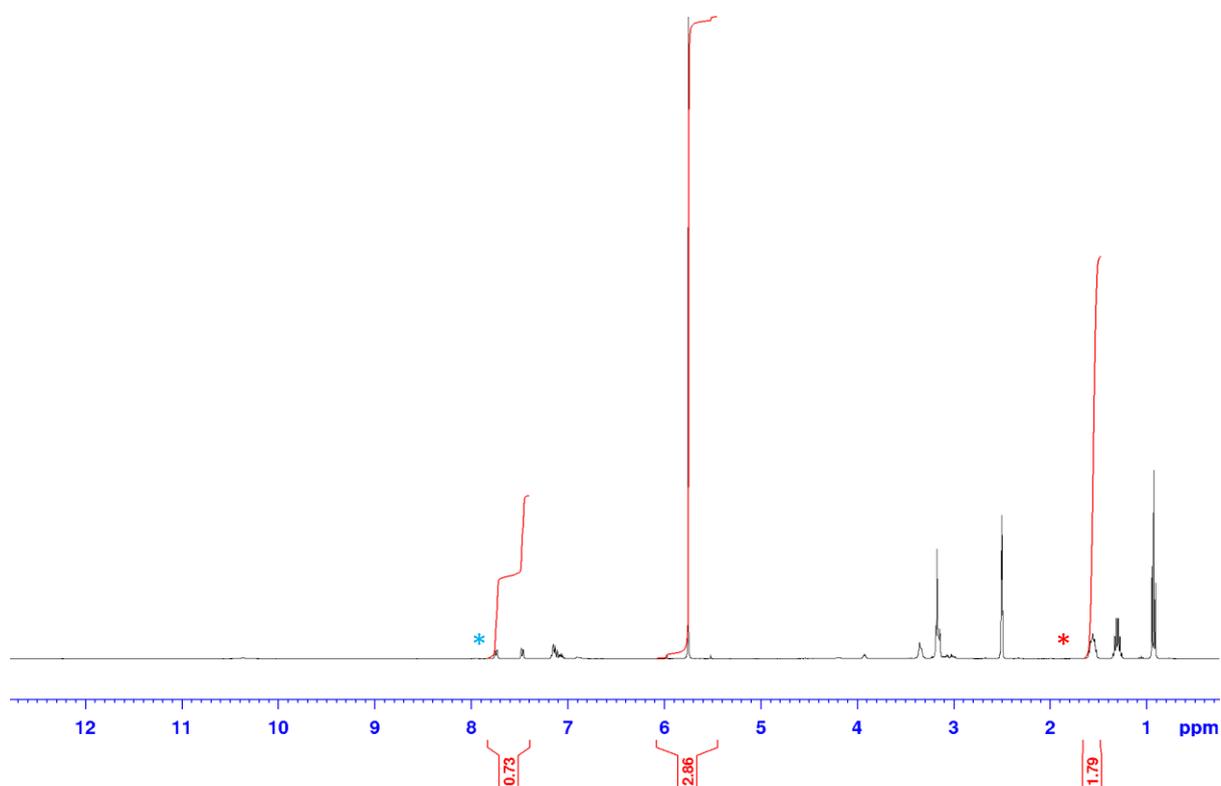

Figure S29 - ^1H NMR spectrum ($d_1 = 60$ s) of **7** and **9** (112 mM) in $\text{DMSO-}d_6/ 1.0\%$ DCM. Comparative integration indicates 82 % of the anionic component (blue) and 78 % of the cationic component (red) has become NMR silent.

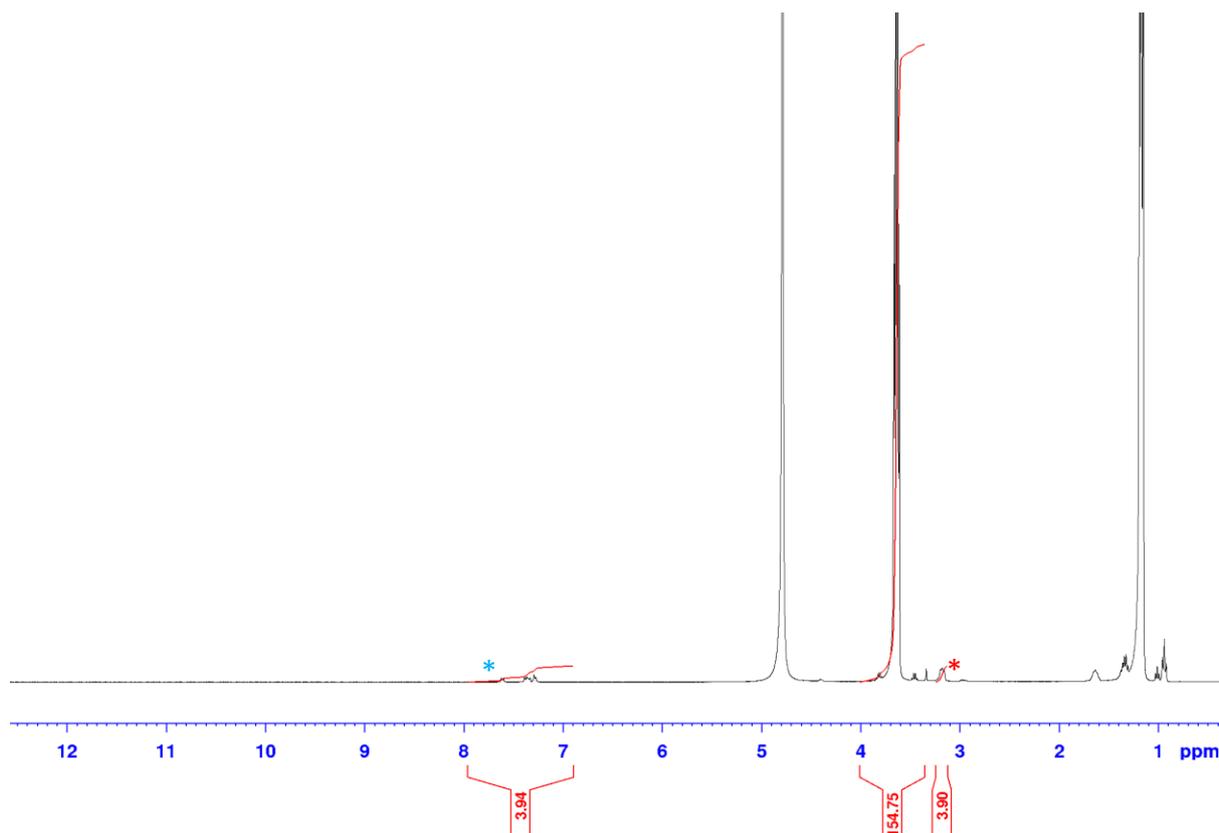

Figure S30 - ^1H NMR spectrum ($d_1 = 60$ s) of a 1:1 enantiomeric mixture of **7** + **9** (5.56 mM) in $\text{D}_2\text{O}/5.0\%$ EtOH. Comparative integration indicates 56 % of the anionic component (blue) and 51 % of the cationic component (red) has become NMR silent.

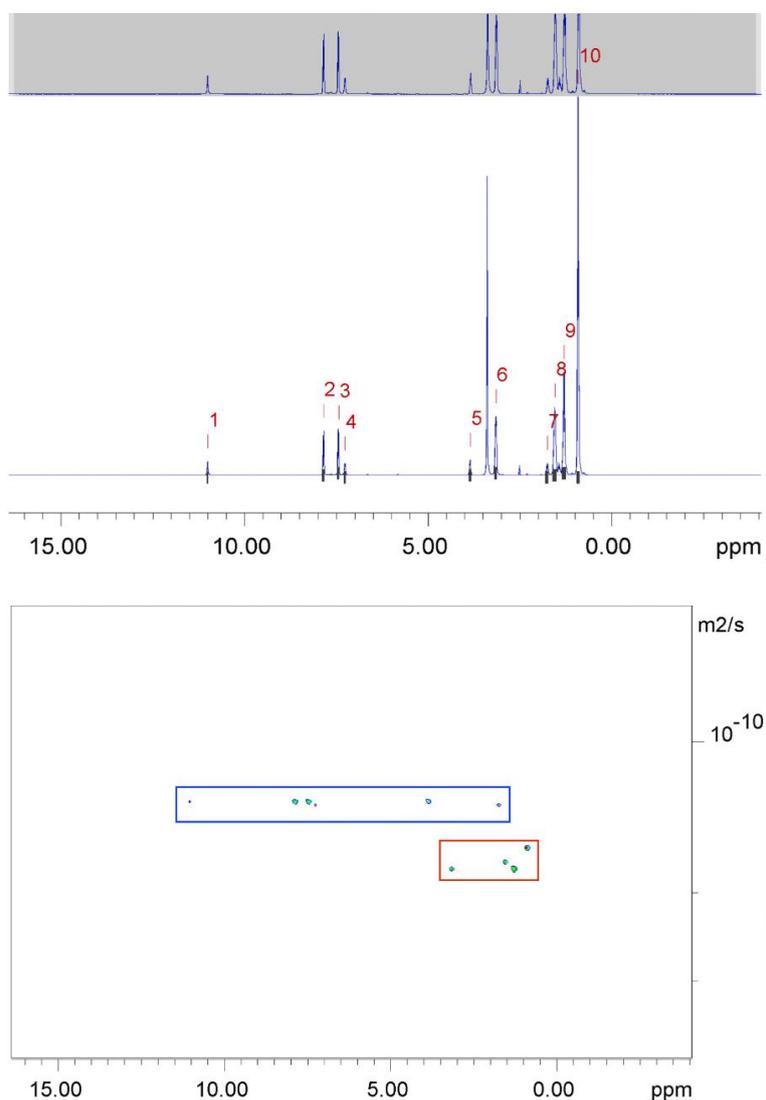

Summary

Table S5 – Overview of results of the quantitative ^1H NMR (qNMR) studies for **3**, **5**, **7**, **9** and 1:1 enantiomeric mixtures of **3** + **5** and **7** + **9** performed at concentrations of ≈ 112 mM in $\text{DMSO}-d_6/1.0\%$ DCM and 5.56 mM in $\text{D}_2\text{O}/5.0\%$ EtOH. Values given in % represent the observed proportion of compound that has become NMR silent.

Compound	$\text{DMSO}-d_6/1.0\%$ DCM (%)		$\text{D}_2\text{O}/5.0\%$ EtOH (%)	
	Anionic component	Cationic component	Anionic component	Cationic component
3	0	0	50	44
5	0	0	52	48
3 + 5 ^a	68	69	31	33
7	0	0	51	48
9	0	0	58	53
7 + 9 ^a	82	78	56	51

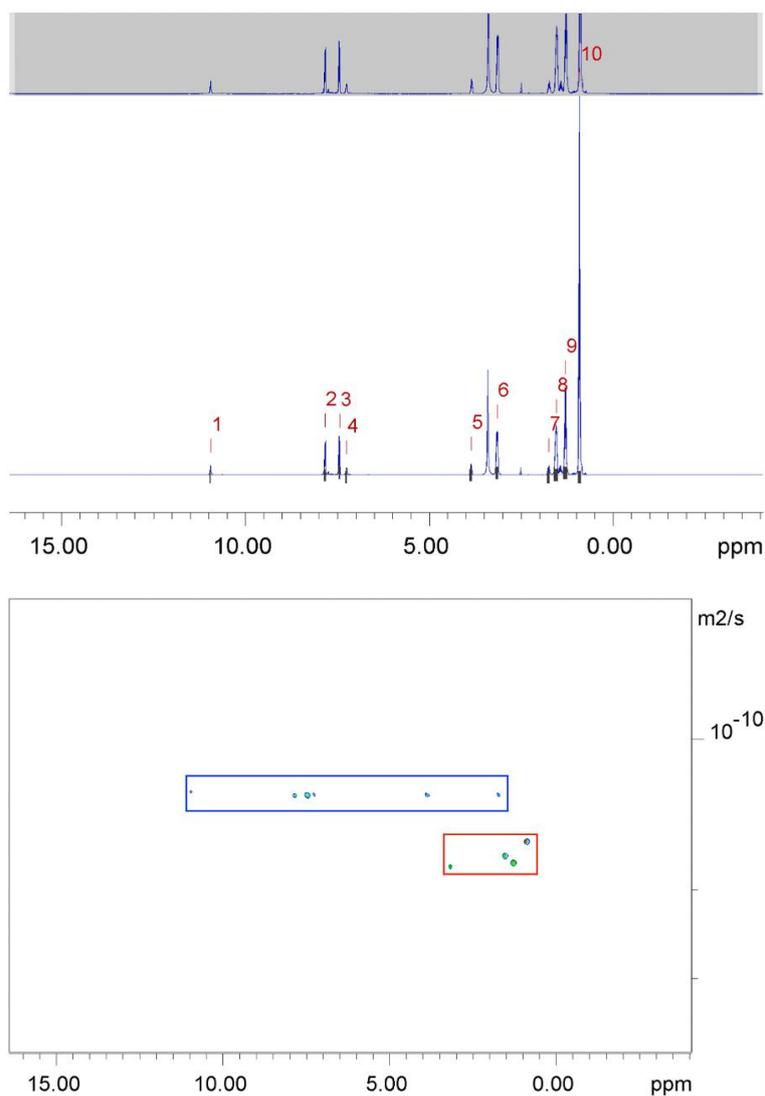

^a – 1:1 mixture.

Figure S36 – ^1H DOSY NMR of a 1:1 enantiomeric mixture of **7** + **9** (112 mM) in a $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ solution conducted at 298 K and a table reporting the diffusion constants calculated for each peak used to determine the hydrodynamic diameter (d_H) of the anionic component. The anionic component is highlighted in blue and corresponds to peaks 1-6 and 8 ($d_H = 0.88$ nm), while the cationic component is highlighted in red and corresponds to peaks 7 and 9-11 ($d_H = 0.92$ nm).

Summary

Table S6 - Overview of diffusion coefficients (m^2s^{-1}) of **3**, **5**, **7**, **9**, and 1:1 enantiomeric mixtures of **3 + 5** and **7 + 9** in a DMSO- d_6 /0.5 % H₂O solution at 298 K. Errors for diffusion constants are no greater than $\pm 1 \times 10^{-13} \text{m}^2\text{s}^{-1}$.

Compound	Diffusion coefficient (m^2s^{-1})	
	Anionic component	Cationic component
3	1.32×10^{-10}	1.74×10^{-10}
5	1.29×10^{-10}	1.72×10^{-10}
3 + 5^a	1.61×10^{-10}	2.12×10^{-10}
7	1.29×10^{-10}	1.72×10^{-10}
9	1.32×10^{-10}	1.76×10^{-10}
7 + 9^a	2.48×10^{-10}	2.40×10^{-10}

a – 1:1 mixture.

Table S7 - Overview of hydrodynamic diameters (nm) for **3**, **5**, **7**, **9**, and 1:1 enantiomeric mixture of **3 + 5** and **7 + 9** in a DMSO- d_6 /0.5 % H₂O solution at 298 K.

Compound	Hydrodynamic diameter (nm)	
	Anionic component	Cationic component
1	1.26-1.29 ⁵	<i>b</i>
3	1.66	1.26
5	1.70	1.28
3 + 5^a	1.36	1.04
7	1.70	1.27
9	1.67	1.24
7 + 9^a	0.88	0.92

a – 1:1 mixture.

b – Data not available.

Section S9: ^1H NMR self-association data

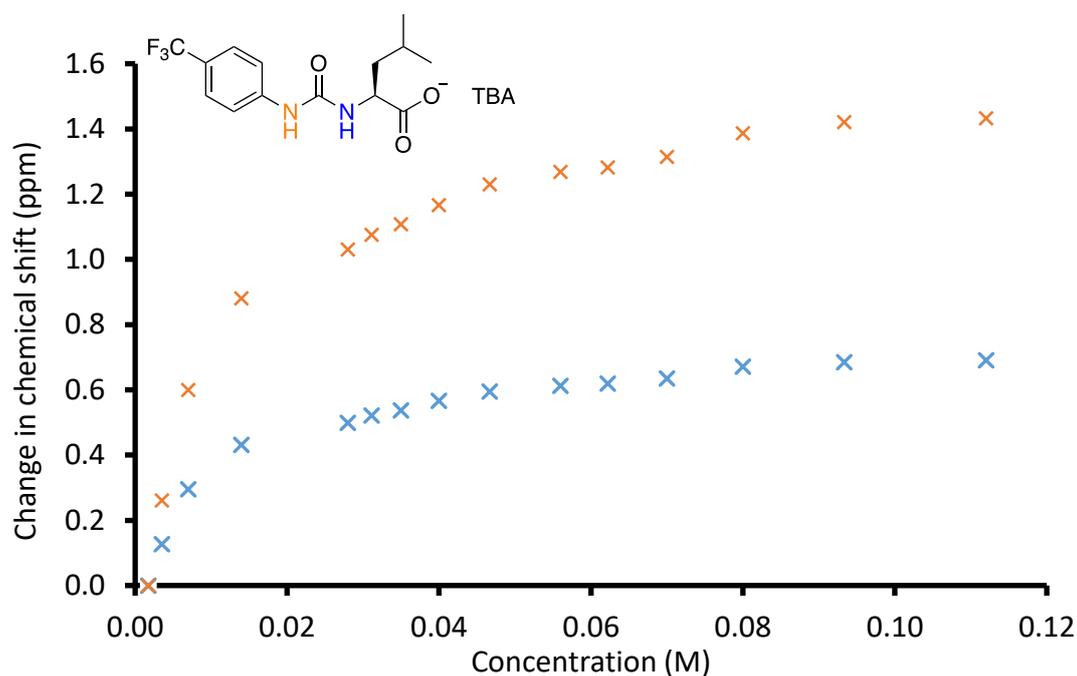

Figure S37 – Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances with increasing concentration of **3** in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Self-association constant calculation: values were calculated from data gathered from both NH's and fitted to the Cooperative Equal K (CoEK) and Equal K/ dimerization binding models.

Equal K/Dimerization model (Nelder-Mead fit):

$$K_e = 242.72 \text{ M}^{-1} \pm 3.80 \% \quad K_{\text{dim}} = 121.36 \text{ M}^{-1} \pm 1.90 \%$$

<http://app.supramolecular.org/bindfit/view/51ce652b-7b2b-4974-8812-79d1ae73fc4f>

CoEK model (Nelder-Mead fit):

$$K_e = 560.90 \text{ M}^{-1} \pm 5.21 \% \quad K_{\text{dim}} = 280.45 \text{ M}^{-1} \pm 2.61 \% \quad \rho = 2.29 \pm 9.25 \%$$

<http://app.supramolecular.org/bindfit/view/c48548c8-ee64-4855-8686-7c76c927c103>

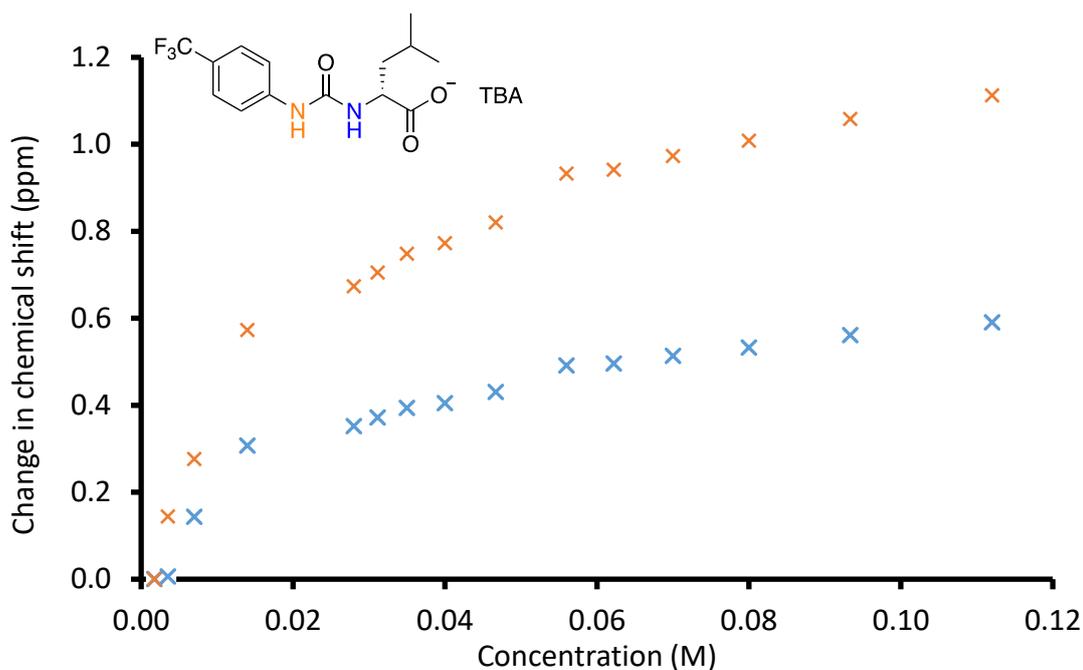

Figure S38 – Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances with increasing concentration of **5** in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Self-association constant calculation: values were calculated from data gathered from both NH's and fitted to the Cooperative Equal K (CoEK) and Equal K/ dimerization binding models.

Equal K/Dimerization model:

$$K_e = 180.55 \text{ M}^{-1} \pm 6.48\% \quad K_{\text{dim}} = 90.27 \text{ M}^{-1} \pm 3.24\%$$

<http://app.supramolecular.org/bindfit/view/b8b3ad35-c95a-4b43-ab01-9424006b8cf2>

CoEK model:

$$K_e = 351.80 \text{ M}^{-1} \pm 7.18\% \quad K_{\text{dim}} = 175.90 \text{ M}^{-1} \pm 3.59\% \quad \rho = 3.41 \pm 12.69\%$$

<http://app.supramolecular.org/bindfit/view/3c8e5c40-cd1e-4e18-9c93-530cc3f7c71c>

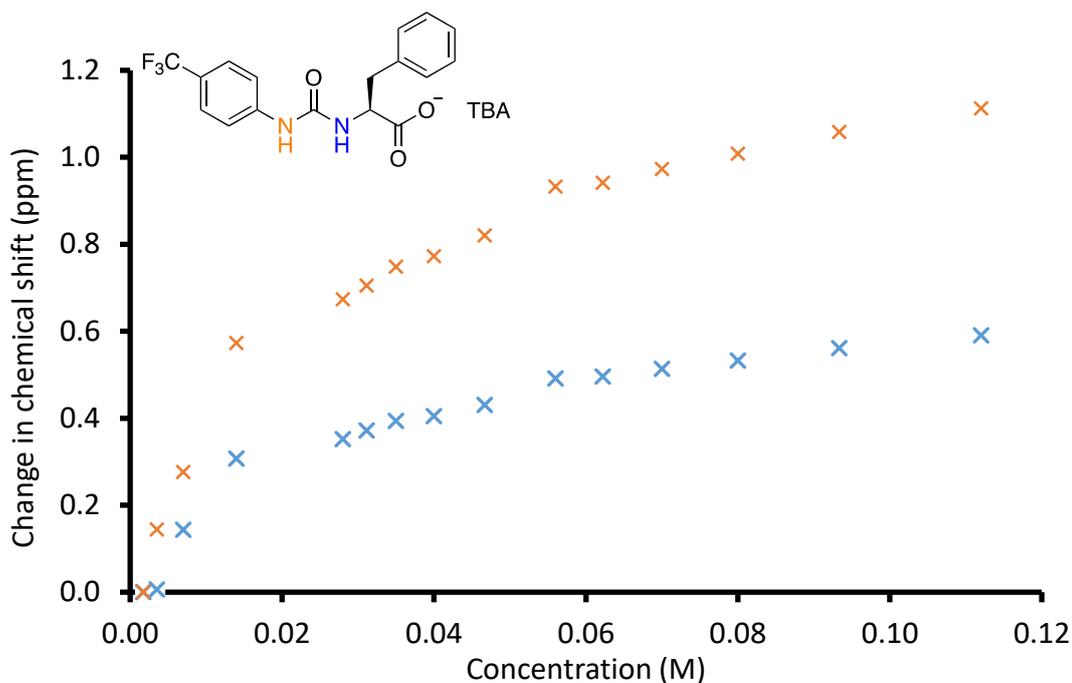

Figure S39 – Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances with increasing concentration of **7** in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Self-association constant calculation: values were calculated from data gathered from both NH's and fitted to the Cooperative Equal K (CoEK) and Equal K/ dimerization binding models.

Equal K/Dimerization model:

$$K_e = 55.52 \text{ M}^{-1} \pm 4.24\% \quad K_{\text{dim}} = 27.76 \text{ M}^{-1} \pm 2.12\%$$

<http://app.supramolecular.org/bindfit/view/3bb6b512-7ffd-4fb2-b22c-3423a512b003>

CoEK model:

$$K_e = 21.17 \text{ M}^{-1} \pm 6.11\% \quad K_{\text{dim}} = 10.58 \text{ M}^{-1} \pm 3.06\% \quad \rho = 2.86 \pm 14.59\%$$

<http://app.supramolecular.org/bindfit/view/0d92b6d7-4c95-488c-bc2d-3fe43e1e4cb7>

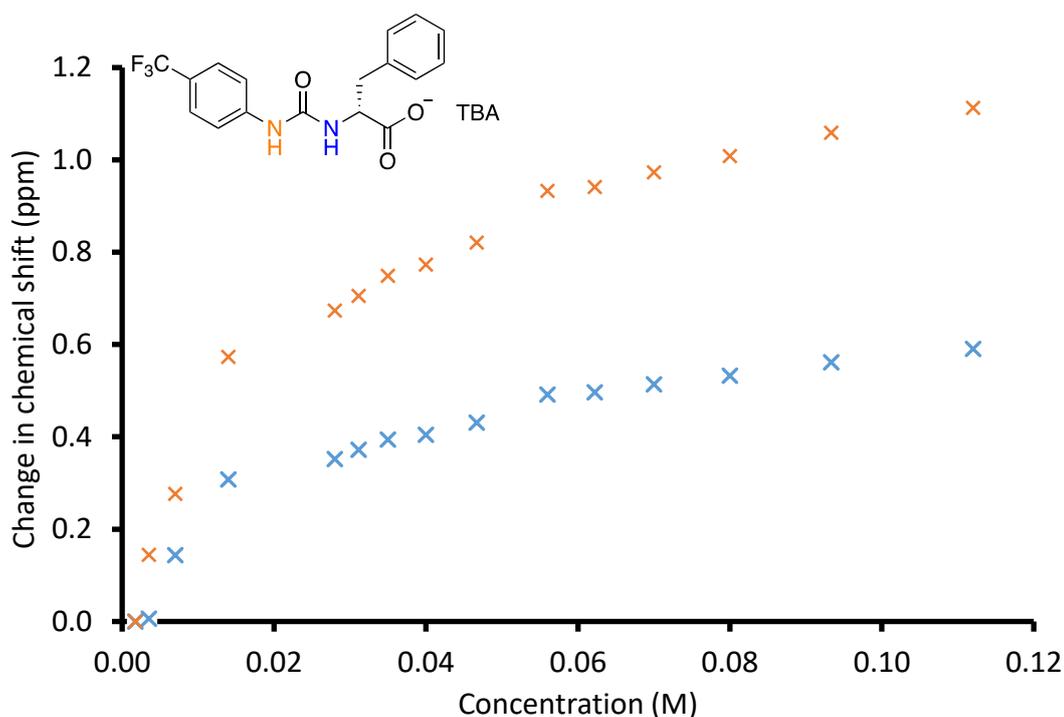

Figure S40 – Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances with increasing concentration of **9** in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Self-association constant calculation: values were calculated from data gathered from both NH's and fitted to the Cooperative Equal K (CoEK) and Equal K/ dimerization binding models.

Equal K/Dimerization model:

$$K_e = 45.90 \text{ M}^{-1} \pm 5.03\% \quad K_{\text{dim}} = 22.95 \text{ M}^{-1} \pm 2.52\%$$

<http://app.supramolecular.org/bindfit/view/3abcecc0-ffc9-4e4e-917f-14958fbcf026>

CoEK model:

$$K_e = 17.84 \text{ M}^{-1} \pm 8.52\% \quad K_{\text{dim}} = 8.92 \text{ M}^{-1} \pm 4.26\% \quad \rho = 2.62 \pm 19.62\%$$

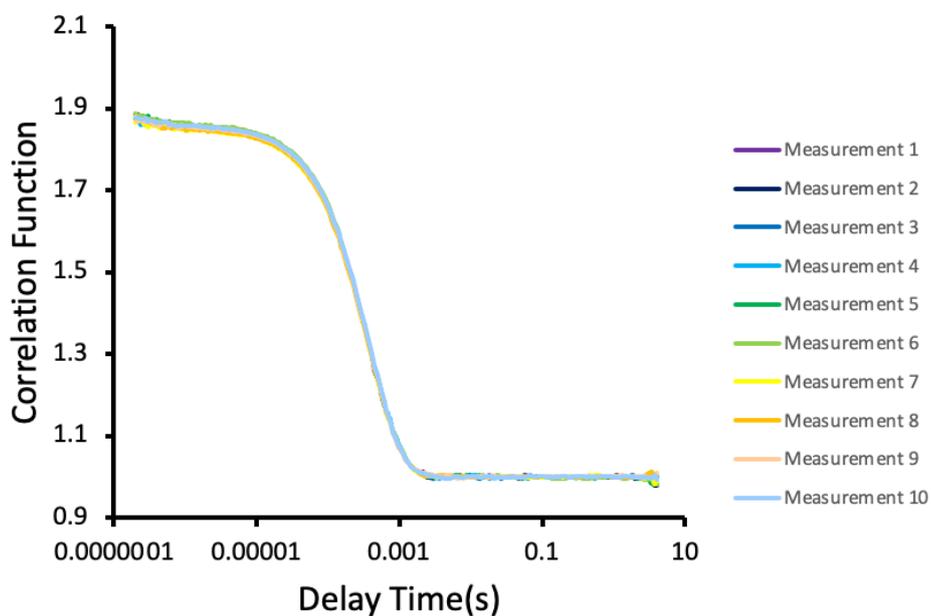

Figure S76 – The correlation function data for 10 DLS runs of a 1:1 enantiomeric mixture of **7** + **9** (5.56 mM) in H₂O/5 % EtOH at 298 K (3rd repeat).

Summary

Table S9 - The peak maxima and polydispersity indices obtained for **1**, **3**, **5**, **7**, **9**, and 1:1 enantiomeric mixtures of **3 + 5** and **7 + 9** obtained at 5.56 mM in H₂O/5 % EtOH. An annealing process was applied in which the samples were heated to approximately 313 K before being cooled down to a measurement temperature of 298 K. The errors given are the standard error of the average.

	Average	-65.31 (± 0.31)

^a – 1:1 mixture.

Error = standard error of the mean.

Section S12: Surface tension measurements and critical aggregate concentration (CAC) determination

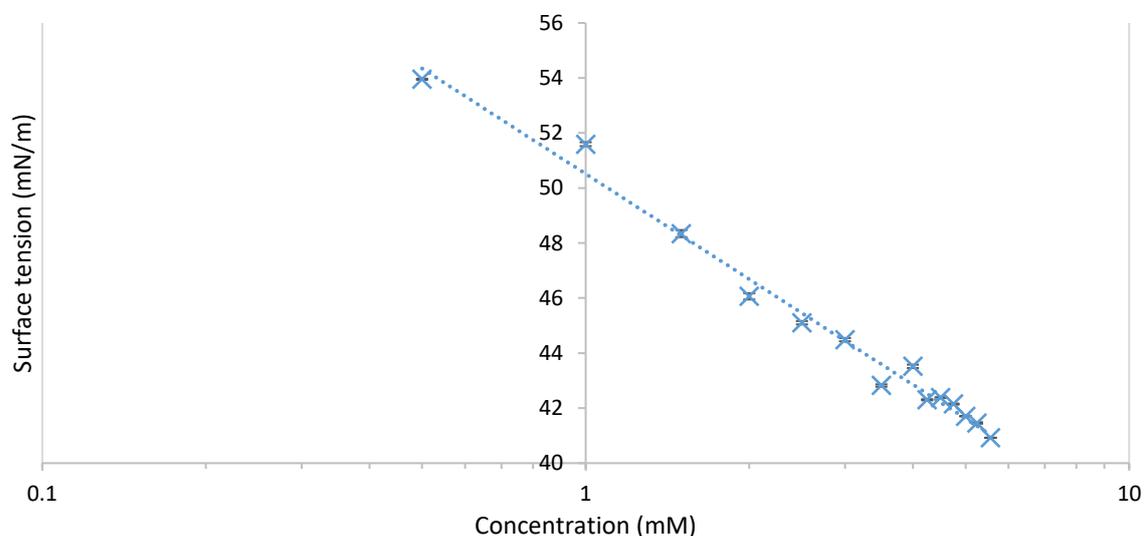

Figure S95 – Determination of the critical aggregate concentration of **3** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 40.92 mN/m.

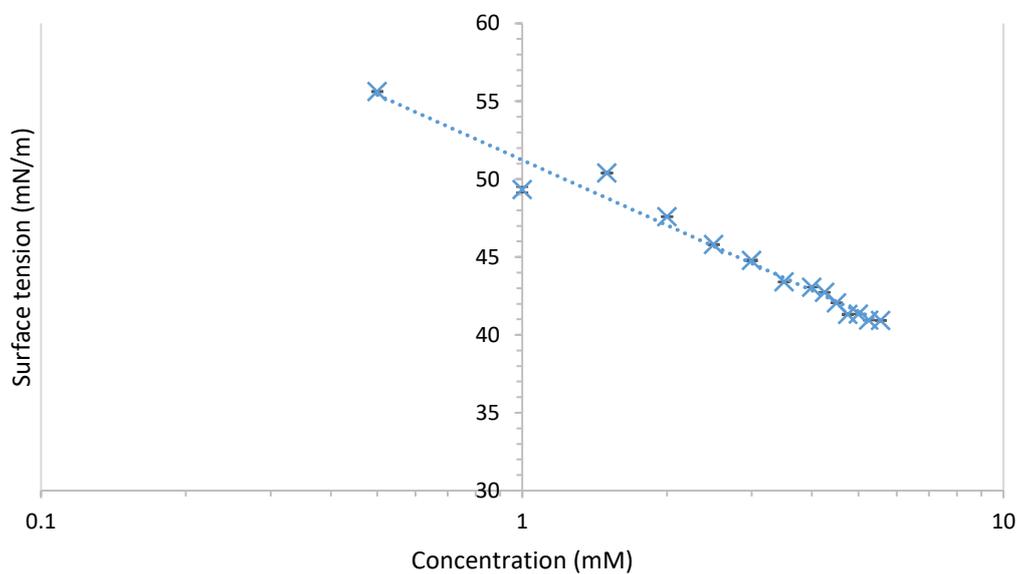

Figure S96 - Determination of the critical aggregate concentration of **5** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 40.92 mN/m.

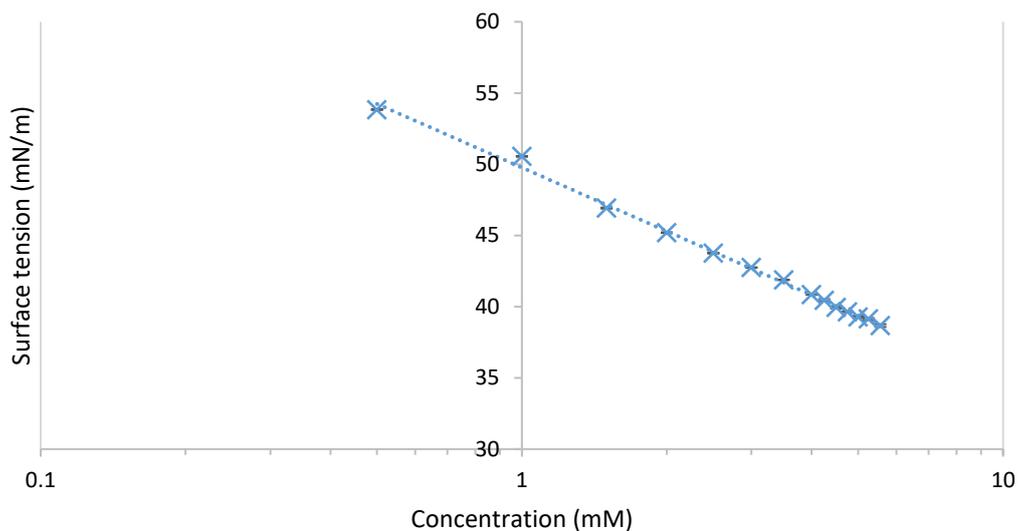

Figure S97 - Determination of the critical aggregate concentration of **3 + 5** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 38.67 mN/m.

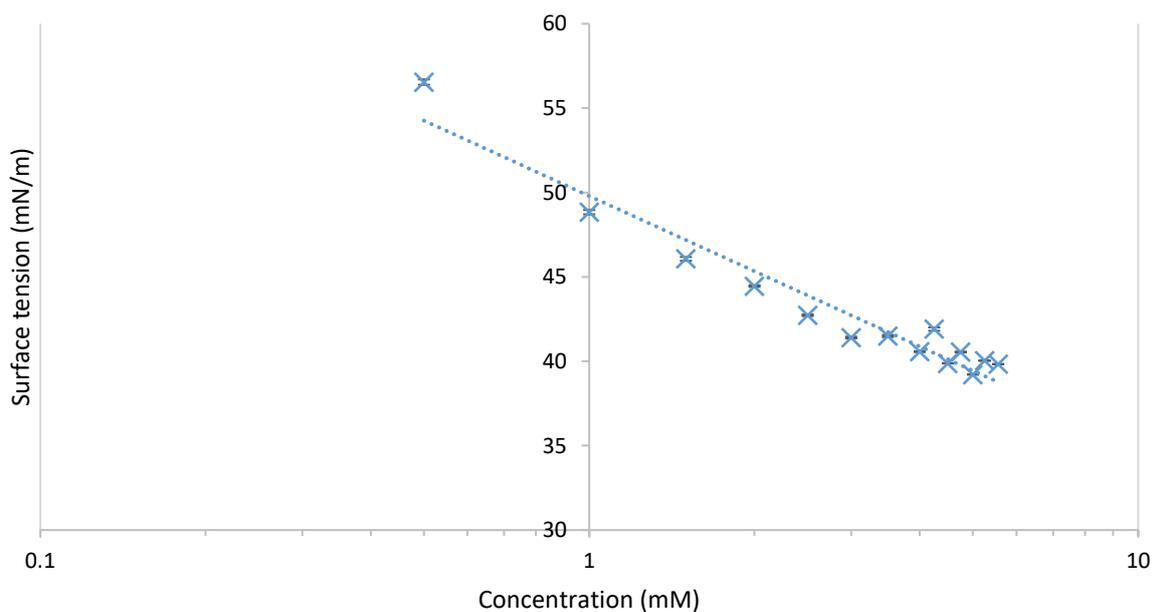

Figure S98 - Determination of the critical aggregate concentration of **7** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 39.83 mN/m.

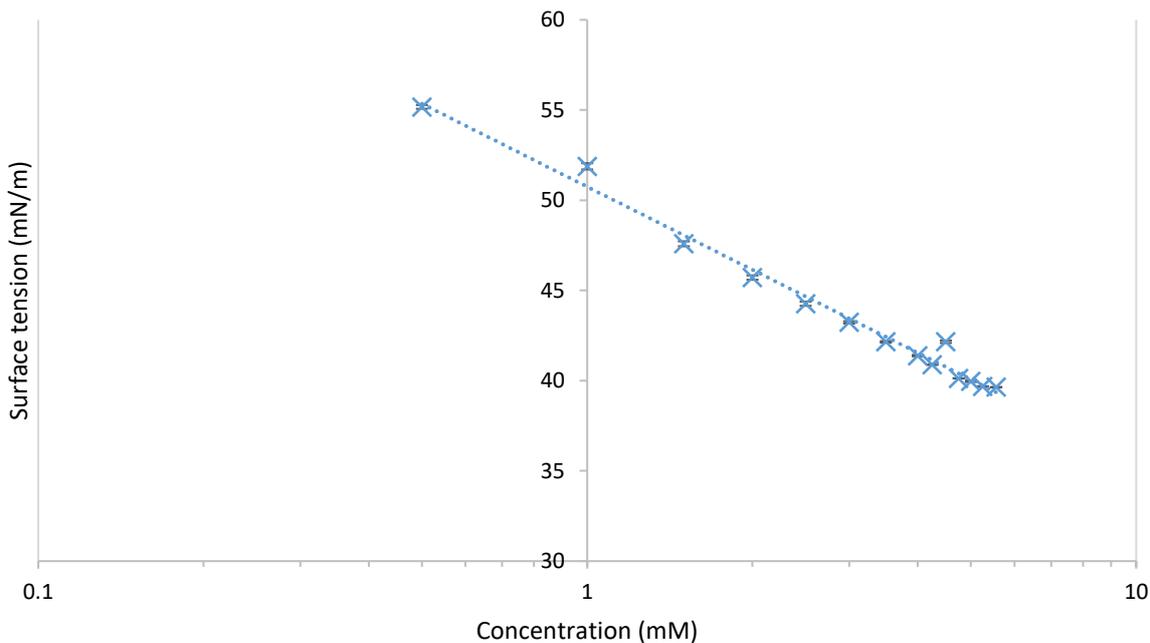

Figure S99 - Determination of the critical aggregate concentration of **9** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 39.64 mN/m.

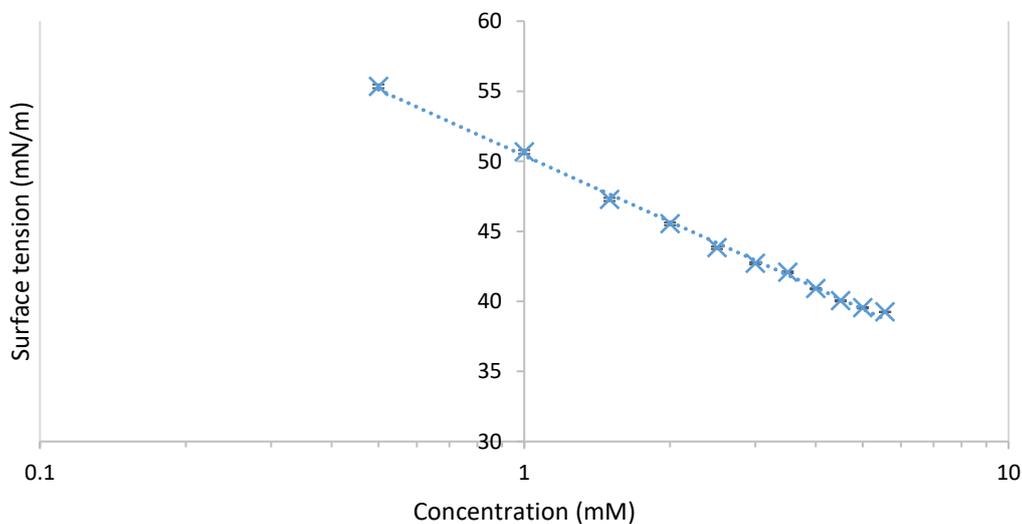

Figure S100 - Determination of the critical aggregate concentration of **7 + 9** in H₂O/5 % EtOH using surface tension measurements. The CAC is above the limit of solubility (5.56 mM), at which the surface tension is 39.25 mN/m.

Section S13: Single crystal X-ray structures

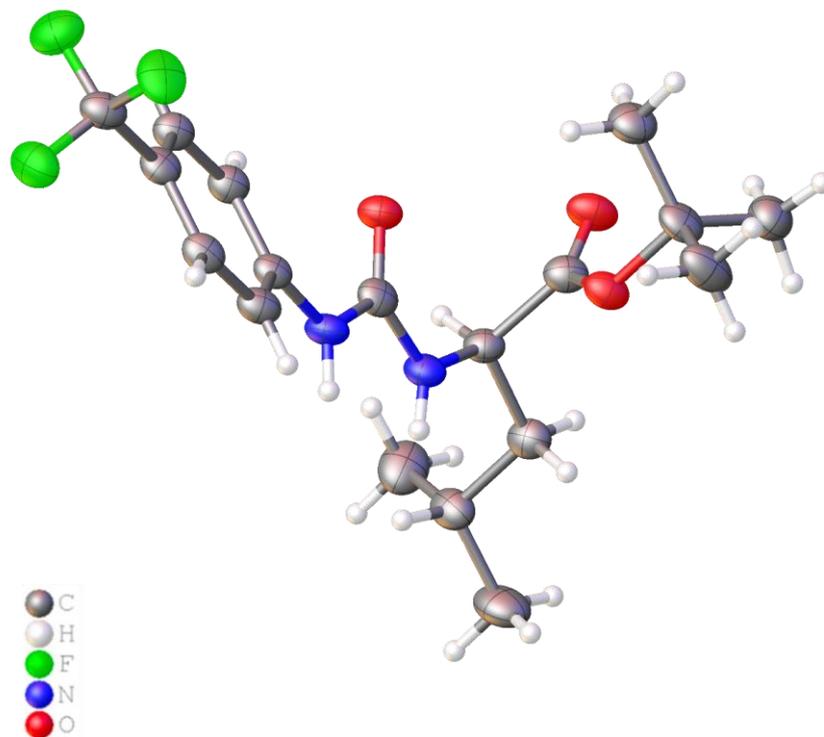

Figure S101 – Single crystal X-ray structure of **2**: red = oxygen; green = fluorine; blue = nitrogen; white = hydrogen; grey = carbon. CCDC 2205767, $C_{18}H_{25}F_3N_2O_3$ ($M = 374.40$): orthorhombic, space group $P 21 21 21$, $a = 5.5098(7) \text{ \AA}$, $b = 18.427(4) \text{ \AA}$, $c = 18.838(3) \text{ \AA}$, $\alpha = 90^\circ$, $\beta = 90^\circ$, $\gamma = 90^\circ$, $V = 1912.6(6) \text{ \AA}^3$, $Z = 4$, $T = 100(1) \text{ K}$, $\text{CuK}\alpha = 1.5418 \text{ \AA}$, $D_{\text{calc}} = 1.300 \text{ g/cm}^3$, 12906 reflections measured ($9.390 \leq 2\theta \leq 148.174$), 3720 unique ($R_{\text{int}} = 0.1367$, $R_{\text{sigma}} = 0.1210$) which were used in all calculations. The final R_1 was 0.0591 ($I > 2\sigma(I)$) and wR_2 was 0.1361 (all data).

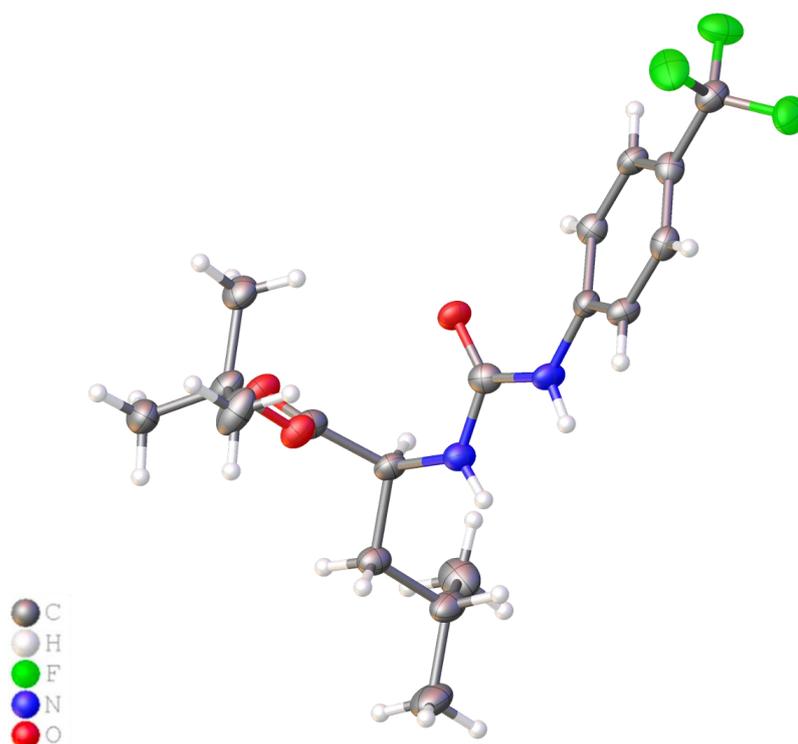

Figure S102 – Single crystal X-ray structure of **4**: red = oxygen; green = fluorine; blue = nitrogen; white = hydrogen; grey = carbon. CCDC 2205768, $C_{18}H_{25}F_3N_2O_3$ ($M = 374.40$): orthorhombic, space group P 21 21 21, $a = 5.5068(4)$ Å, $b = 18.3998(17)$ Å, $c = 18.8406(14)$ Å, $\alpha = 90^\circ$, $\beta = 90^\circ$, $\gamma = 90^\circ$, $V = 1909(3)$ Å³, $Z = 4$, $T = 100(1)$ K, $\text{CuK}\alpha = 1.5418$ Å, $D_{\text{calc}} = 1.303$ g/cm³, 12686 reflections measured ($9.388 \leq 2\theta \leq 143.696$), 3691 unique ($R_{\text{int}} = 0.0935$, $R_{\text{sigma}} = 0.0908$) which were used in all calculations. The final R_1 was 0.0663 ($I > 2\sigma(I)$) and wR_2 was 0.1531 (all data).

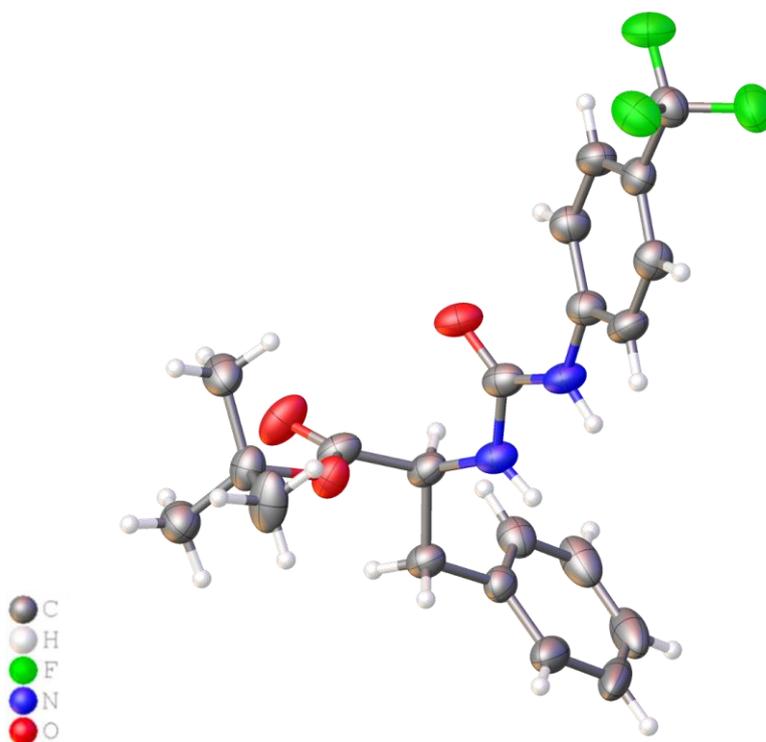

Figure S103 - Single crystal X-ray structure of **6**: red = oxygen; green = fluorine; blue = nitrogen; white = hydrogen; grey = carbon. CCDC 2205765, $C_{21}H_{23}F_3N_2O_3$ ($M = 408.41$): orthorhombic, space group P 21 21 21, $a = 5.7353(4)$ Å, $b = 18.3597(18)$ Å, $c = 19.4042(15)$ Å, $\alpha = 90^\circ$, $\beta = 90^\circ$, $\gamma = 90^\circ$, $V = 2043.2(3)$ Å³, $Z = 4$, $T = 100(1)$ K, $CuK\alpha = 1.5418$ Å, $D_{calc} = 1.328$ g/cm³, 13037 reflections measured ($9.114 \leq 2\theta \leq 144.834$), 3930 unique ($R_{int} = 0.0790$, $R_{sigma} = 0.0731$) which were used in all calculations. The final R_1 was 0.0717 ($I > 2\sigma(I)$) and wR_2 was 0.1927 (all data).

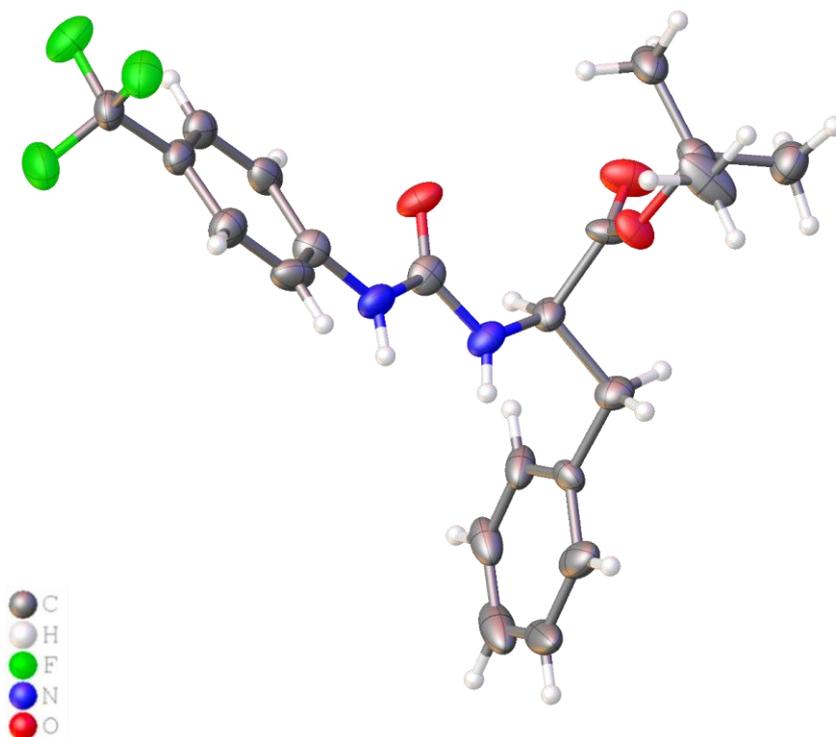

Figure S104 – Single crystal X-ray structure of **8**: red = oxygen; green = fluorine; blue = nitrogen; white = hydrogen; grey = carbon. CCDC 2205766, $C_{21}H_{23}F_3N_2O_3$ ($M = 408.41$): orthorhombic, space group P 21 21 21, $a = 5.7453(6)$ Å, $b = 18.227(3)$ Å, $c = 19.3974(16)$ Å, $\alpha = 90^\circ$, $\beta = 90^\circ$, $\gamma = 90^\circ$, $V = 2036.8(4)$ Å³, $Z = 4$, $T = 100(1)$ K, $\text{CuK}\alpha = 1.5418$ Å, $D_{\text{calc}} = 1.332$ g/cm³, 4808 reflections measured ($9.118 \leq 2\theta \leq 144.298$), 3301 unique ($R_{\text{int}} = 0.1545$, $R_{\text{sigma}} = 0.1629$) which were used in all calculations. The final R_1 was 0.1056 ($I > 2\sigma(I)$) and wR_2 was 0.3038 (all data).

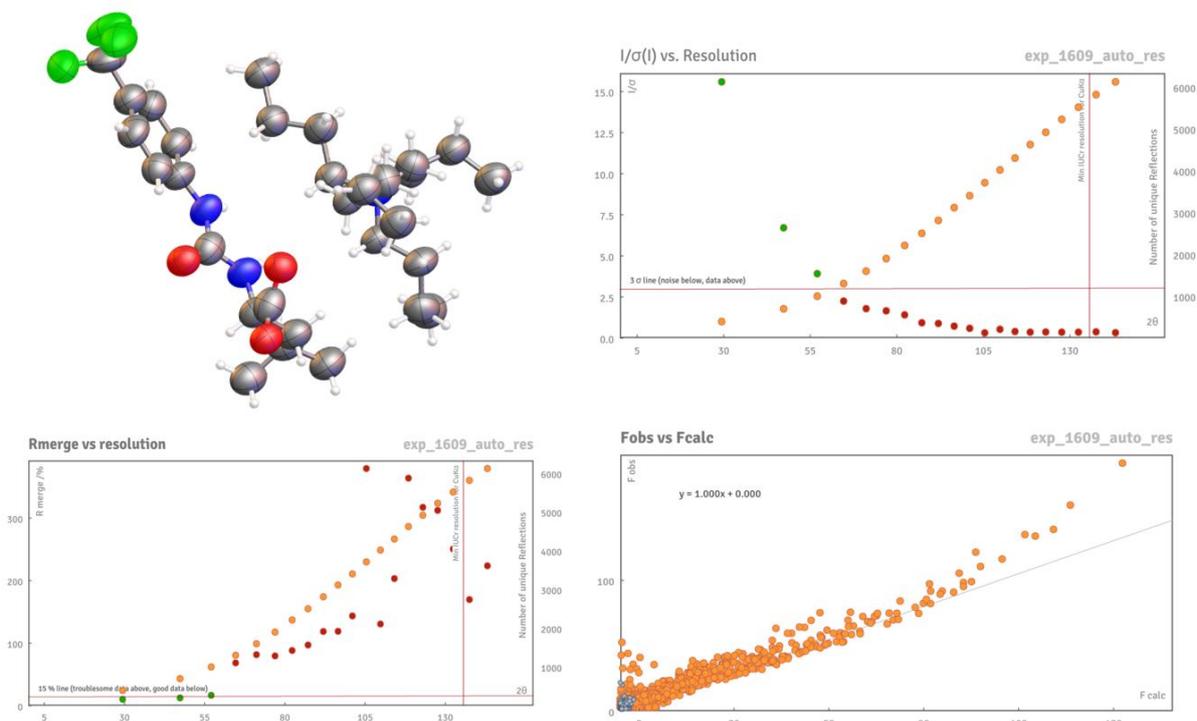

Figure S105 – Single crystal X-ray structure of **3** and **5**, obtained from a 1:1 enantiomeric mixture through slow evaporation from methanol: red = oxygen; blue = nitrogen; white = hydrogen; grey = carbon. CCDC 2218842, $C_{30}H_{52}F_3N_3O_3$ ($M = 559.74$): monoclinic, space group $P 21/c$, $a = 15.470$ (4) Å, $b = 18.843$ (6) Å, $c = 10.856$ (3) Å, $\alpha = 90^\circ$, $\beta = 90.99(3)^\circ$, $\gamma = 90^\circ$, $V = 1164.2(15)$ Å³, $Z = 4$, $T = 100(1)$ K, $CuK\alpha = 1.5418$ Å, $D_{calc} = 1.175$ g/cm³, 21210 reflections measured ($7.394 \leq 2\theta \leq 133.196$), 5590 unique ($R_{int} = 0.2749$, $R_{sigma} = 0.1847$) which were used in all calculations. The final R_1 was 0.1757 ($I > 2\sigma(I)$) and wR_2 was 0.4984 (all data). We acknowledge the poor quality of these data. Repeated attempts to obtain a crystalline sample of this material were obtained over a 1.5-year period. This was the only sample for which sufficient data could be obtained to generate a structure and was obtained from the fracturing of a single plate. The sample did not survive further analysis attempts. These data should only be used to enable the determination of atom connectivity and to approximate atomic location.

Hydrogen bonding summary

Table S11 - Hydrogen bond distances and angles observed for **2**, **4**, **6**, **8**, and **3 + 5** in a 1:1 enantiomeric mixture calculated from the single crystal X-ray structure shown in Figure S101 – Figure S105.

Compound	Hydrogen bond donor	Hydrogen atom	Hydrogen bond acceptor	Hydrogen bond length (D...A) (Å)	Hydrogen bond angle (D-H...A) (°)
2	N1	H1	O1	3.271(6)	155.4(3)

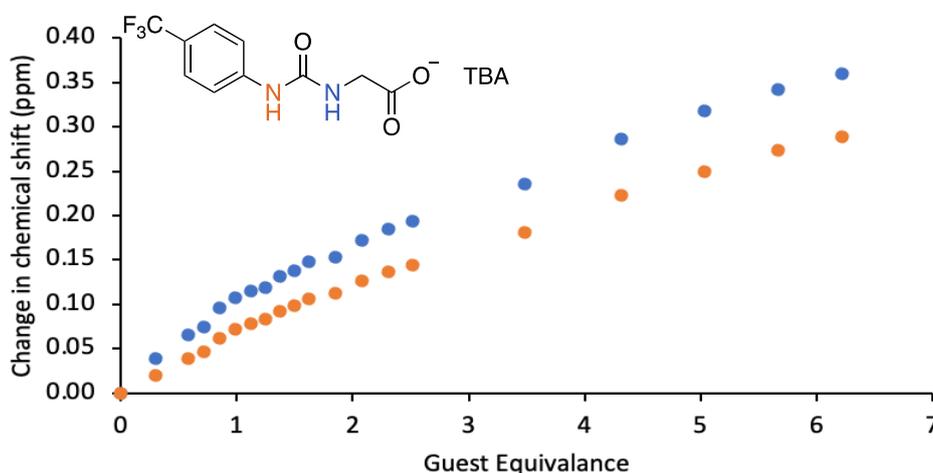

Figure S121 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **1** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **1** and fit to a 1:1 binding isotherm (Nelder-Mead fit).

$$K_a = 12.59 \text{ M}^{-1} \pm 1.77\%$$

<http://app.supramolecular.org/bindfit/view/812372fc-44c7-4572-a273-30c4cd88eb35>

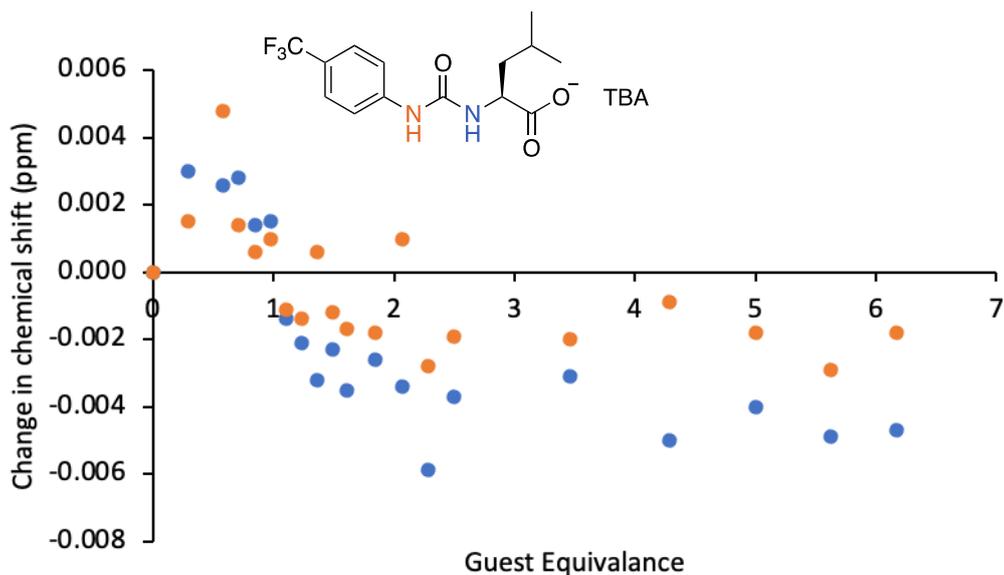

Figure S122 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **3** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **3**. The data could not be fitted as it is below the limit of detection of the NMR machine.

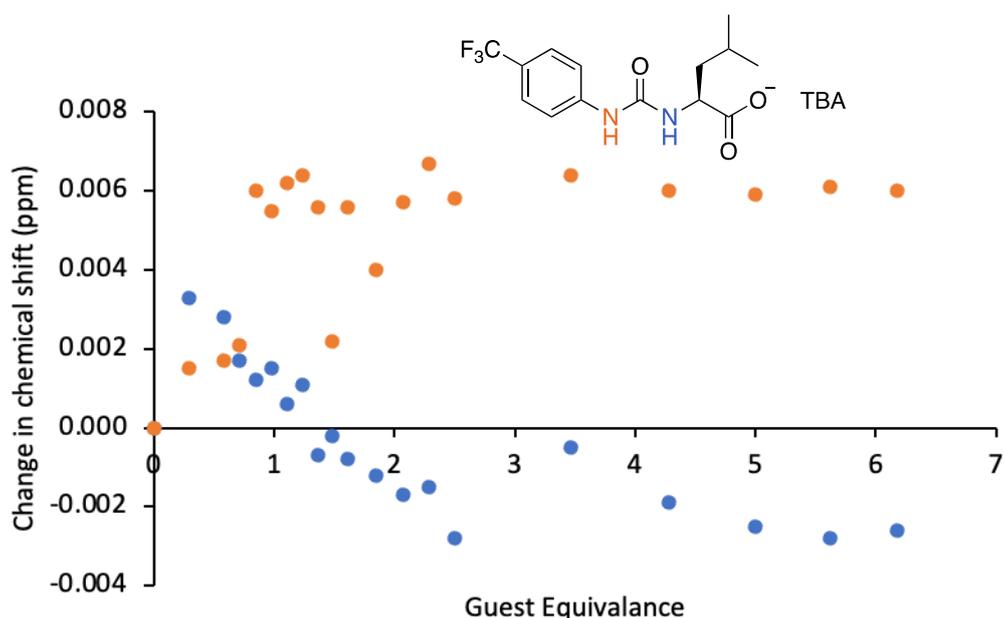

Figure S123 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **3** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **3**. The data could not be fitted as the change in chemical shift is less than 0.01 ppm.

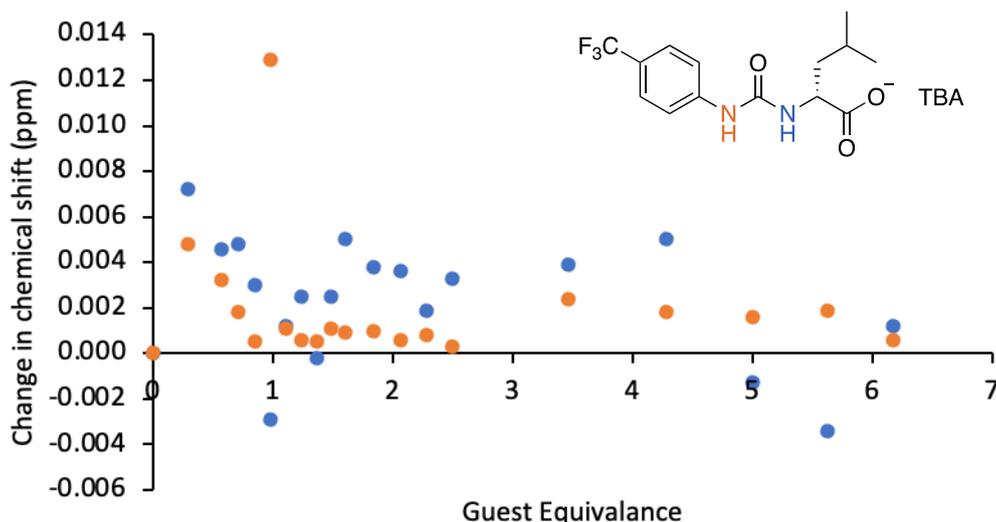

Figure S124 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **5** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **5**. The data could not be fitted as the overall change in chemical shift is less than 0.01 ppm.

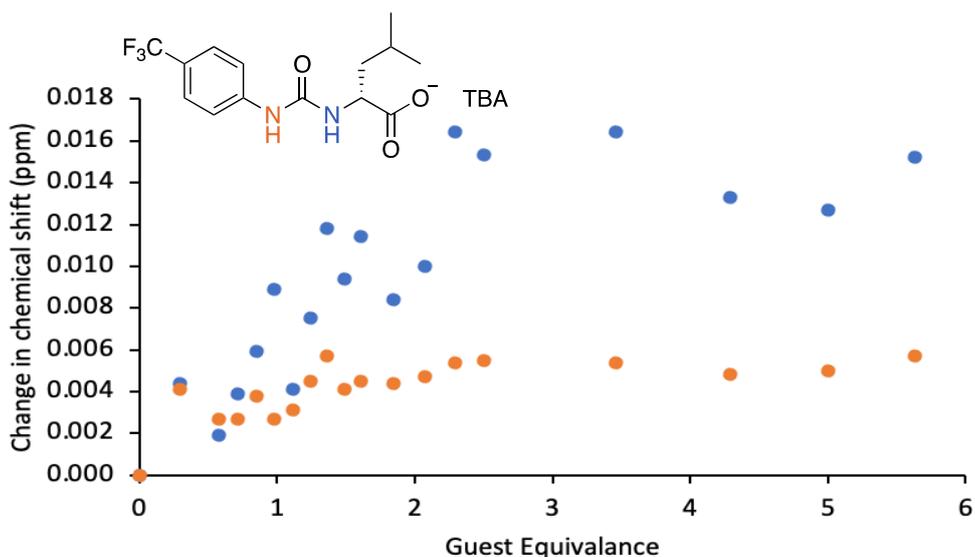

Figure S125 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **5** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from only one urea NH resonance in **5**, as the other NH resonance had change in chemical shift is less than 0.01 ppm. The data was fit to a 1:1 binding isotherm (Nelder-Mead fit) but no association constant is reported for the formation of any complex due to the 40 % error calculated for the fit of these data.

<http://app.supramolecular.org/bindfit/view/48194597-20be-4f60-9019-b49603589fcb>

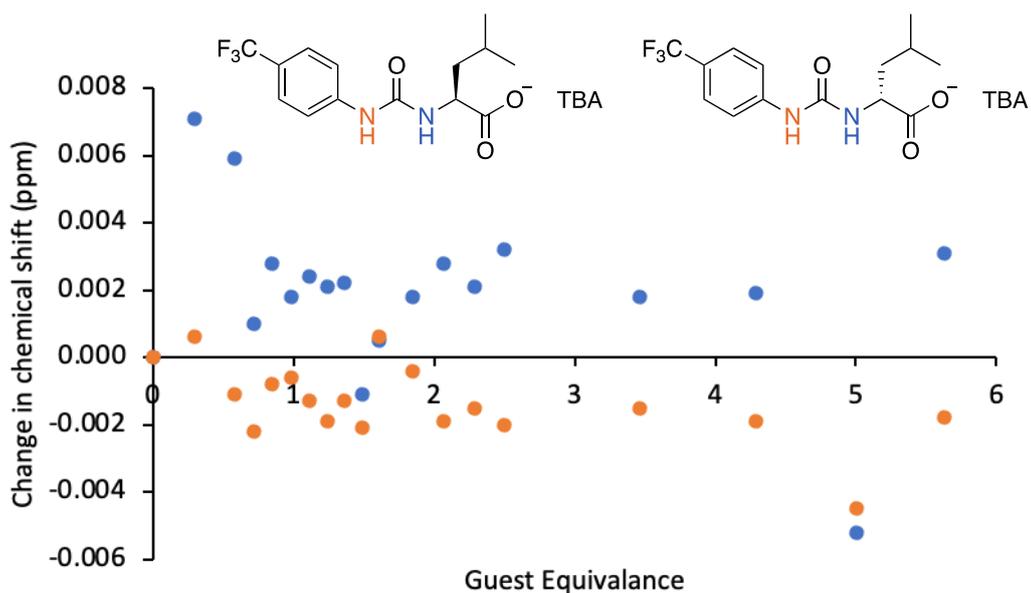

Figure S126 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for a 1:1 enantiomeric mixture of **3** + **5** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **3** and **5**. The data could not be fitted as the change in chemical shift is less than 0.01 ppm.

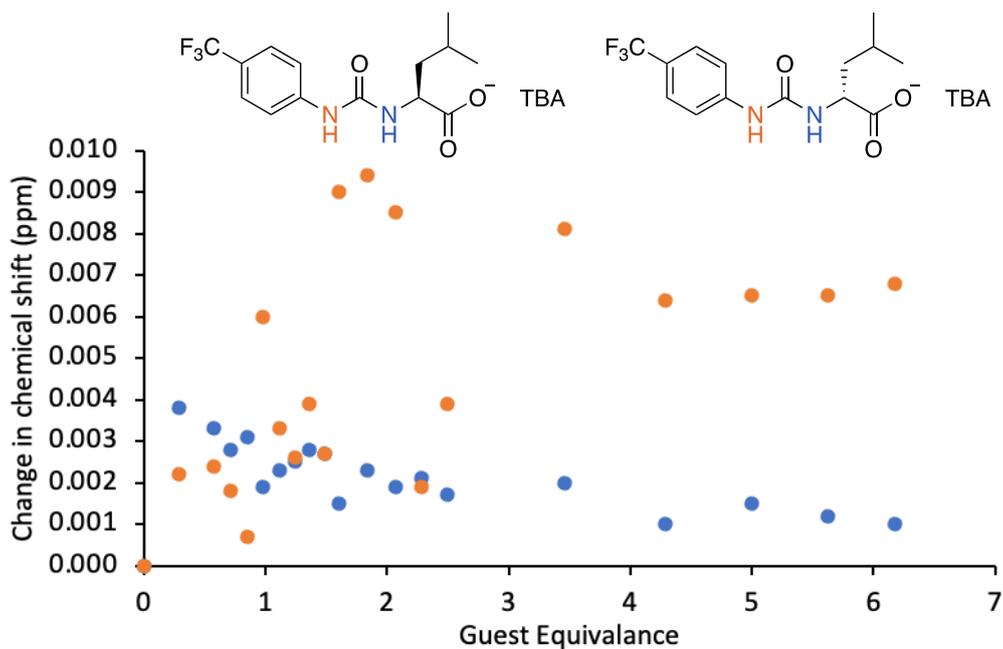

Figure S127 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for a 1:1 enantiomeric mixture of **3** + **5** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **3** and **5**. The data could not be fitted as the change in chemical shift is less than 0.01 ppm.

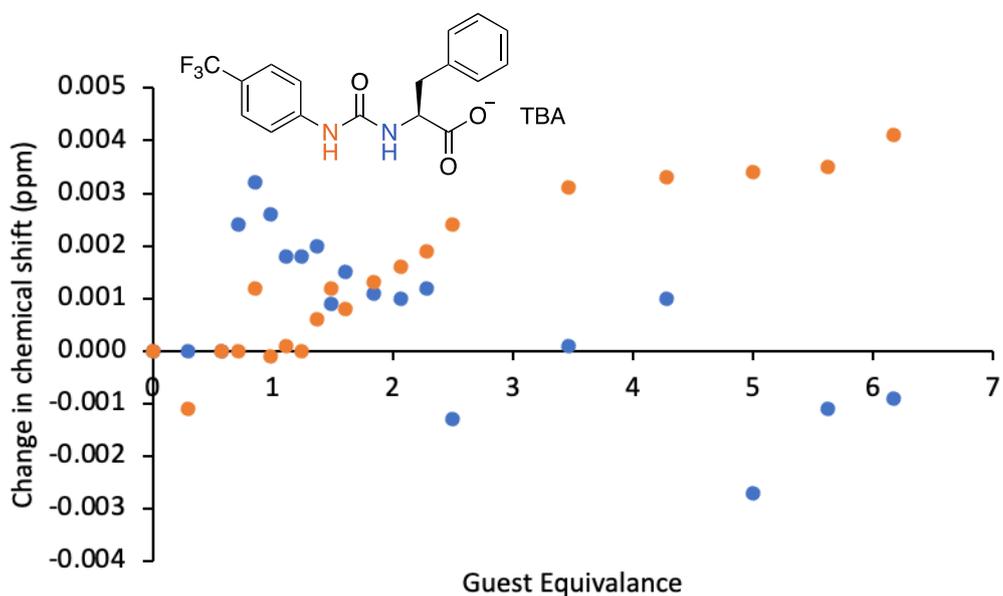

Figure S128 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **7** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from the urea NH resonances in **7**. The data could not be fitted as it is below the limit of detection of the NMR machine.

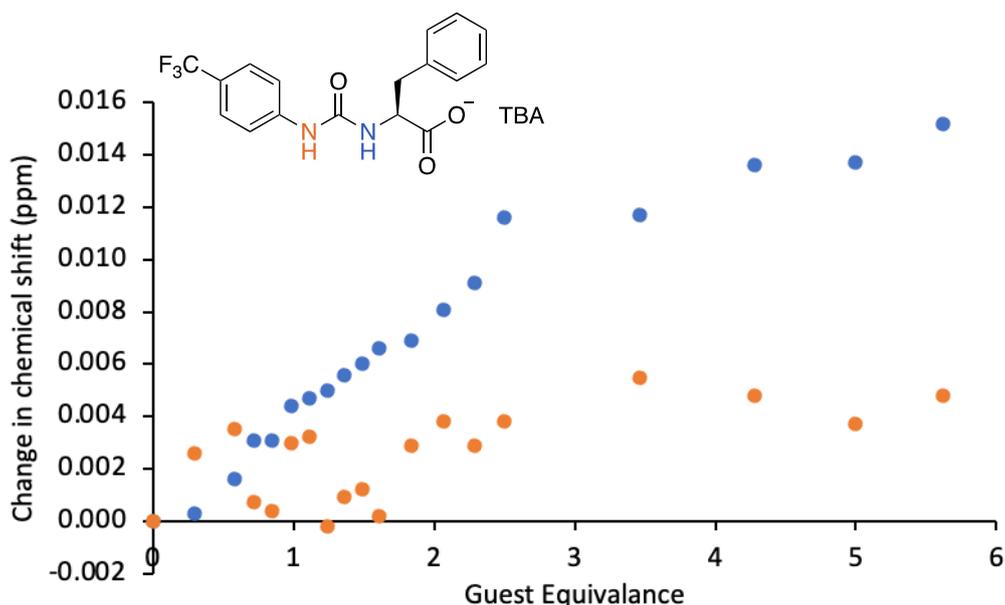

Figure S129 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **7** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from only one urea NH resonance in **7**, as the other NH has change in chemical shift is less than 0.01 ppm. The data was fit to a 1:1 binding isotherm (Nelder-Mead fit):

$$K_a = 30.27 \text{ M}^{-1} \pm 7.50 \%$$

<http://app.supramolecular.org/bindfit/view/b7f02191-544b-4a16-9268-e2474ada3bdf>

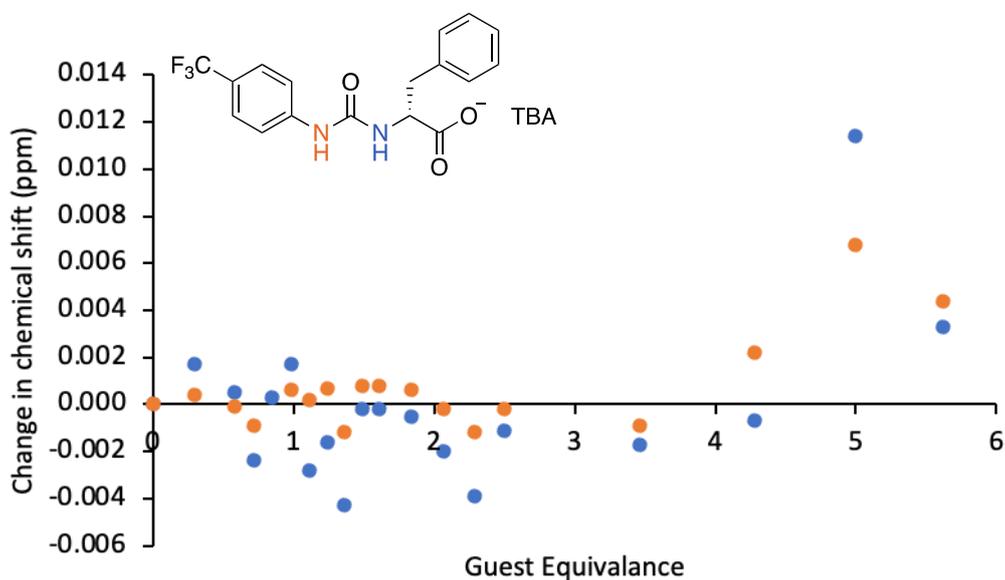

Figure S130 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **9** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from both urea NH resonances in **9**. The data could not be fitted as it is below the limit of detection of the NMR machine.

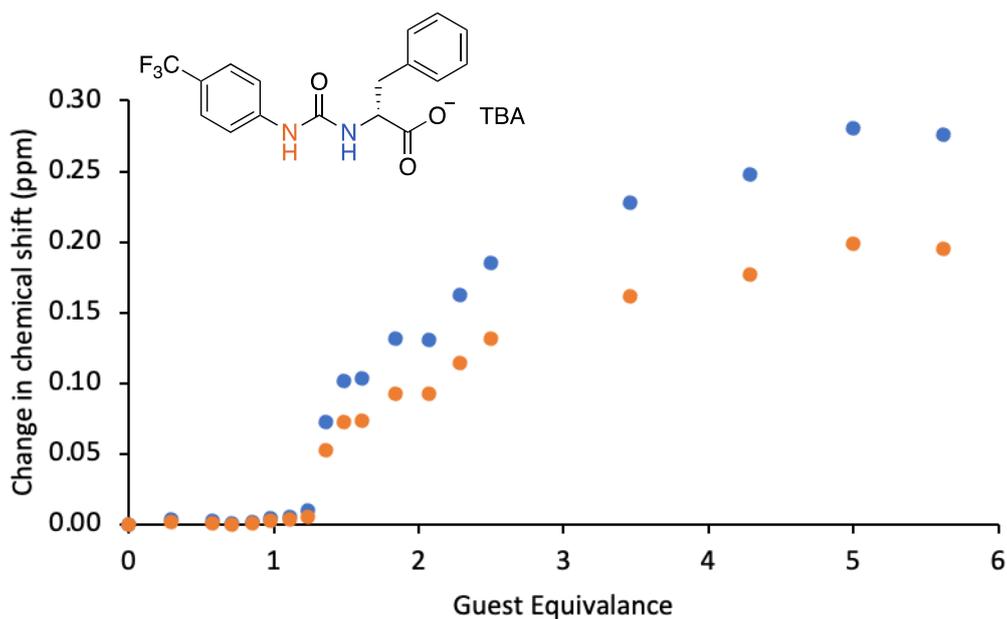

Figure S131 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for **9** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from both urea NH resonances in **9** and fit to a 1:1 binding isotherm (Nelder-Mead fit):

<http://app.supramolecular.org/bindfit/view/14610503-0cd1-4c7c-945c-da1bf465e2dd>

The data was then fit to a 2:1 (guest:host) binding isotherm (Nelder-Mead fit):

<http://app.supramolecular.org/bindfit/view/d1a599b4-ee96-4019-b8f9-6f6c64fd1c34>

No association constants are reported for the formation of any complex due to the high error calculated for the fit of these data, or the trend of these data failing to fit any ideal predicted trends.

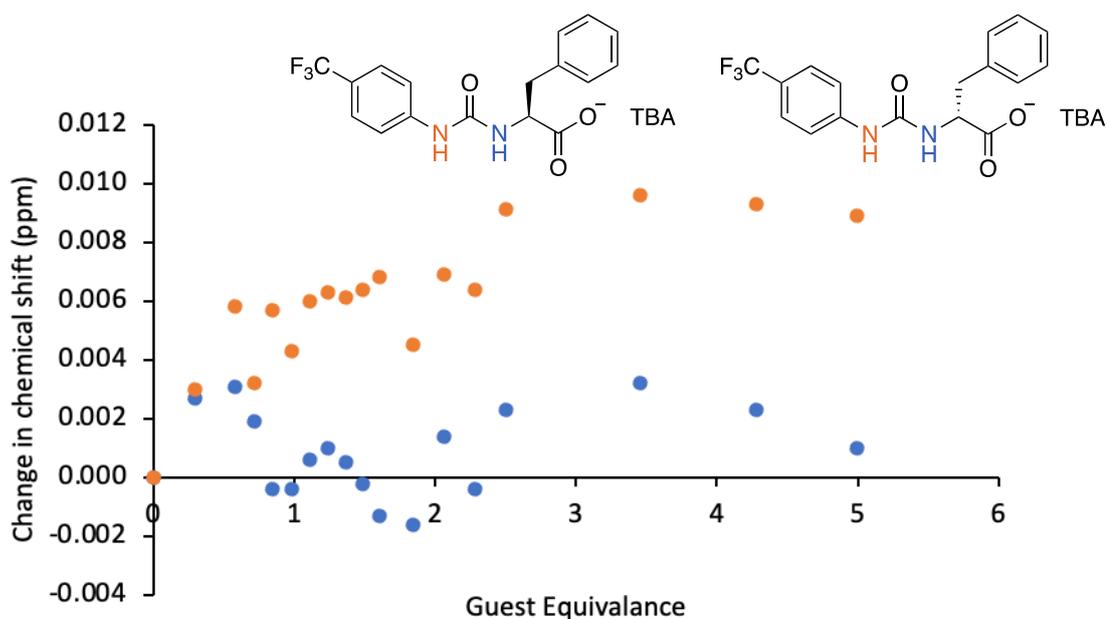

Figure S132 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for a 1:1 enantiomeric mixture of **7** + **9** with increasing concentration of TBACl in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from both urea NH resonances in **7** and **9**. The data could not be fitted as the change in chemical shift is less than 0.01 ppm.

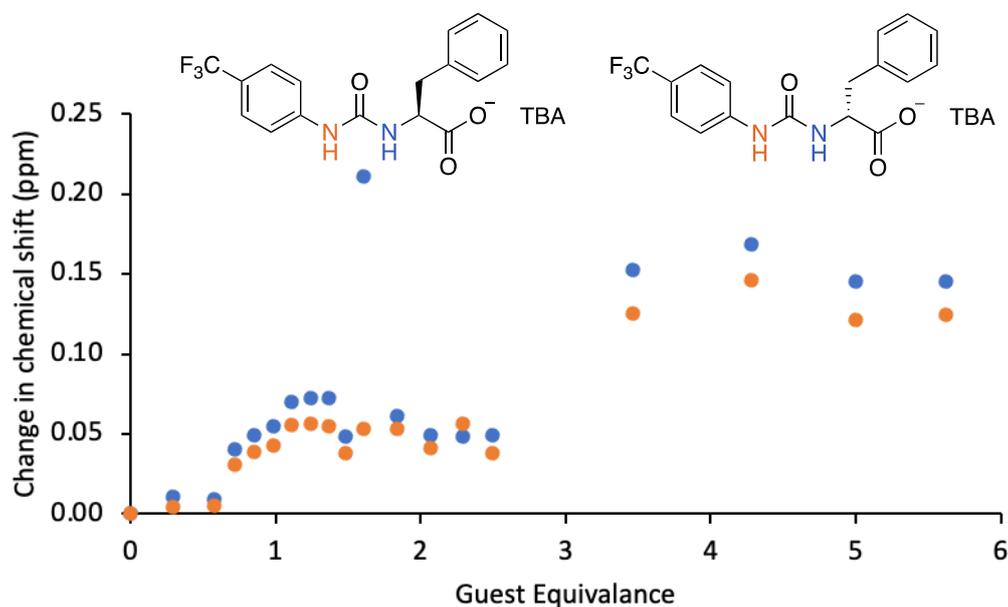

Figure S133 - Graph illustrating the ^1H NMR down-field change in chemical shift of urea NH resonances for a 1:1 enantiomeric mixture of **7** + **9** with increasing concentration of TBAH_2PO_4 in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ (298 K).

Association constant calculation: values were calculated from data gathered from both urea NH resonances in **7** and **9** and fit to a 1:1 binding isotherm (Nelder-Mead fit):

<http://app.supramolecular.org/bindfit/view/e8f619f2-545b-4a4d-9a97-f74c5df1a603>

The data was then fit to a 2:1 (guest:host) binding isotherm (Nelder-Mead fit):

<http://app.supramolecular.org/bindfit/view/b8b35088-97ef-4f84-abf0-91d82174e736>

No association constants are reported for the formation of any complex due to the high error calculated for the fit of these data, or the trend of these data failing to fit any ideal predicted trends.

Summary

Table S13 - Summary of association constants (K_a) calculated from ^1H NMR titration data, using Bindfit v0.5,¹ conducted in $\text{DMSO-}d_6/0.5\% \text{H}_2\text{O}$ at 298 K. Anionic guest species were supplied as the TBA salt. Data was fitted to both 1:1, 1:2 and 2:1 binding isotherm.

Comparative error analysis confirmed the 1:1 binding isotherm to demonstrate the highest level of confidence when fitted to these data, unless otherwise indicated.

Host	Guest	K_a (M^{-1})	Error (\pm %)
1	Cl^-	4.33	6.19
1	H_2PO_4^-	12.59	1.77
3	Cl^-	<i>b</i>	<i>b</i>
3	H_2PO_4^-	<i>b</i>	<i>b</i>
5	Cl^-	<i>b</i>	<i>b</i>
5	H_2PO_4^-	<i>c</i>	<i>c</i>
3+5 ^a	Cl^-	<i>b</i>	<i>b</i>
3+5 ^a	H_2PO_4^-	<i>b</i>	<i>b</i>
7	Cl^-	<i>b</i>	<i>b</i>
7	H_2PO_4^-	30.27	7.50
9	Cl^-	<i>b</i>	<i>b</i>
9	H_2PO_4^-	<i>c</i>	<i>c</i>
7+9 ^a	Cl^-	<i>b</i>	<i>b</i>
7+9 ^a	H_2PO_4^-	<i>c</i>	<i>c</i>

a – 1:1 mixture.

b – No evidence of host: guest complex formation detected.

c – Data could not be fitted with a high degree of confidence to any binding model (error > $\pm 15\%$).

Section S17: Ion transport studies

Cl⁻/NO₃⁻ antiport Hill plots – pH 7.2

Internal buffer: 500 mM NaCl buffered to pH 7.2 with 5 mM sodium phosphate salts.

External buffer: 500 mM NaNO₃ buffered to pH 7.2 with 5 mM sodium phosphate salts.

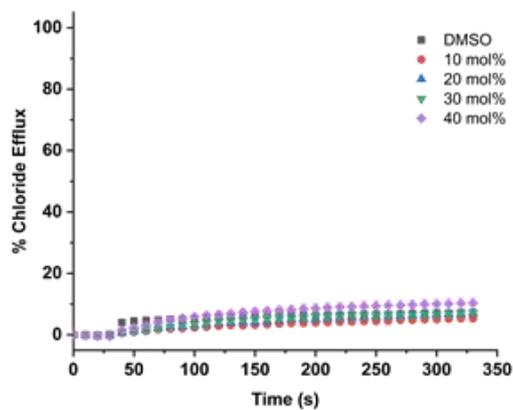

Figure S134 - Transport data for the Cl⁻/NO₃⁻ antiport Hill plot experiment with compound **1**. Full Hill analysis was not performed due to the low observed activity of this compound.

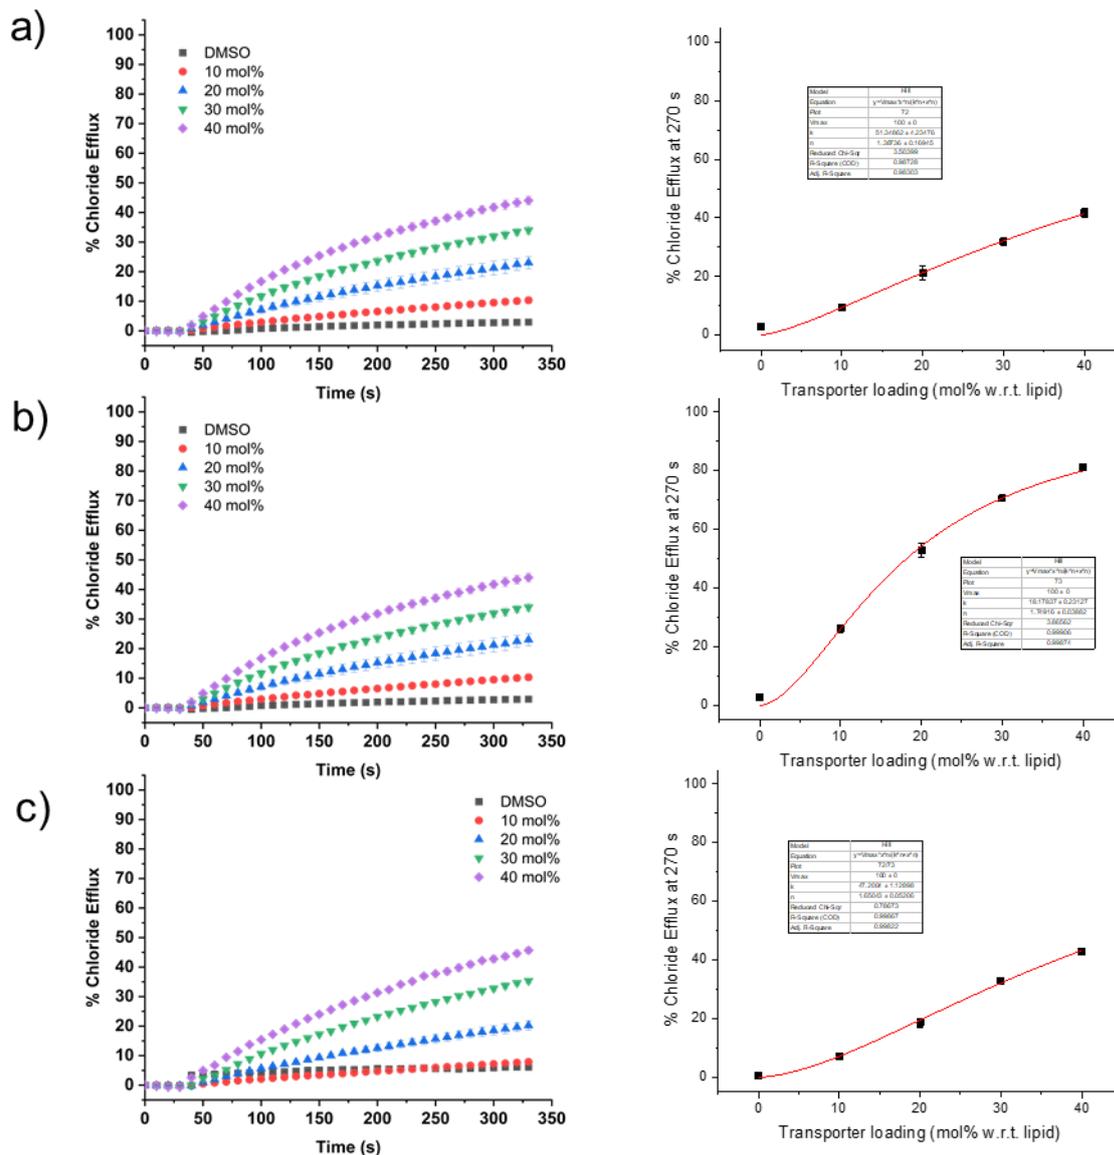

Figure S135 - Transport data and Hill analyses for the Cl⁻/NO₃⁻ antiport experiment with compounds: a) **3**, b) **5** and c) a racemic mixture of **3** and **5**.

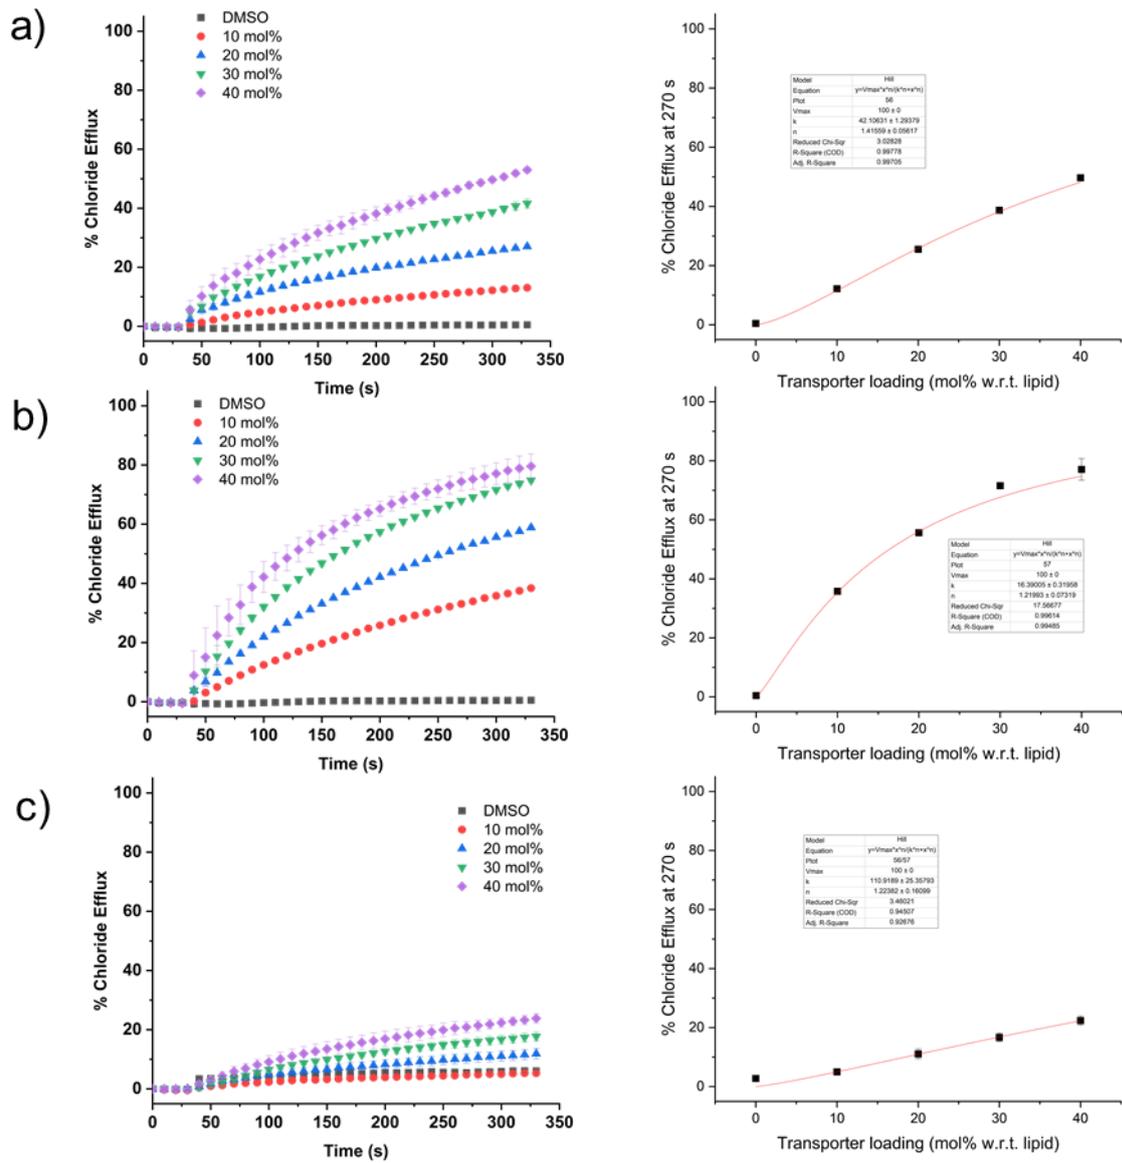

Figure S136 - Transport data and Hill analyses for the $\text{Cl}^-/\text{NO}_3^-$ antiport experiment with compounds: a) **7**, b) **9** and c) a racemic mixture of **7** and **9**.

Control experiments

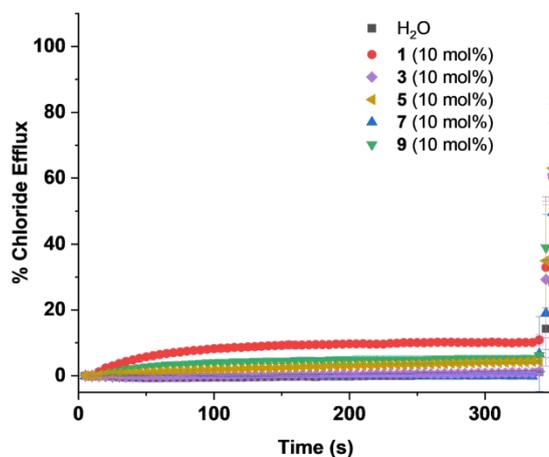

Figure S137 - Cl⁻/NO₃⁻ antiport experiment with compounds **1**, **3**, **5**, **7** and **9** (10 mol%) added from a stock solution in H₂O (5 mM).

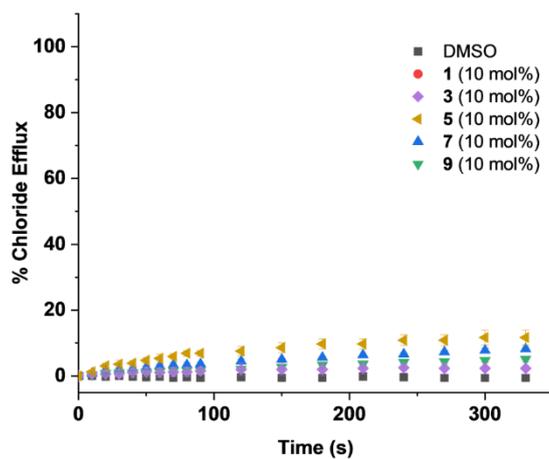

Figure S138 - Chloride efflux mediated by compounds **1**, **3**, **5**, **7** and **9** (10 mol%) from a stock solution in DMSO (5 mM). The transporter was added to vesicles containing 489 mM NaCl buffered to pH 7.2 with 5 mM sodium phosphate salts, which were suspended in 167 mM Na₂SO₄ buffered to pH 7.2 with 5 mM sodium phosphate salts.

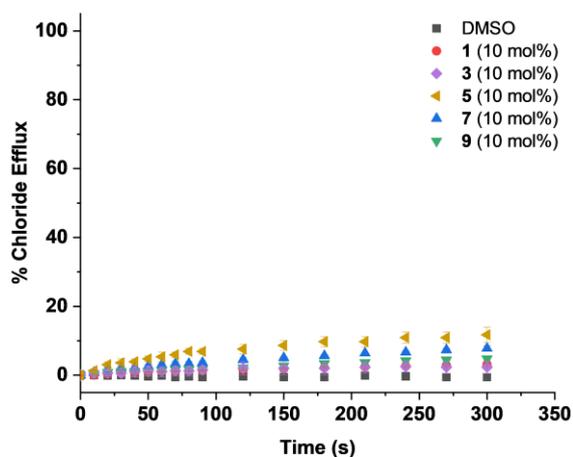

Figure S139 - Chloride efflux mediated by compounds **1**, **3**, **5**, **7** and **9** (10 mol%) from a stock solution in DMSO (5 mM). The transporter was added to vesicles containing 489 mM NaCl buffered to pH 4 with 5 mM sodium citrate salts, which were suspended in 167 mM Na₂SO₄ buffered to pH 7.2 with 5 mM sodium phosphate salts.

Summary

Table S14 – a summary of the results of the Hill analyses of compounds **1**, **3**, **5**, **7** and **9** in Cl⁻/NO₃⁻ antiport experiments. EC₅₀ is the effective concentration of transporter required to mediate 50% chloride efflux after 270 s; *n* is the Hill coefficient; n.d. = not determined due to the low observed activity of the transporter. Errors were derived from fitting the data using Origin 2019.

Compound	pH 7.2			
	EC ₅₀	± Error	<i>n</i>	± Error
1	<i>b</i>	n.a.	<i>b</i>	n.a.
3	51.3	4.2	1.4	0.2
5	18.2	0.2	1.7	0.04
3+5 ^a	47.2	1.1	1.7	0.05
7	42.1	1.3	1.4	0.06
9	16.4	0.3	1.3	0.07
7+9 ^a	111	25.3	1.2	0.16

^a – 1:1 mixture. *b* – not determined.

Section S18: MIC determination assay

Table S15 – The minimum inhibitory concentration (MIC) values determined for **1**, **3**, **5**, **7**, **9**, and 1:1 enantiomeric mixtures of **3** + **5** and **7** + **9** against 7 different Gram-positive *Staphylococcus aureus* (*S. aureus*), *Enterococcus faecalis* (*E. faecalis*) and *Enterococcus faecium* (*E. faecium*) bacteria strains. Here, the MIC is the lowest concentration at which no visible growth was observed.

Compound	MIC (mM)						
	<i>S. aureus</i> 9144	<i>S. aureus</i> 13616	<i>S. aureus</i> USA 300	<i>S. aureus</i> 1199B	<i>E. Faecalis</i> NCTC 775	<i>E. Faecalis</i> NCTC 12201	<i>E. Faecium</i> NCTC 12204

^a – 1:1 mixture.

Section S19: GI₅₀ determination assays

RPE-1 cell line

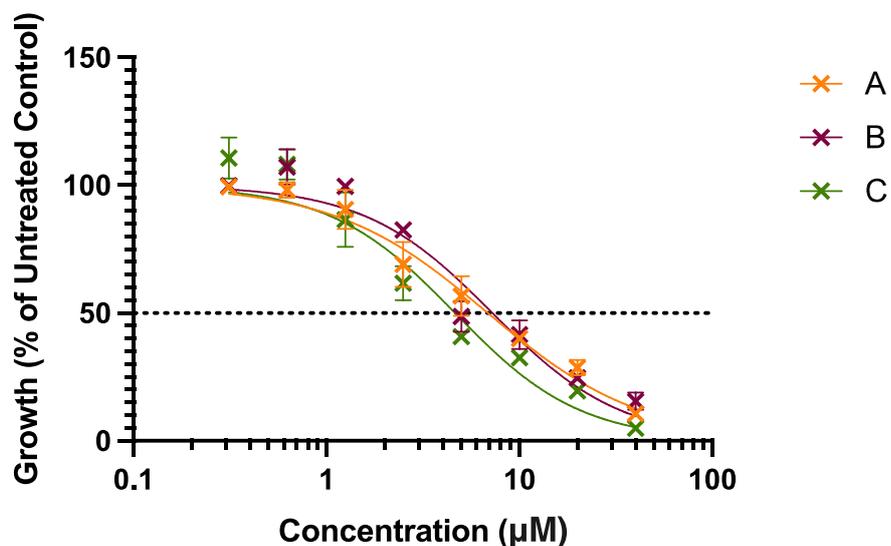

Figure S140 - Graph showing the effects of cisplatin on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

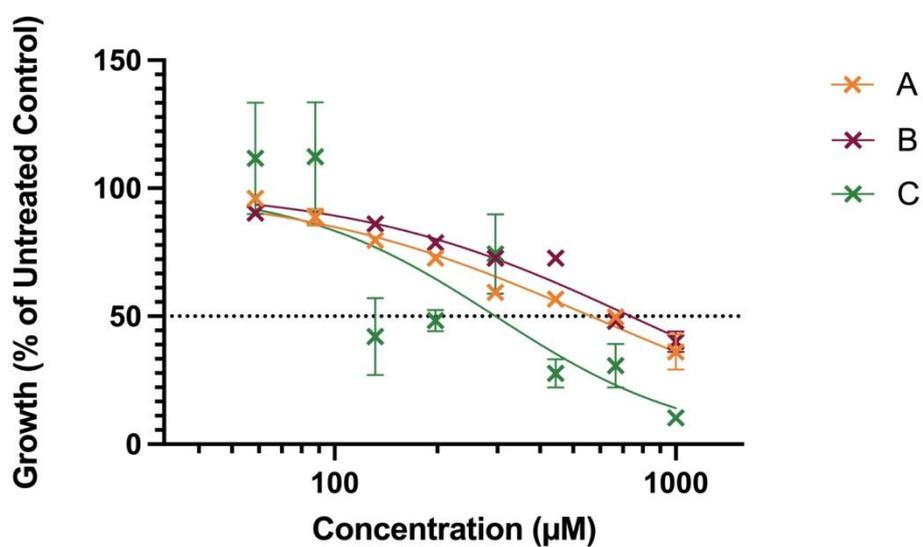

Figure S141 - Graph showing the effects of TBACl on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 30/01/2022; B = 31/01/2022; C = 27/03/2024.

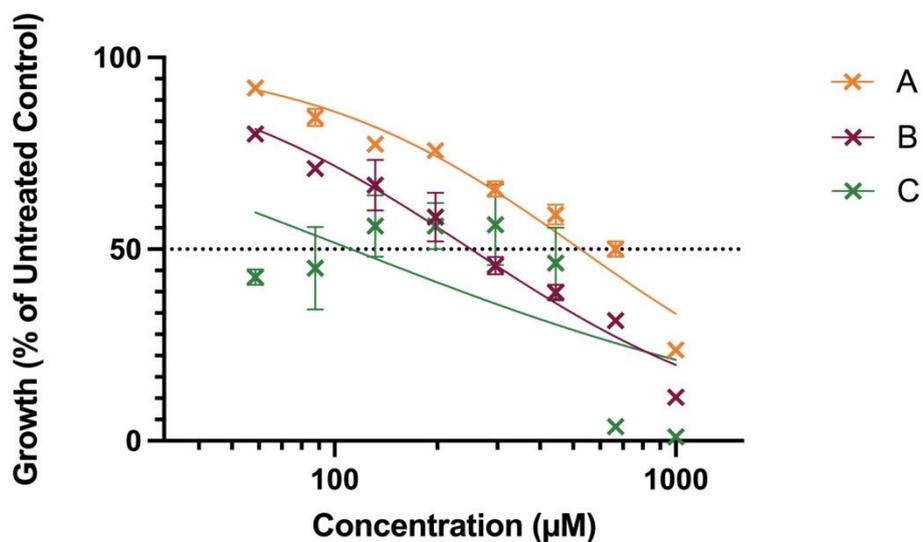

Figure S142 - Graph showing the effects of **1** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 30/01/2022; B= 31/01/2022; C = 27/03/2024.

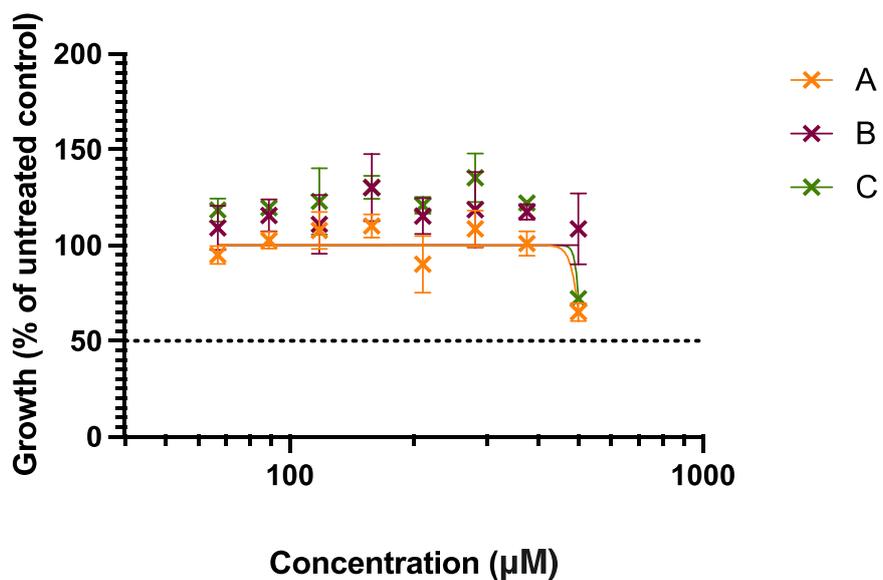

Figure S143 - Graph showing the effects of **3** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

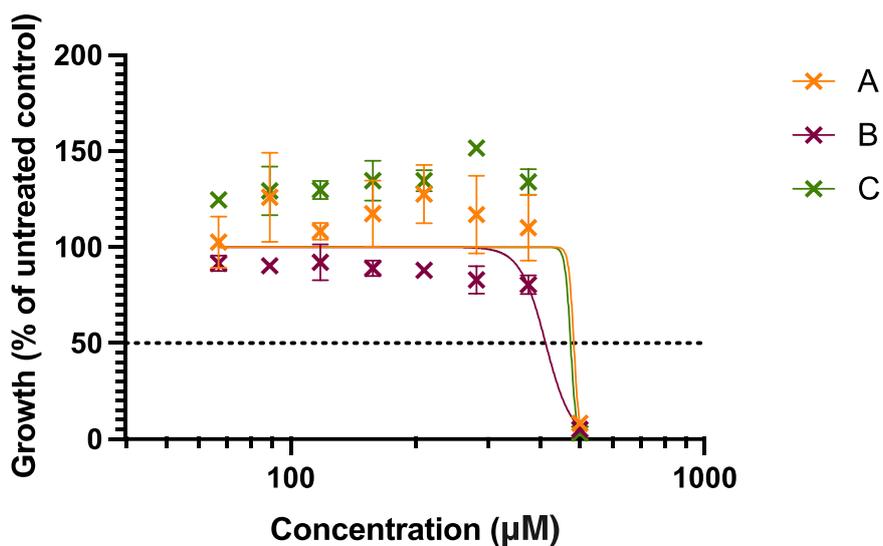

Figure S144 - Graph showing the effects of **5** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

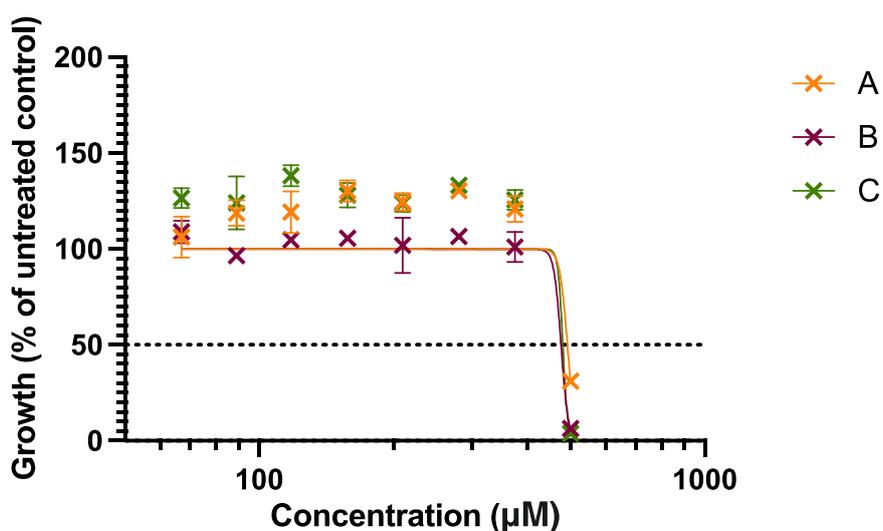

Figure S145 - Graph showing the effects of a 1:1 enantiomeric mixture of **3 + 5** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

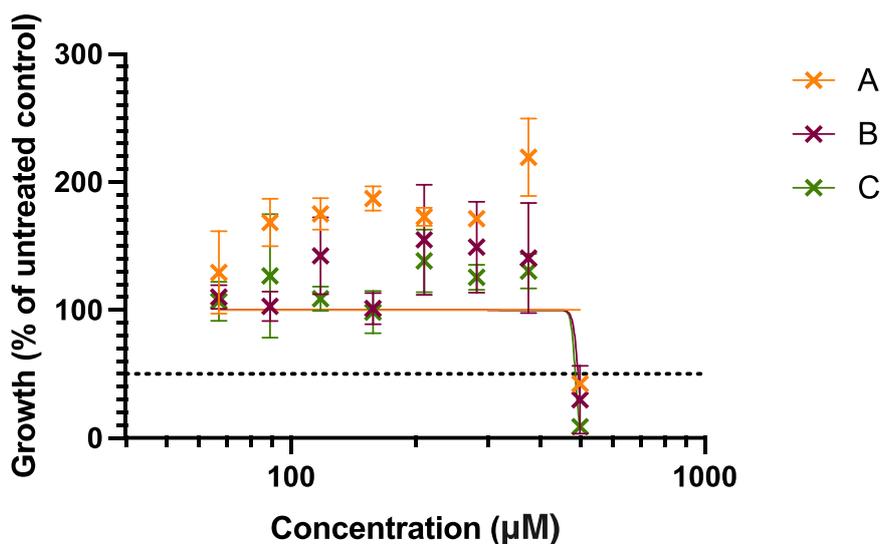

Figure S146 - Graph showing the effects of **7** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

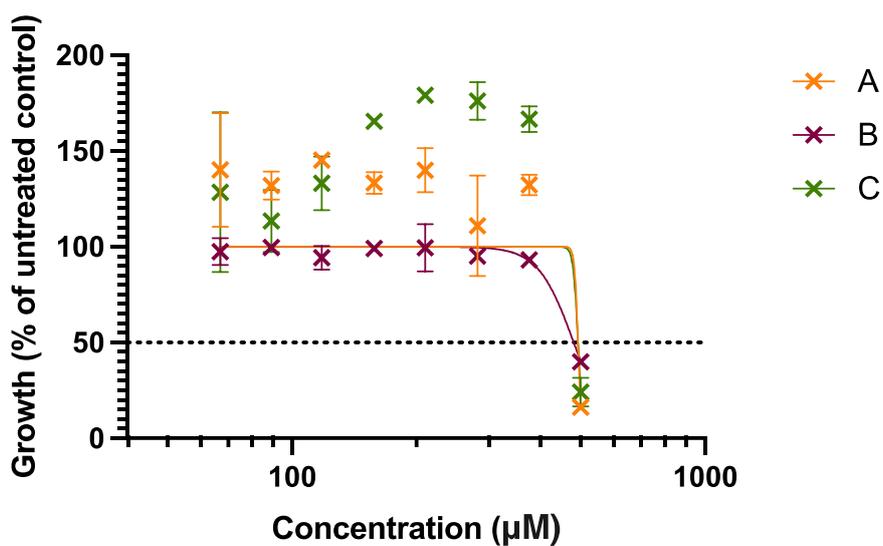

Figure S147 - Graph showing the effects of **9** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

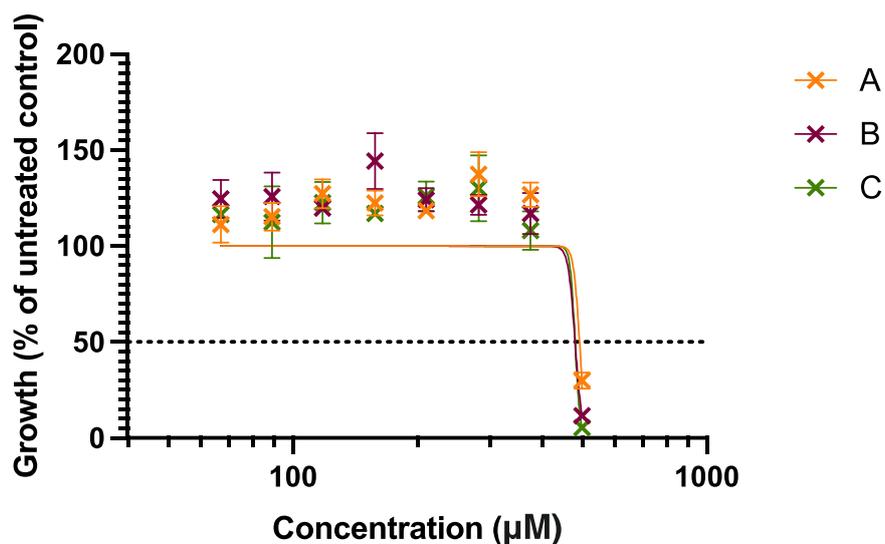

Figure S148 - Graph showing the effects of a 1:1 enantiomeric mixture of **7** + **9** on RPE-1 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 14/11/2023; B = 16/11/2023; C = 21/11/2023.

A2780 cell line

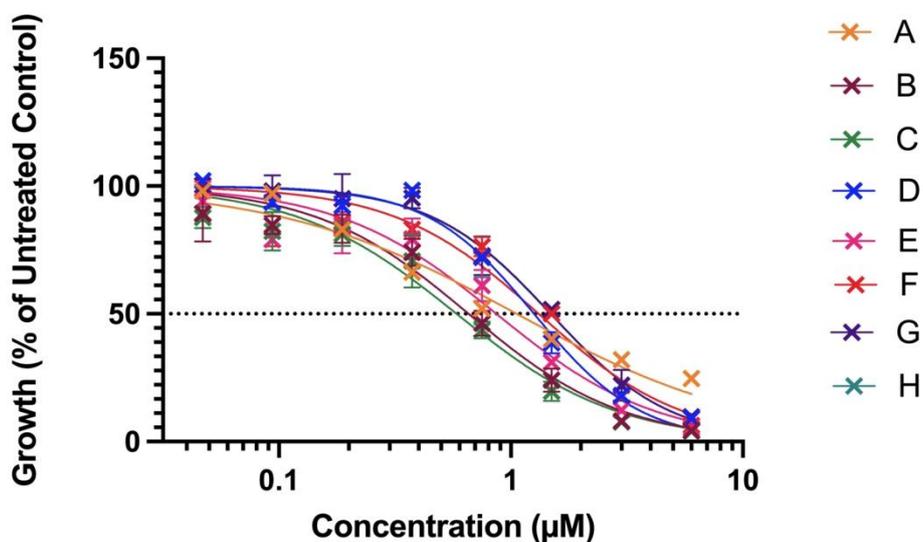

Figure S149 – Graph showing the effects of cisplatin on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents eight separate experiments: A = 28/11/2021; B = 07/06/2022; C = 08/06/2022; D = 20/01/2023; E = 05/03/2023; F = 28/07/2023; G = 23/02/2024; H = 24/02/2024.

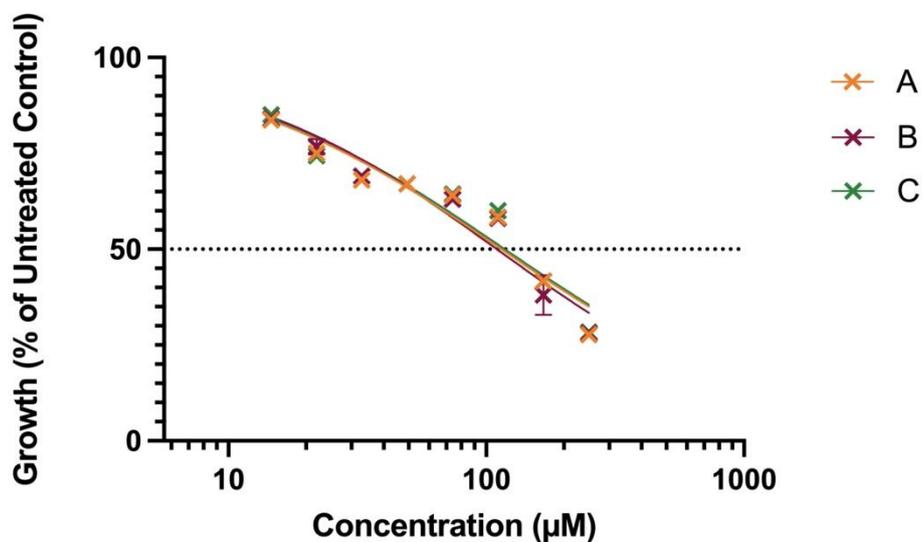

Figure S150 – Graph showing the effects of TBACl on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 20/12/2021; B = 09/01/2022; C = 10/01/2022.

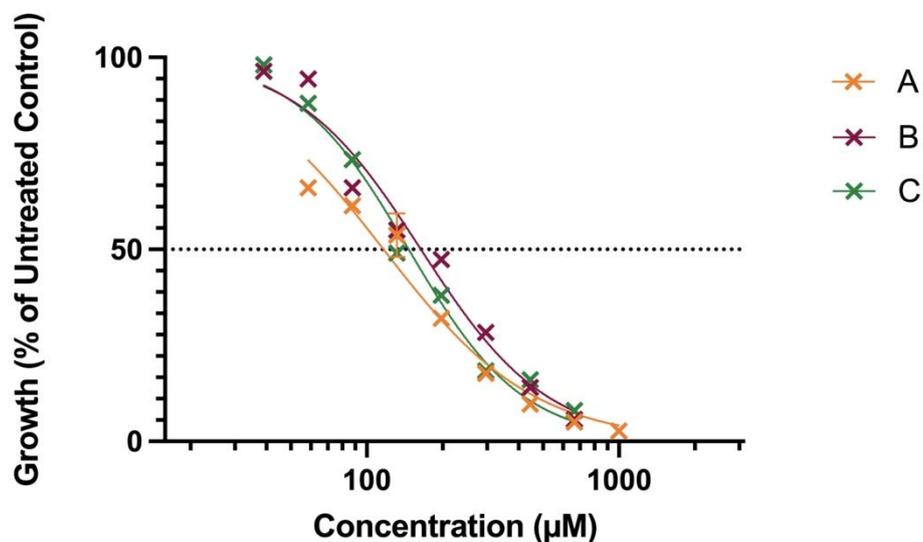

Figure S151 – Graph showing the effects of **1** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 21/11/2021; B = 28/11/2021; C = 30/11/2021.

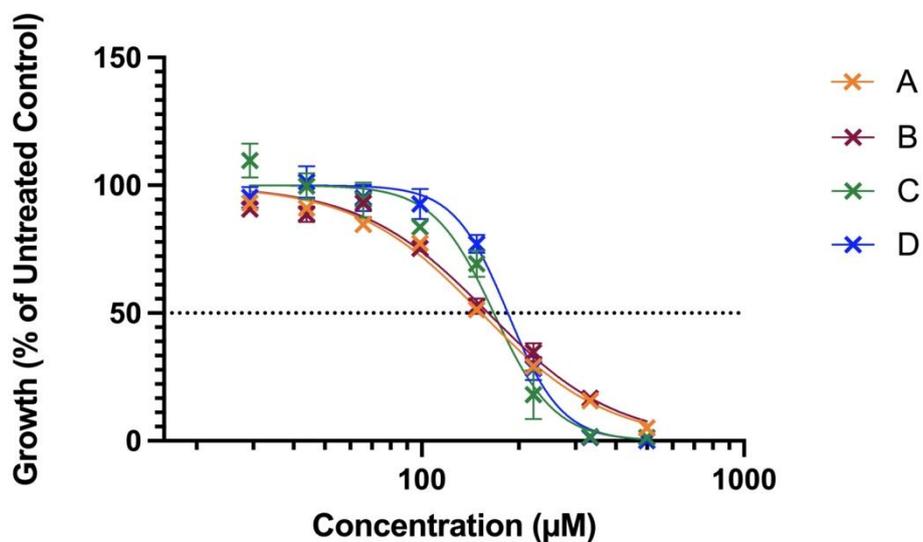

Figure S152 – Graph showing the effects of **3** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents four separate experiments: A = 21/07/2023; B = 22/07/2023; C = 23/02/2024; D = 26/02/2024.

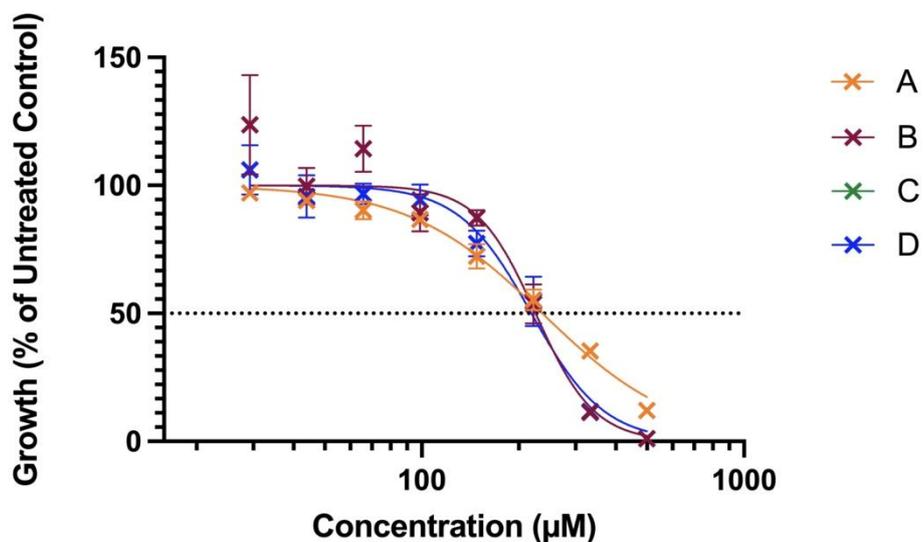

Figure S153 – Graph showing the effects of **5** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents four separate experiments: A = 21/07/2023; B = 22/07/2023; C = 23/02/2024; D = 26/02/2024.

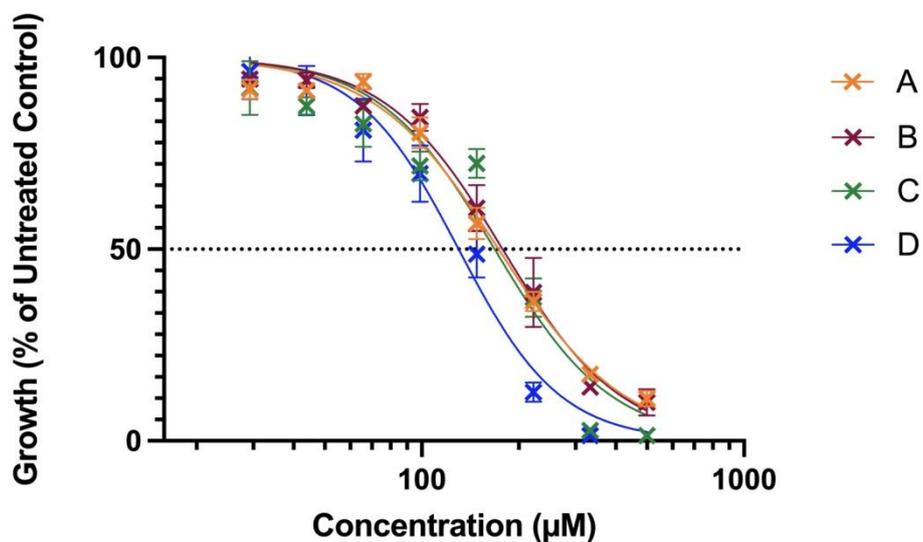

Figure S154 – Graph showing the effects of a 1:1 enantiomeric mixture of **3** + **5** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents four separate experiments: A = 21/07/2023; B = 22/07/2023; C = 23/02/2024; D = 26/02/2024.

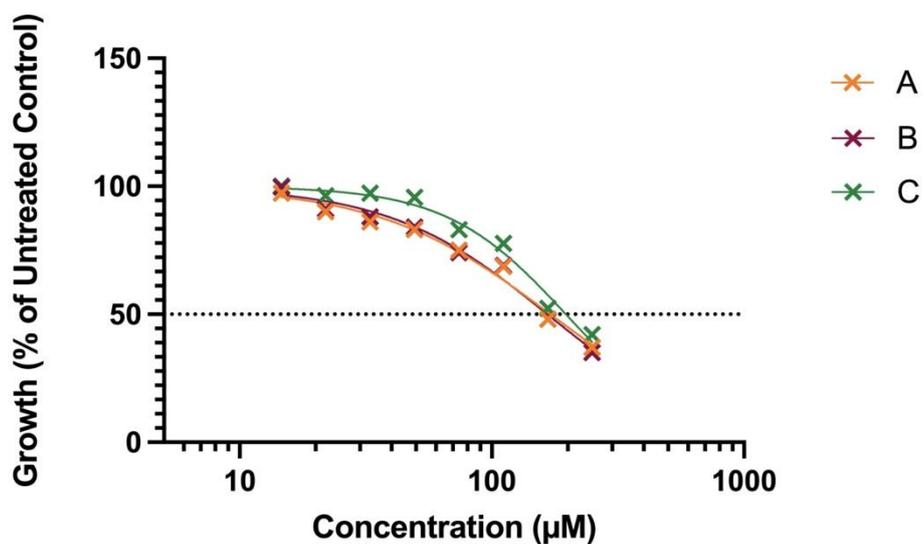

Figure S155 – Graph showing the effects of **7** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 20/12/2021; B = 09/01/2022; C = 10/01/2022.

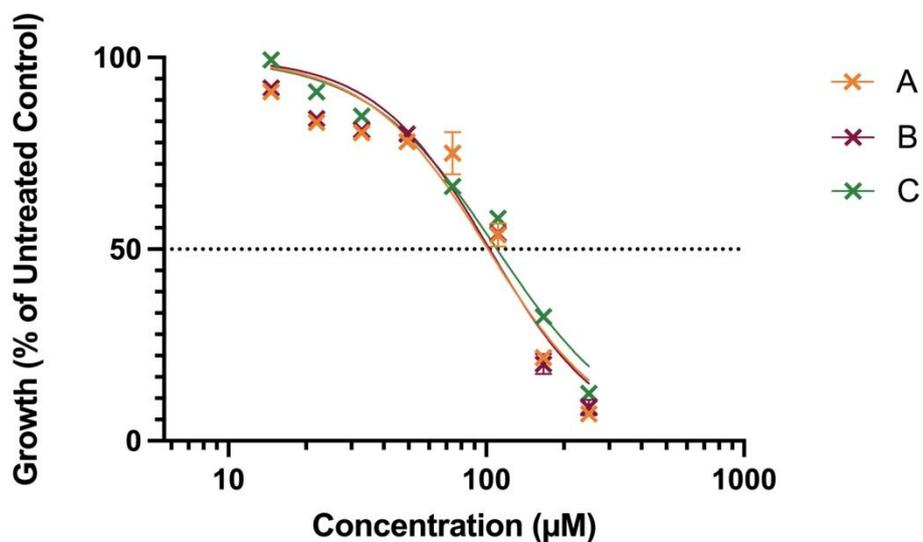

Figure S156 – Graph showing the effects of **9** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 19/12/2021; B = 09/01/2022; C = 10/01/2022.

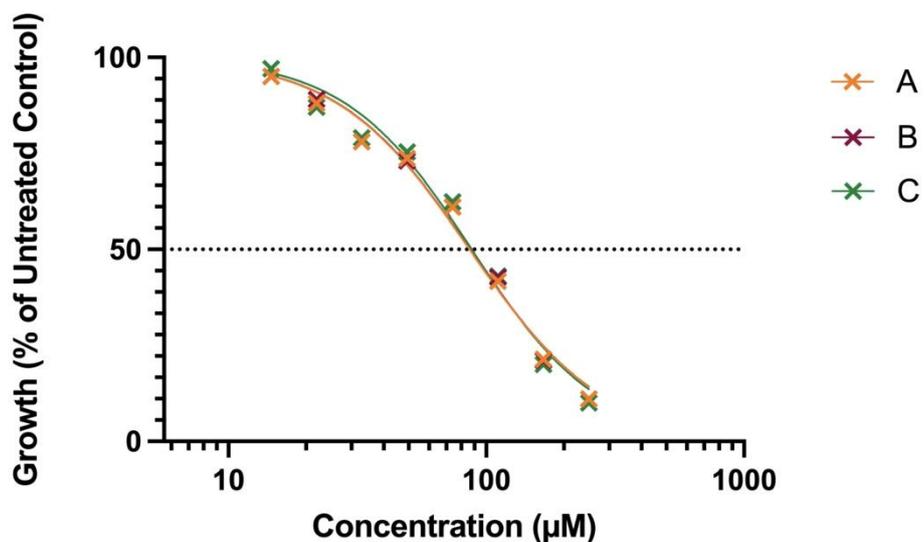

Figure S157 – Graph showing the effects of a 1:1 enantiomeric mixture of **7** + **9** on A2780 cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 19/12/2021; B = 09/01/2022; C = 10/01/2022.

A2780 CisR cell line

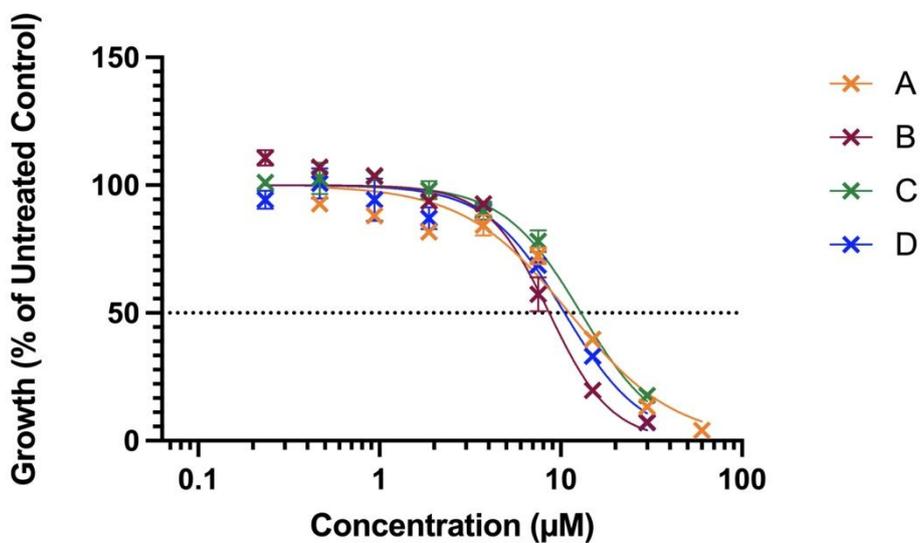

Figure S158 – Graph showing the effects of cisplatin on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents four separate experiments: A = 28/11/2021; B = 08/03/2023; C = 11/04/2023; D = 29/11/2023.

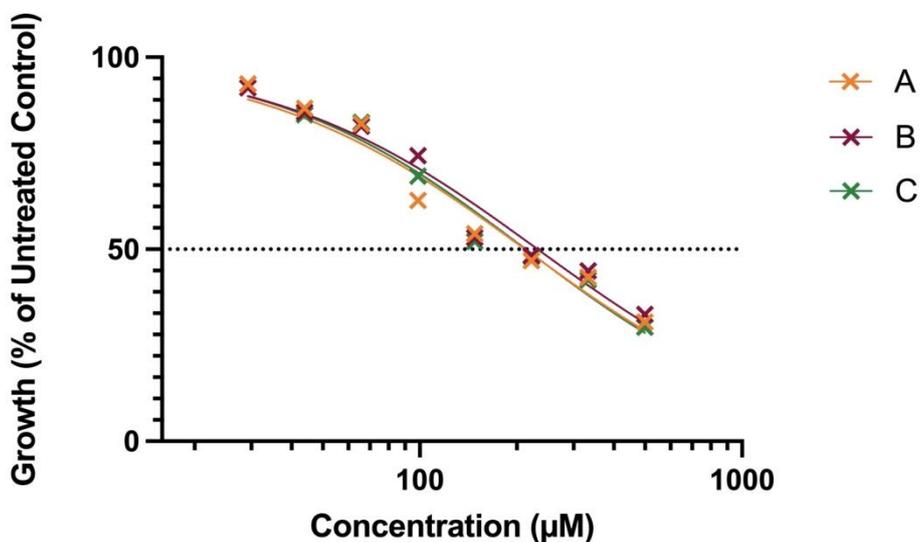

Figure S159 – Graph showing the effects of TBACl on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 19/12/2021; B = 20/12/2021; C = 09/01/2022.

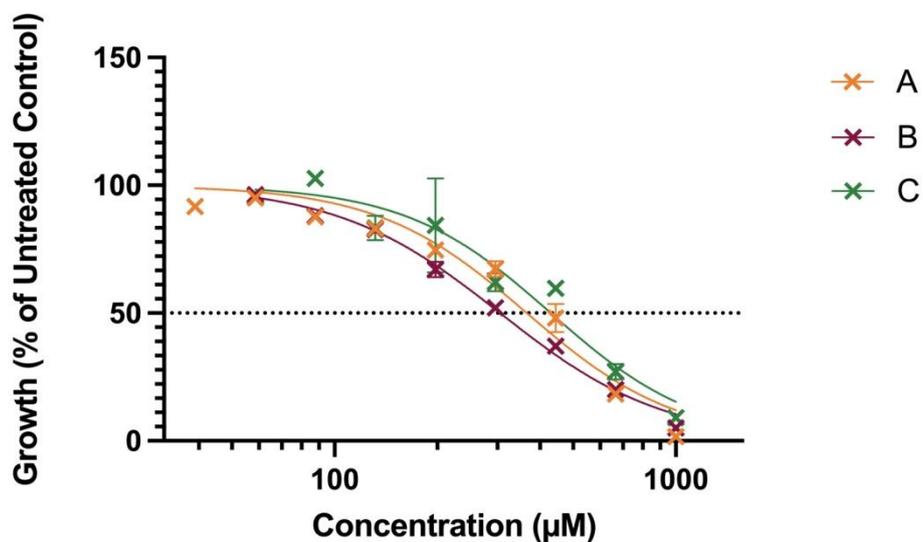

Figure S160 – Graph showing the effects of **1** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 08/11/2021; B = 28/11/2021; C = 14/12/2021.

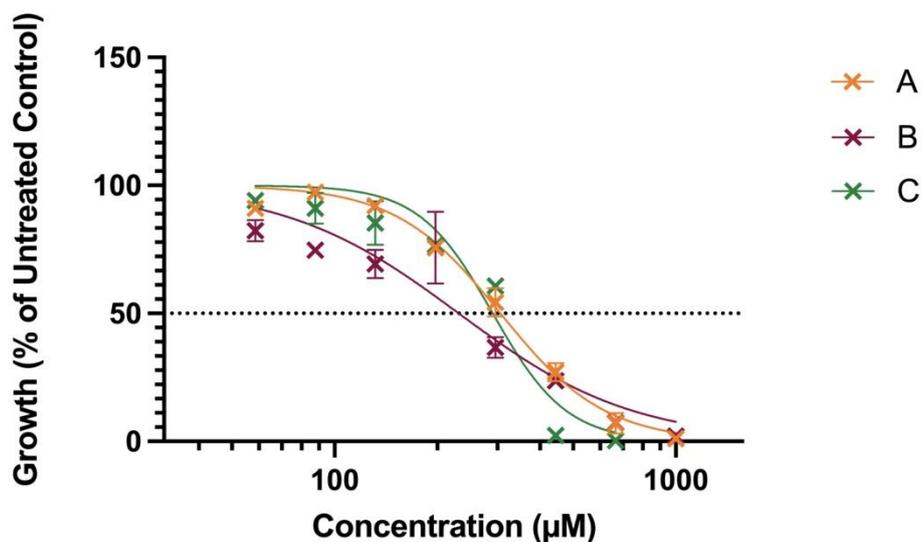

Figure S161 – Graph showing effects of **3** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 26/11/2023; B = 29/11/2023; C = 13/02/2024.

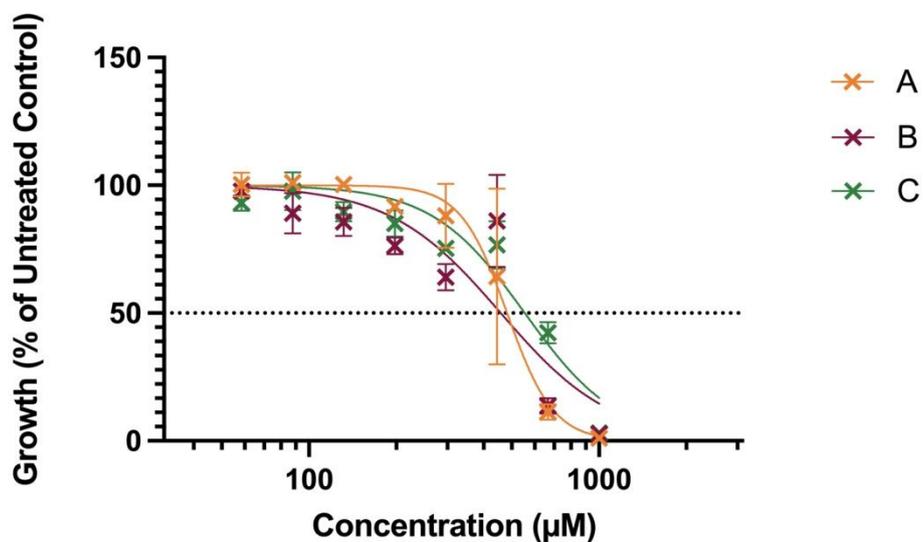

Figure S162 – Graph showing the effects of **5** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 26/11/2023; B = 29/11/2023; C = 13/02/2024.

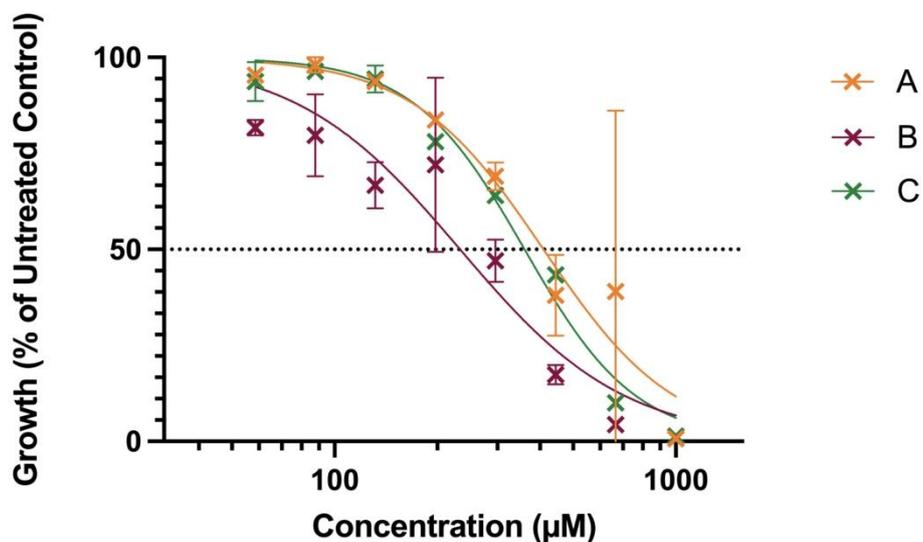

Figure S163 – Graph showing effects of a 1:1 enantiomeric mixture of **3 + 5** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 26/11/2023; B = 29/11/2023; C = 13/02/2024.

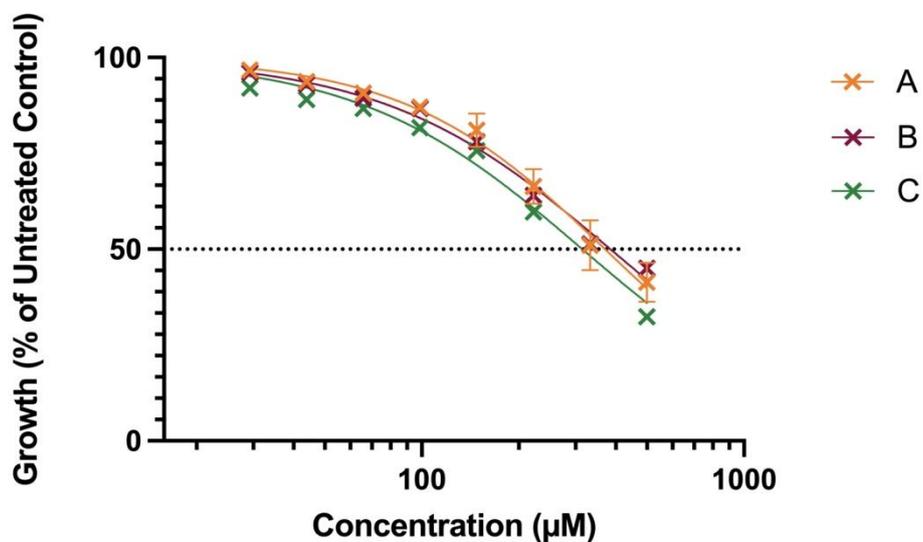

Figure S164 – Graph showing effects of **7** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 19/12/2021; B = 20/12/2021; C = 09/01/2022.

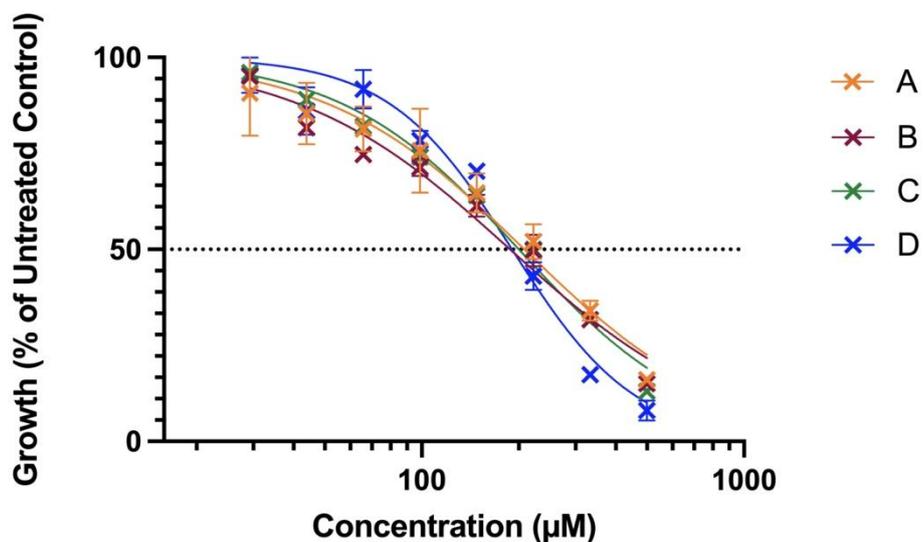

Figure S165 – Graph showing effects of **9** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents four separate experiments: A = 19/12/2021; B = 20/12/2021; C = 09/01/2022; D = 10/01/2022.

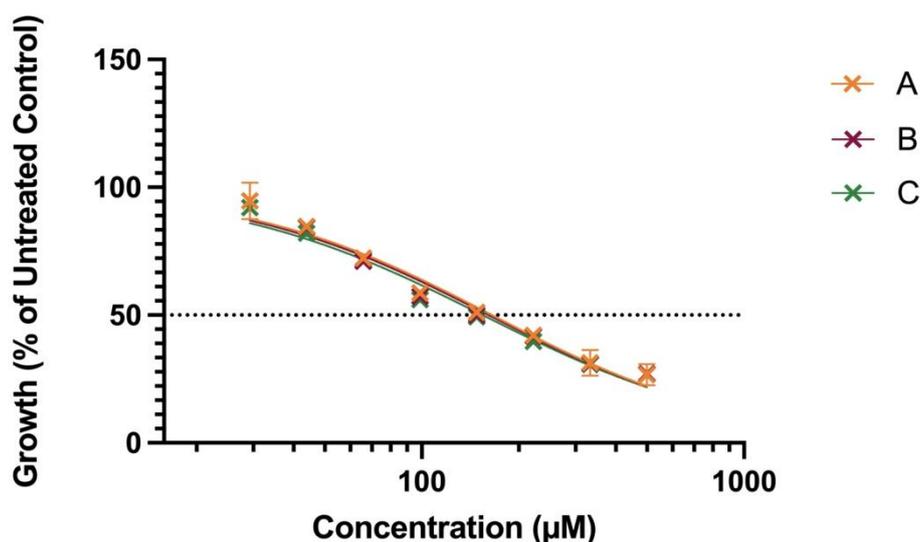

Figure S166 – Graph showing the effects of a 1:1 enantiomeric mixture of **7** + **9** on A2780 CISR cells after a 96-hour incubation period followed by analysis as per SRB assay. The data shown represents three separate experiments: A = 19/12/2021; B = 20/12/2021; C = 09/01/2022.

Summary

Table S16 - The concentration required to reduce/ inhibit cellular growth by 50 % (GI₅₀) determined for cisplatin, TBACl, **1**, **3**, **5**, **7**, **9**, and 1:1 enantiomeric mixtures of **3** + **5** and **7** + **9** against non-cancerous RPE-1 cells, ovarian cancer cells (A2780) and cisplatin resistant ovarian cancer cells (A2780 CisR).

Compound	RPE-1 SRB Assays			A2780 SRB Assays			A2780 CisR SRB Assays

Changing concentration of **1**

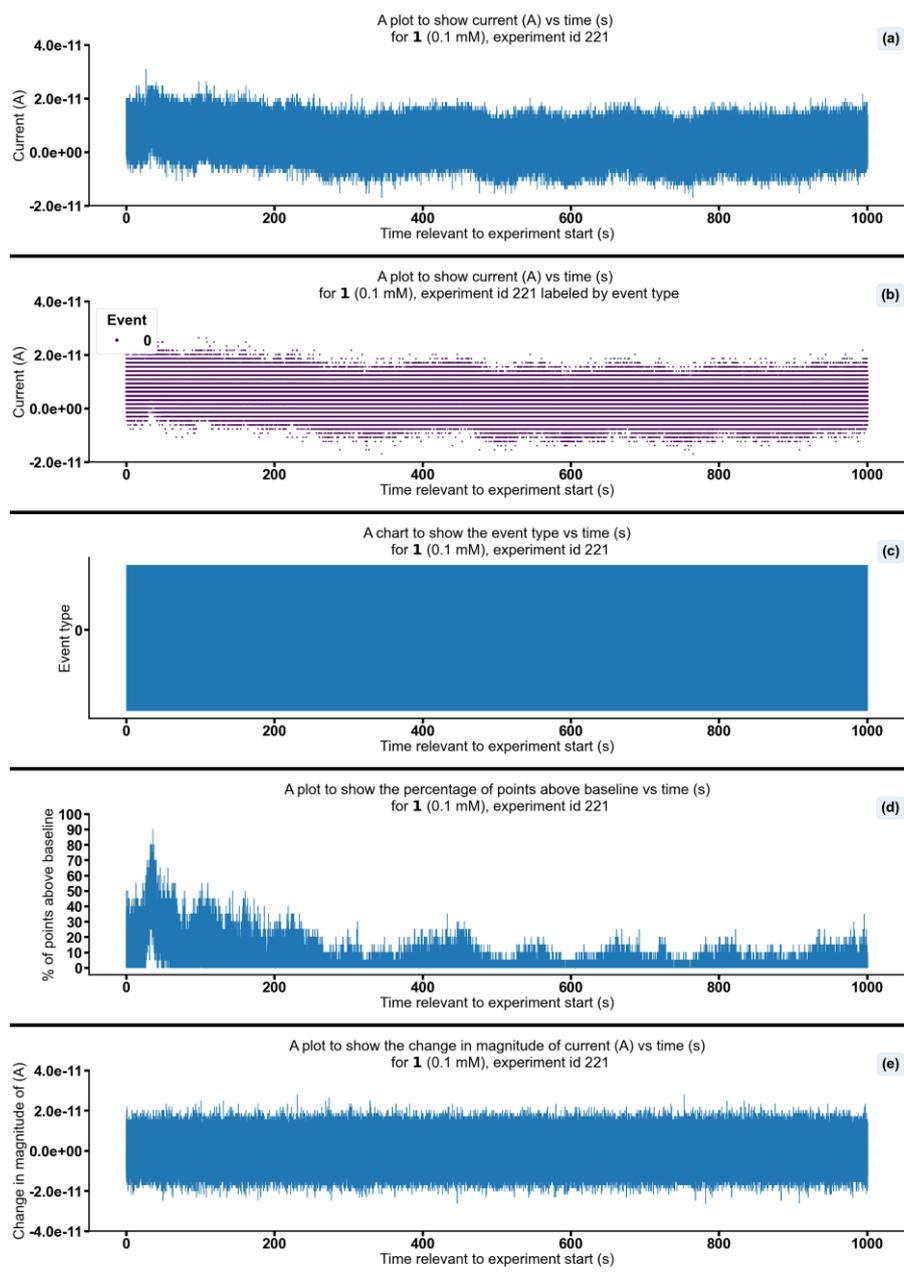

Figure S167 - Summarising the data from the patch clamp experiment for **1** (0.1 mM), experiment id 221 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $1.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

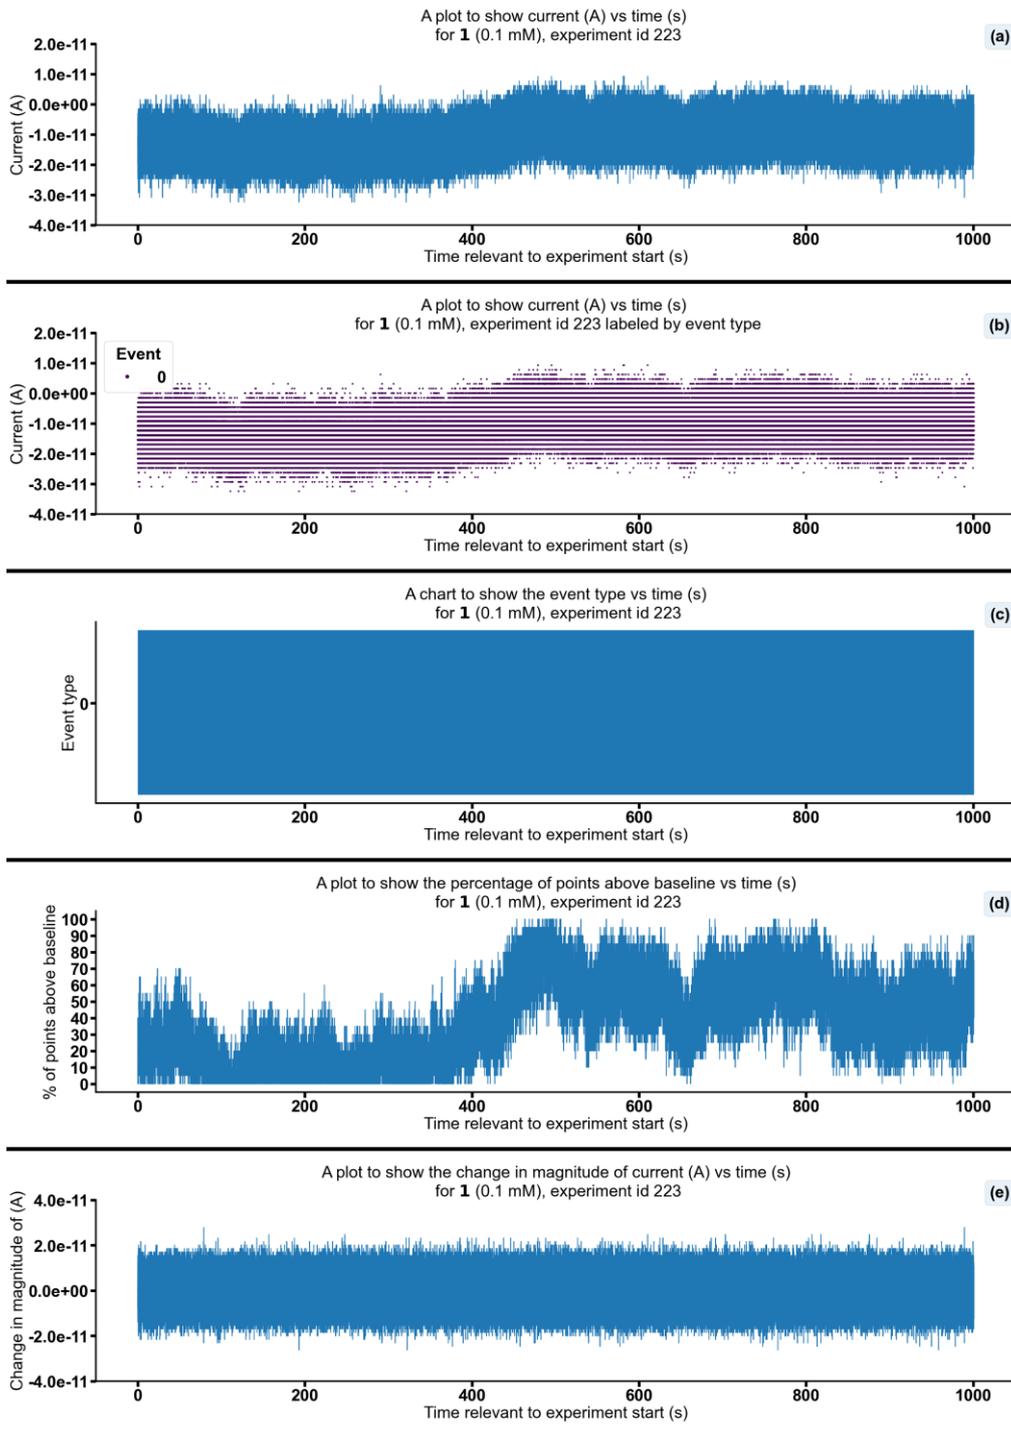

Figure S168 - Summarising the data from the patch clamp experiment for **1** (0.1 mM), experiment id 223 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event}$ $0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event}$ $1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event}$ $2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event}$ $3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.5 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

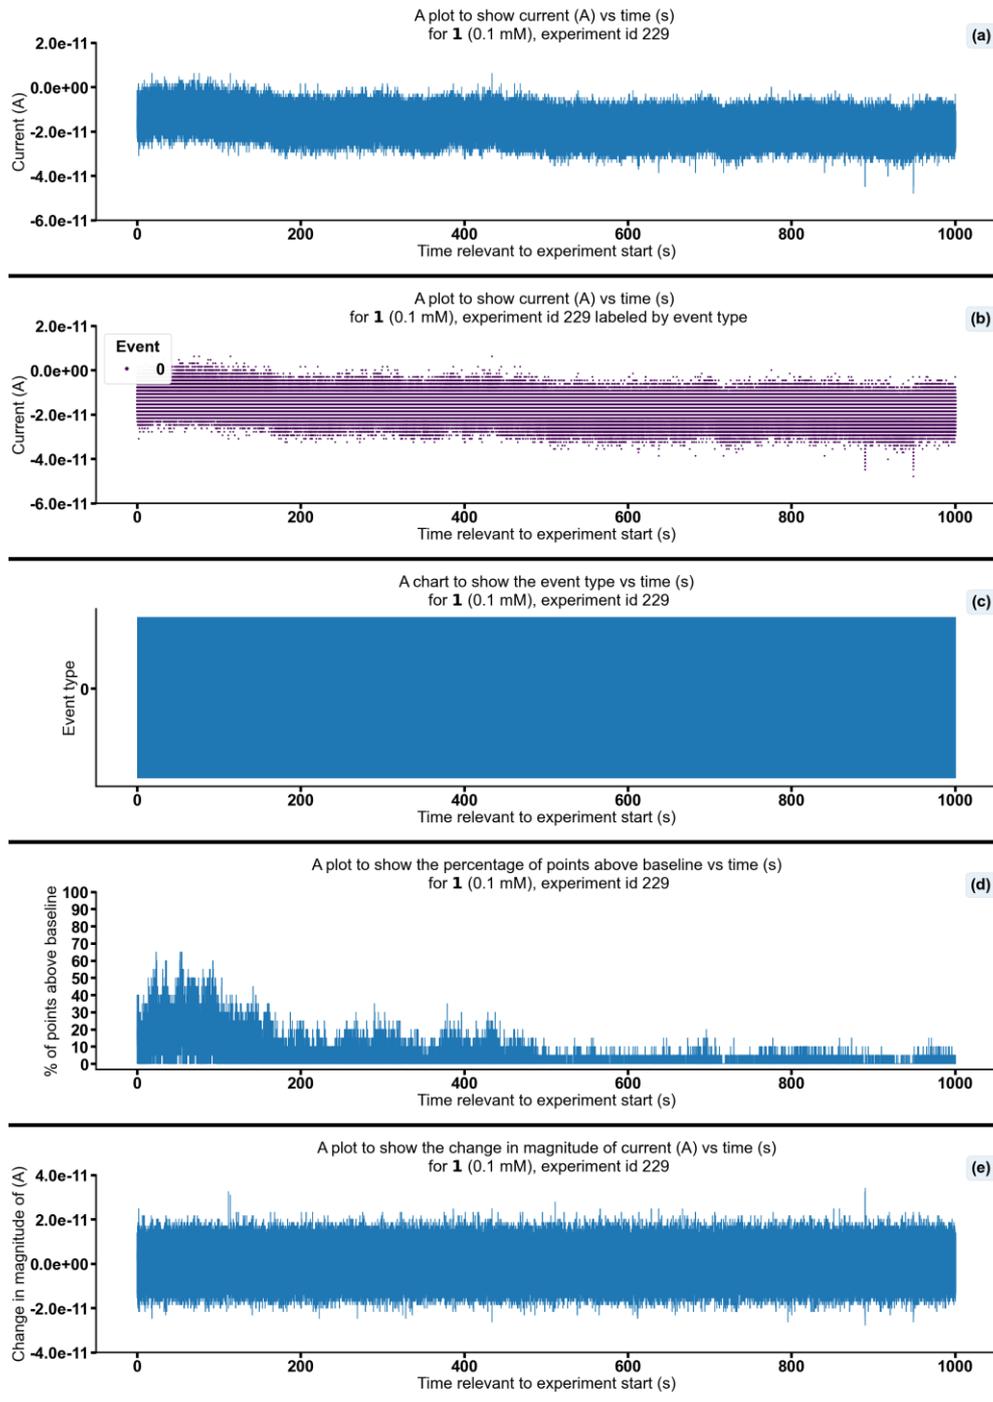

Figure S169 - Summarising the data from the patch clamp experiment for **1** (0.1 mM), experiment id 229 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-8.3 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

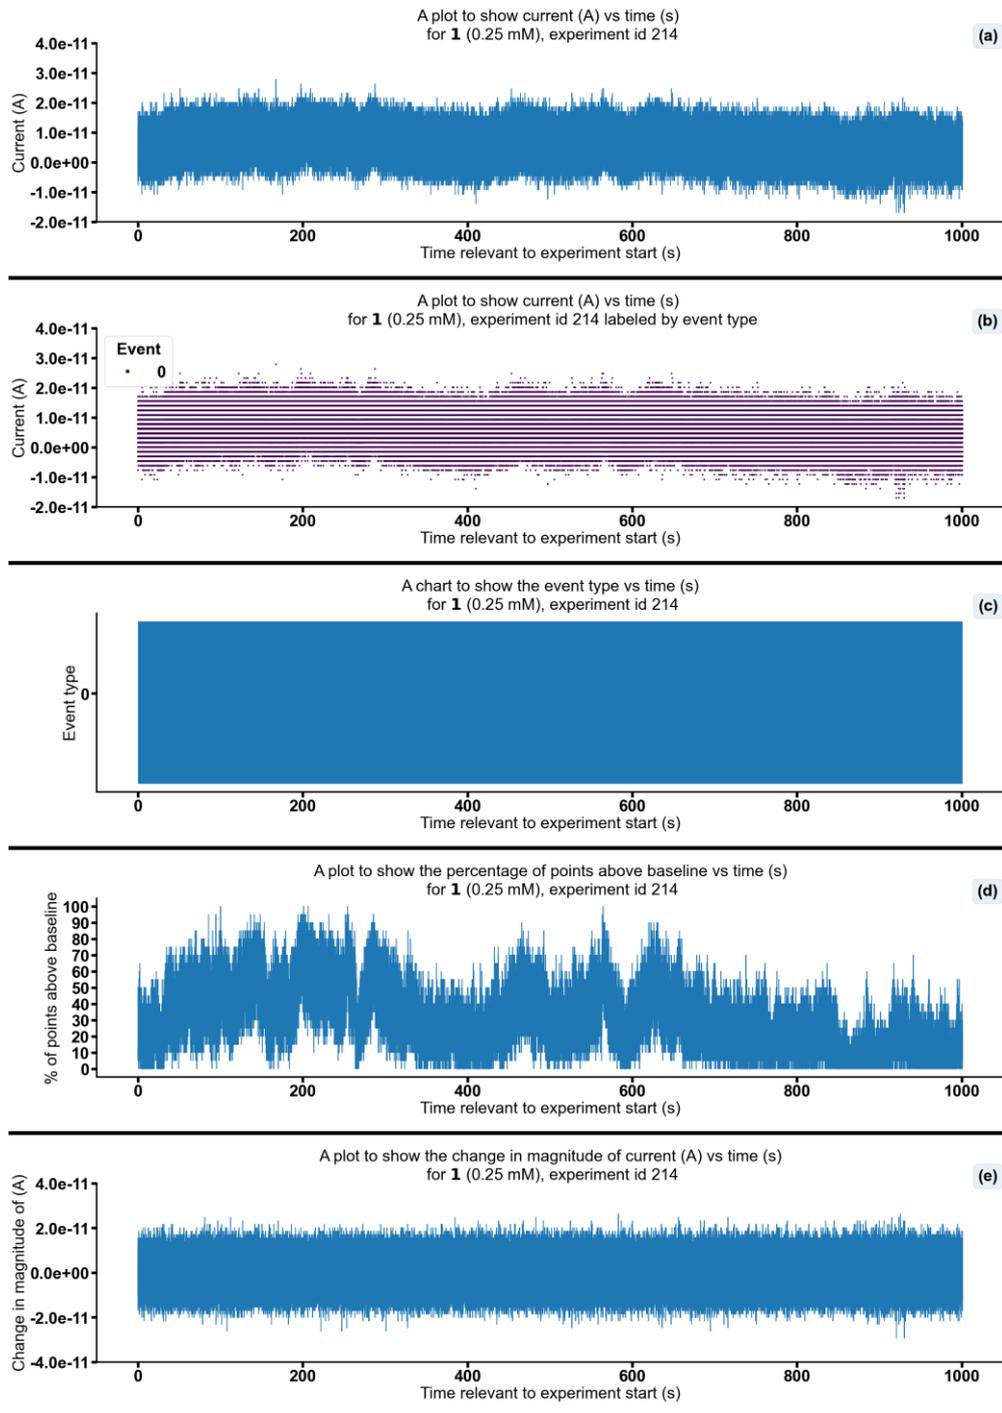

Figure S170 - Summarising the data from the patch clamp experiment for **1** (0.25 mM), experiment id 214 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $8.4 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

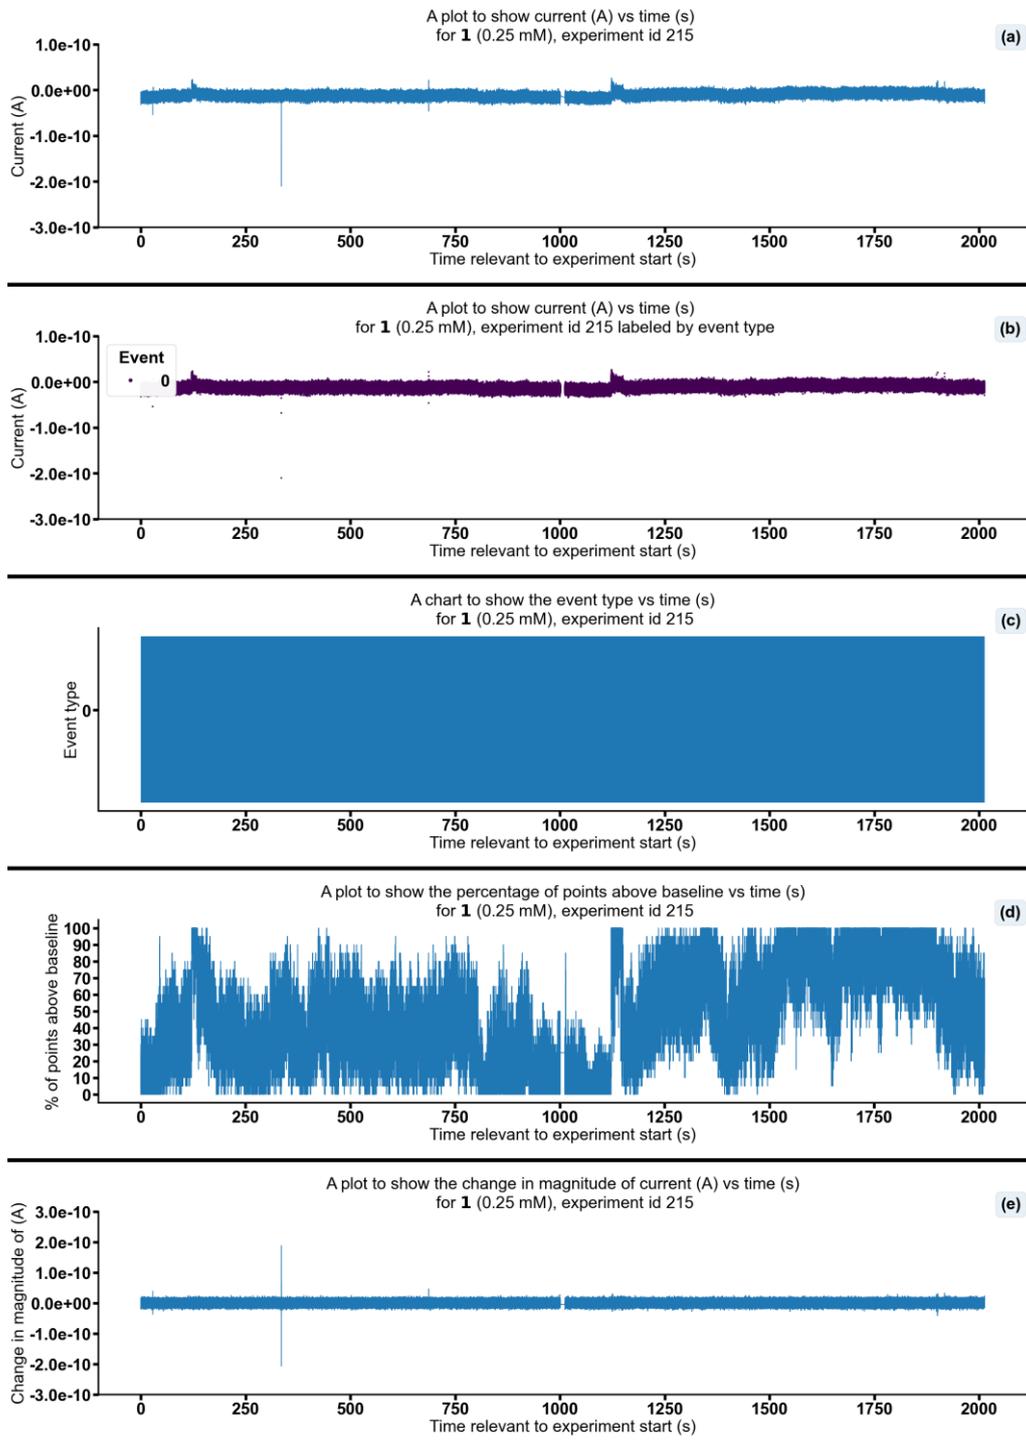

Figure S171 - Summarising the data from the patch clamp experiment for **1** (0.25 mM), experiment id 215 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

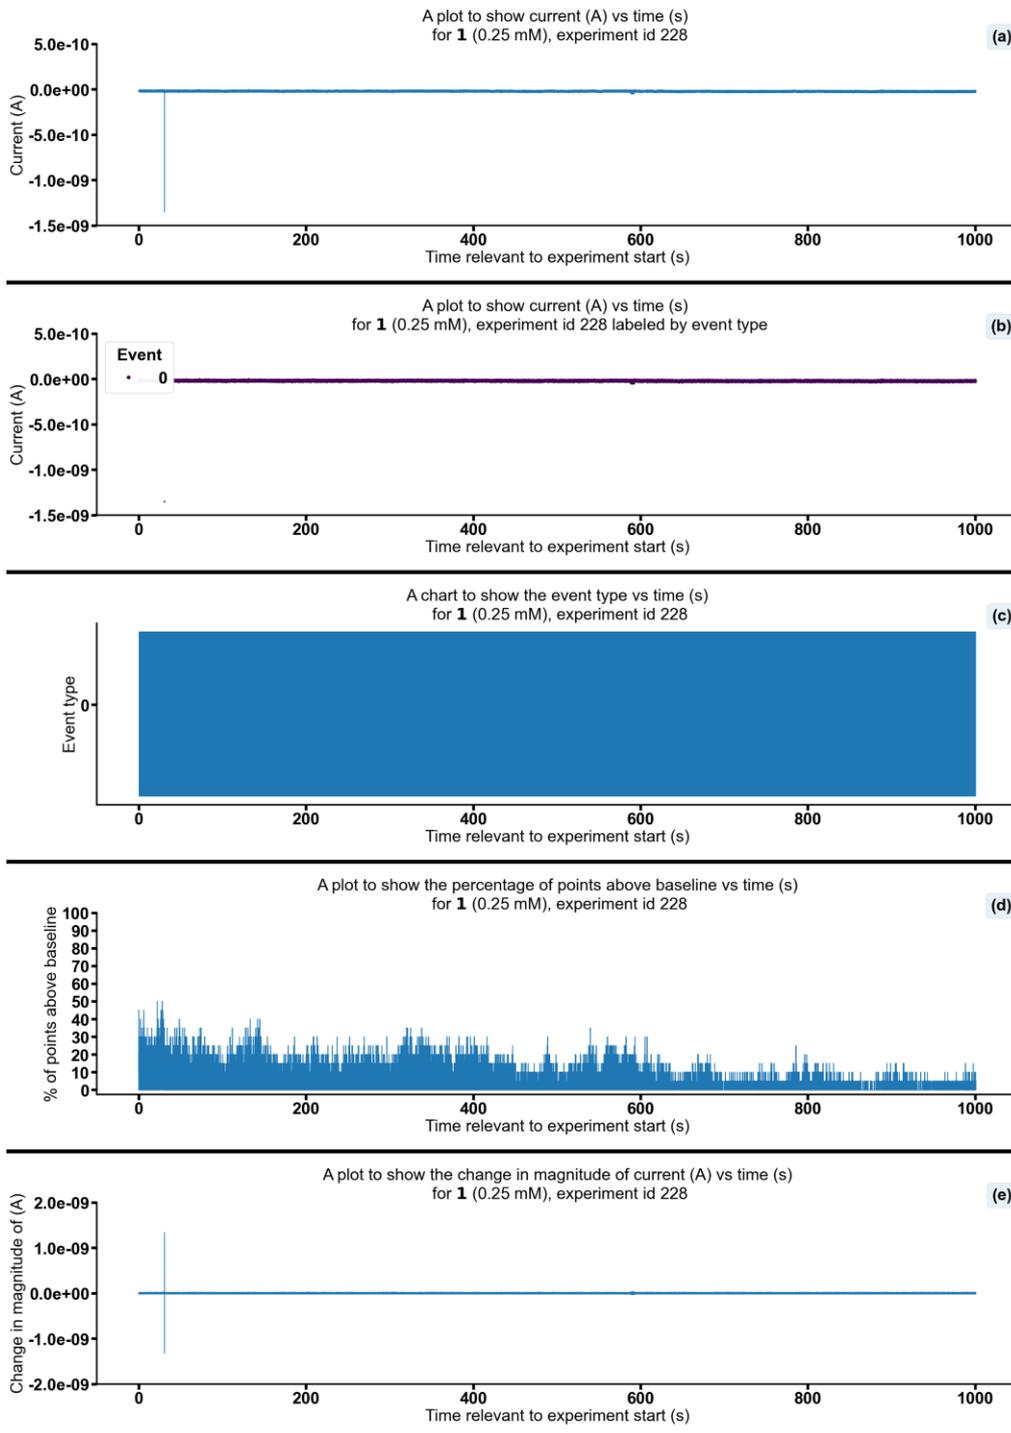

Figure S172 - Summarising the data from the patch clamp experiment for 1 (0.25 mM), experiment id 228 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. For (d), the percentage of points found above -1.5×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

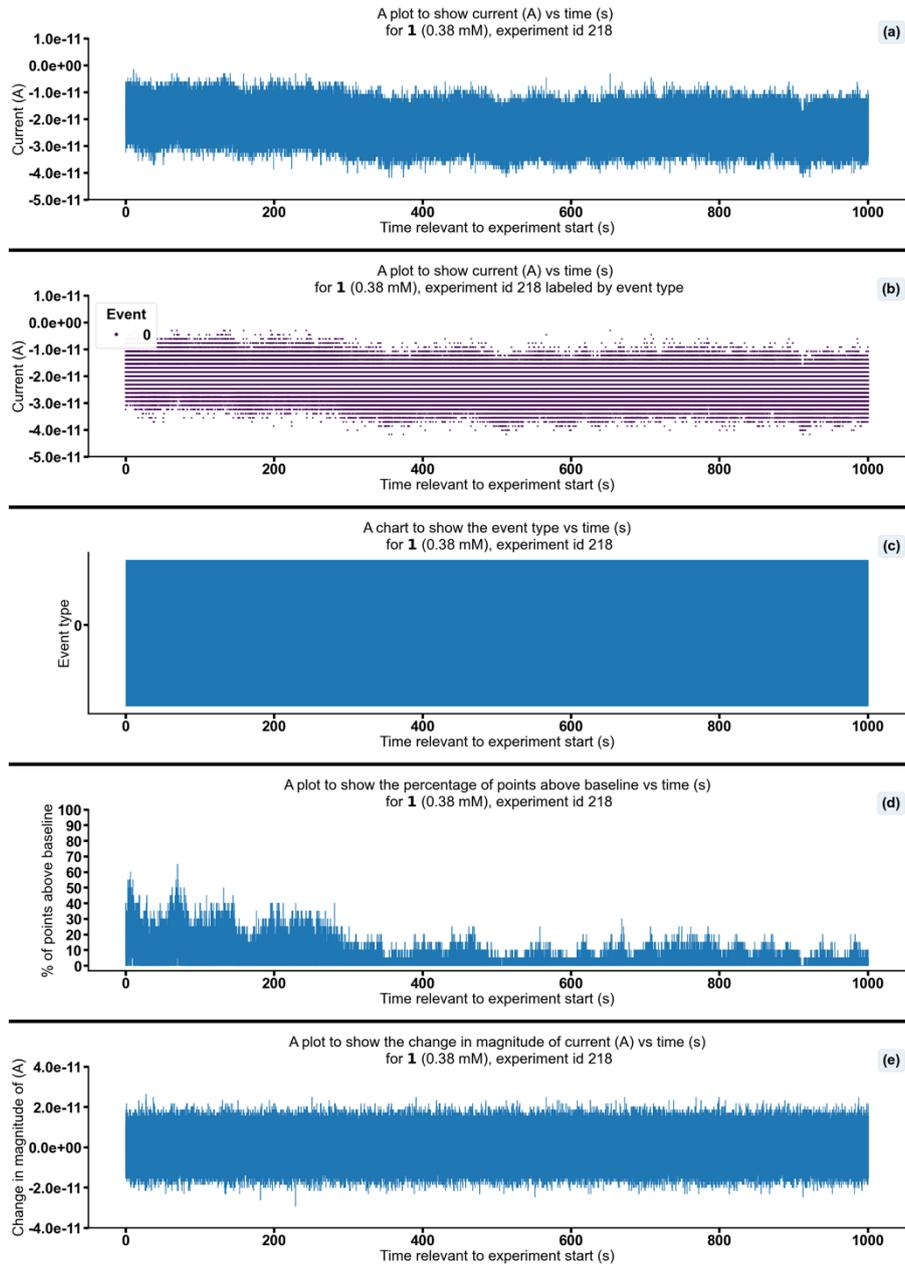

Figure S173 - Summarising the data from the patch clamp experiment for **1** (0.38 mM), experiment id 218 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.4 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

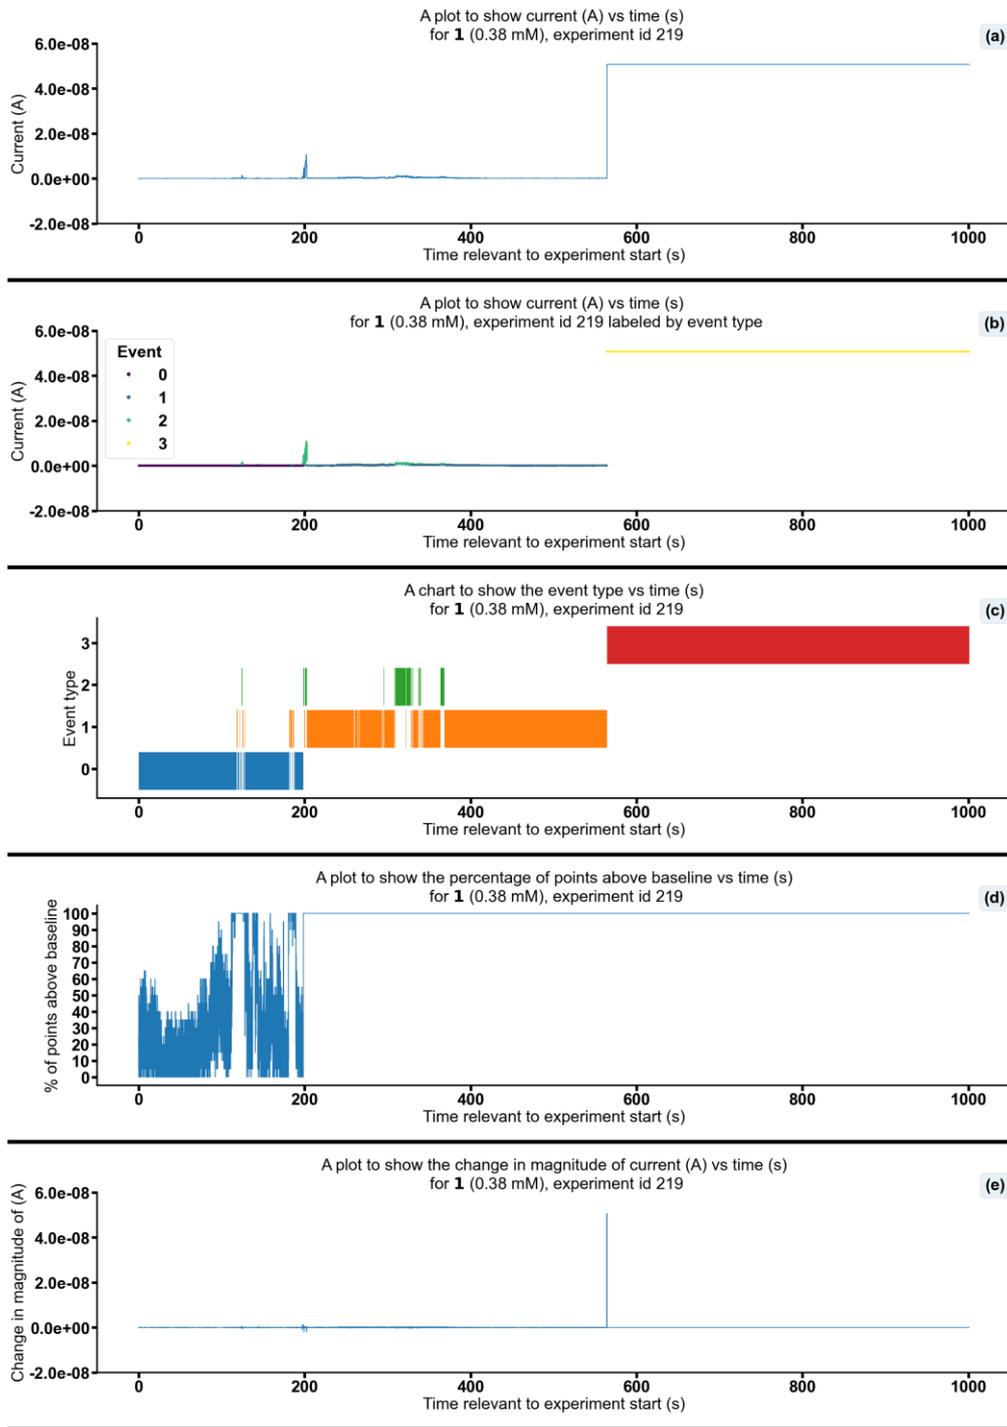

Figure S174 - Summarising the data from the patch clamp experiment for 1 (0.38 mM), experiment id 219 at +100 mV. Events were categorised into the following types: 0: $-\infty \leq \text{Event 0} < 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A $\leq \text{Event 1} < 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A $\leq \text{Event 2} < 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A $\leq \text{Event 3} < \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 1.1×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

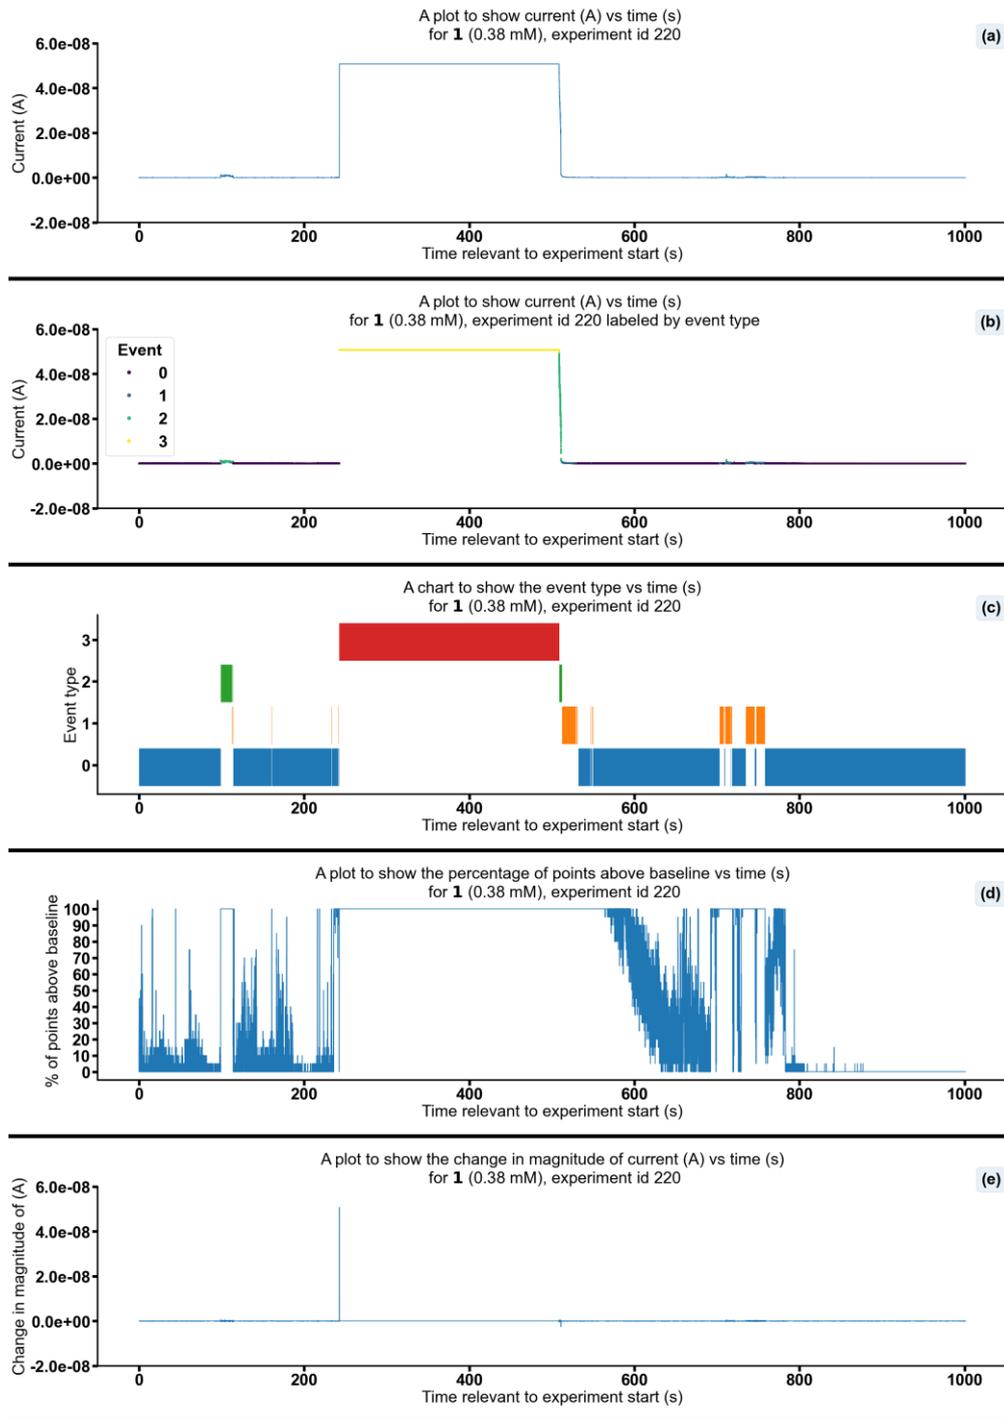

Figure S175 - Summarising the data from the patch clamp experiment for 1 (0.38 mM), experiment id 220 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.4 \times 10^{-13} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

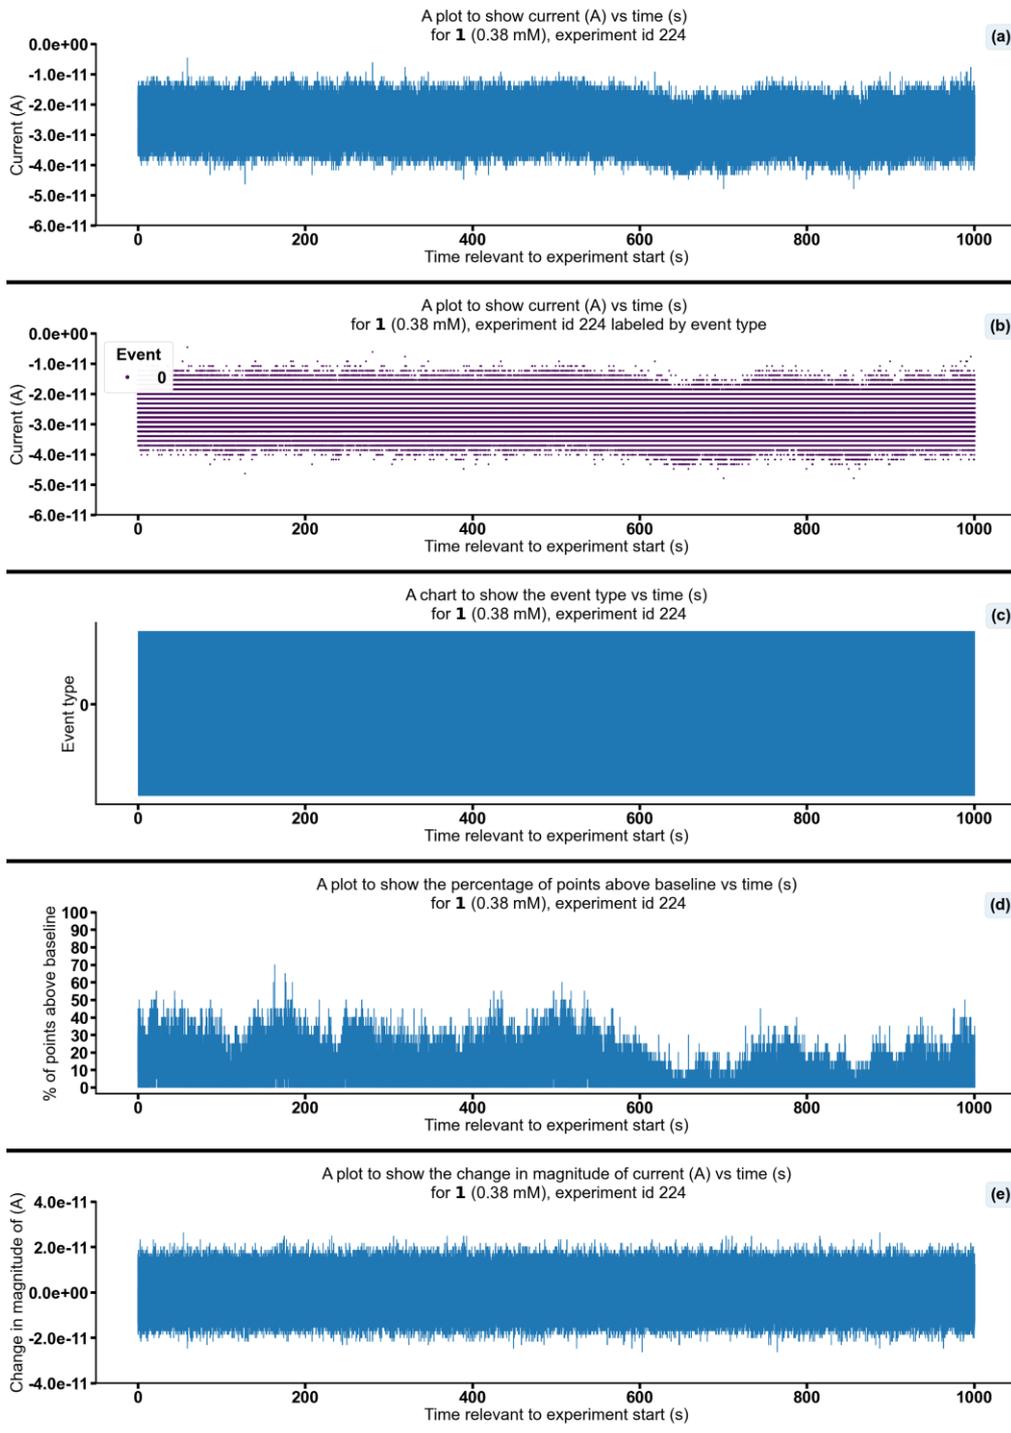

Figure S176 - Summarising the data from the patch clamp experiment for **1** (0.38 mM), experiment id 224 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event}$ 0 < $5.00e-11 \text{ A}$, 1: $5.00e-11 \text{ A} \leq \text{Event}$ 1 < $5.00e-10 \text{ A}$, 2: $5.00e-10 \text{ A} \leq \text{Event}$ 2 < $4.90e-08 \text{ A}$, 3: $4.90e-08 \text{ A} \leq \text{Event}$ 3 < $\infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.1e-11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

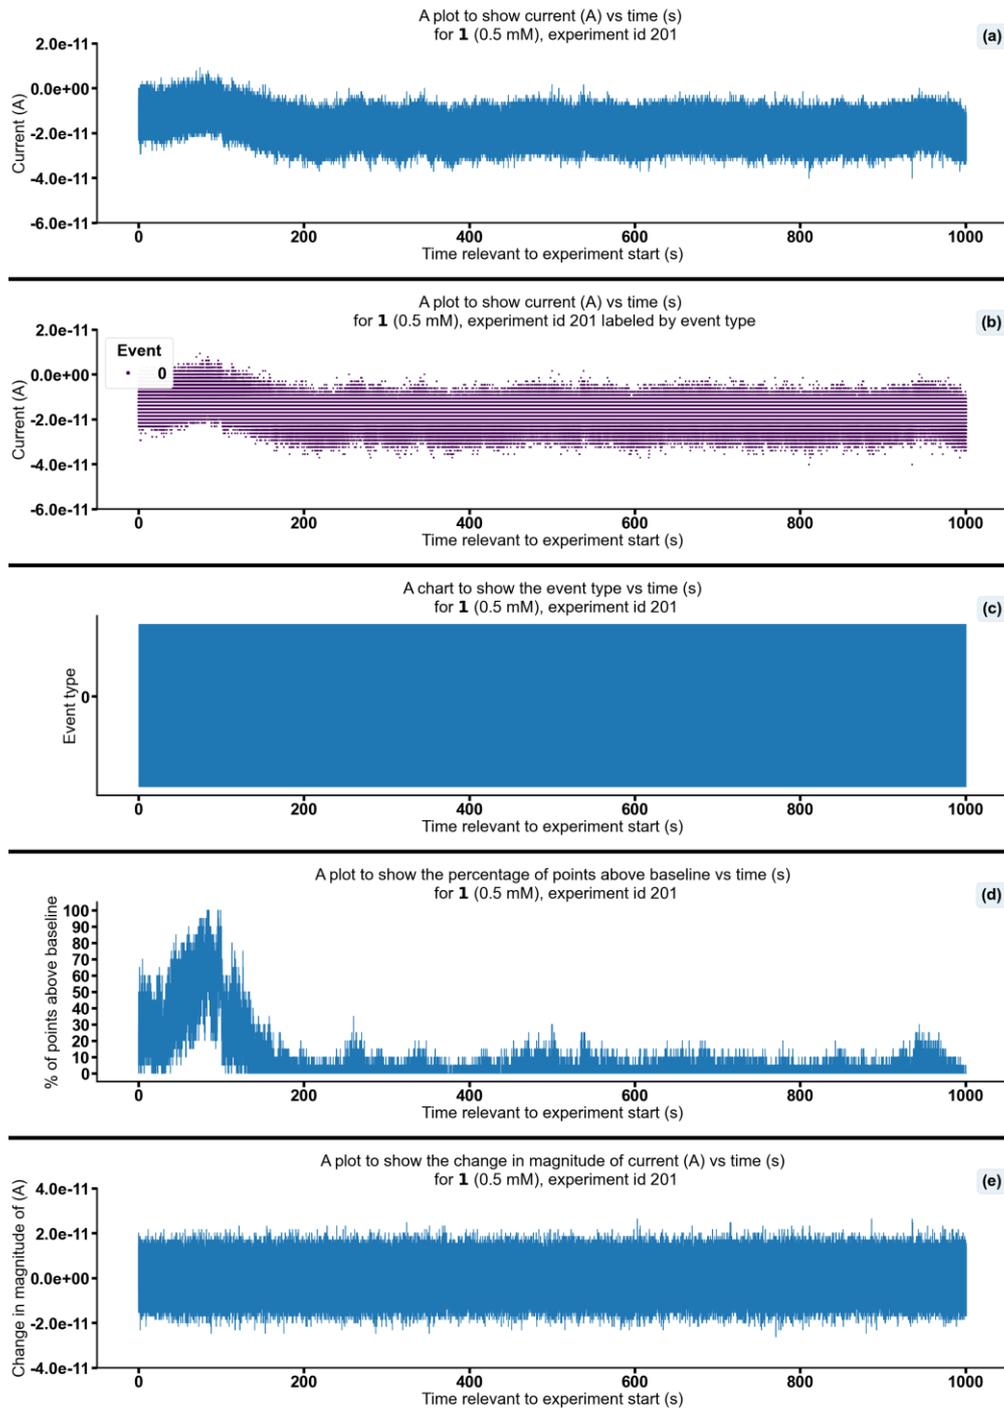

Figure S177 - Summarising the data from the patch clamp experiment for **1** (0.5 mM), experiment id 201 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.3 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

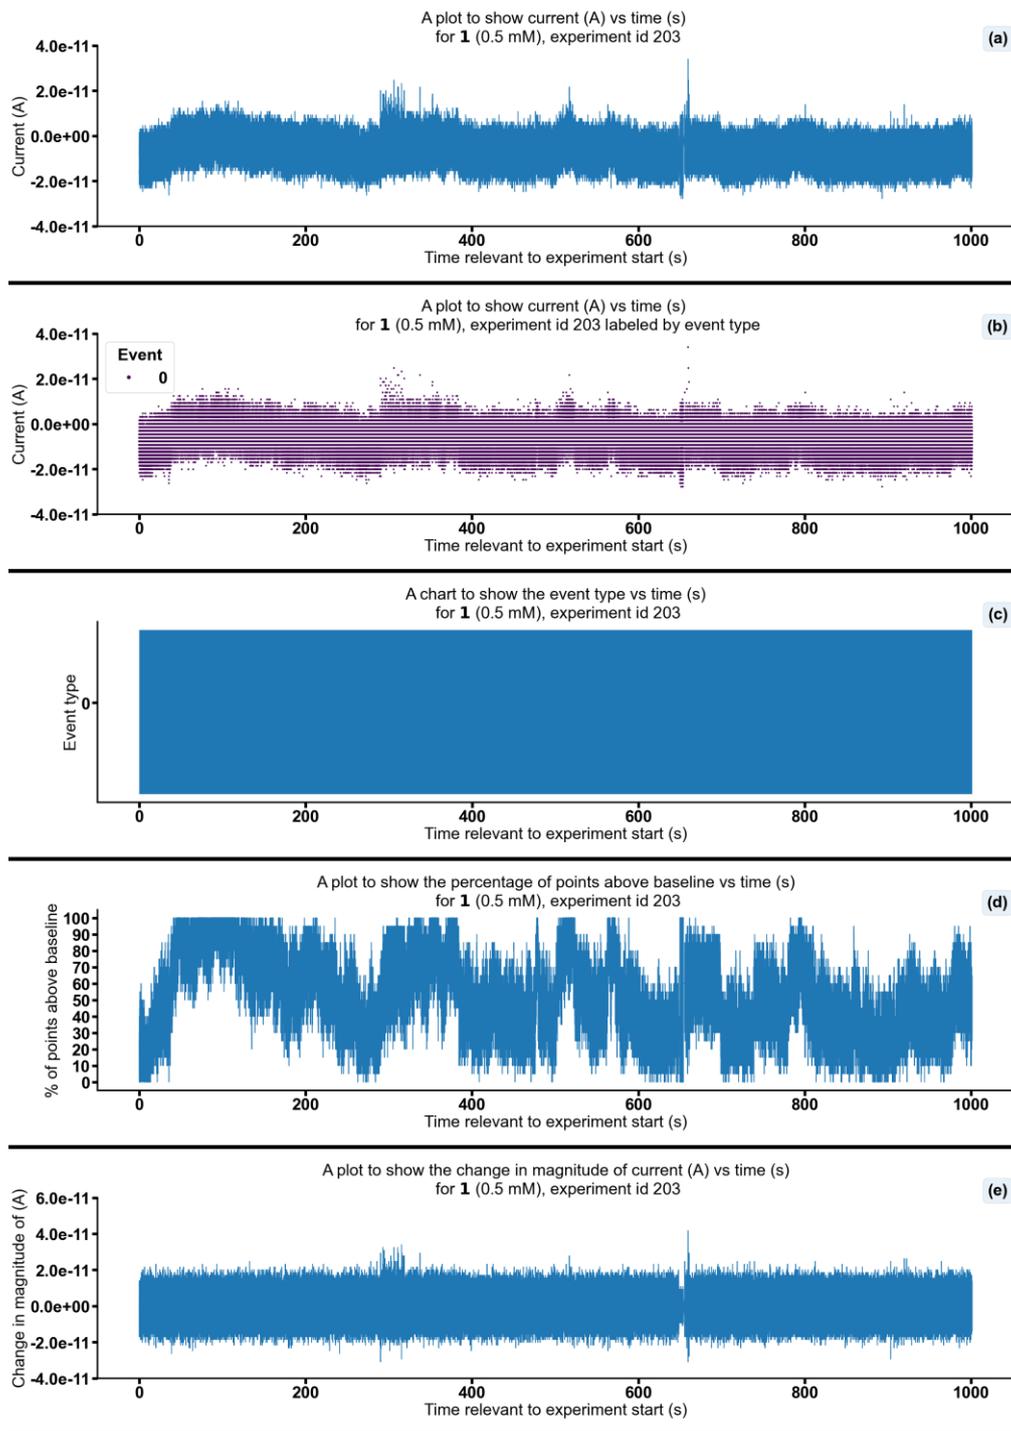

Figure S178 - Summarising the data from the patch clamp experiment for 1 (0.5 mM), experiment id 203 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. For (d), the percentage of points found above $-6.6 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

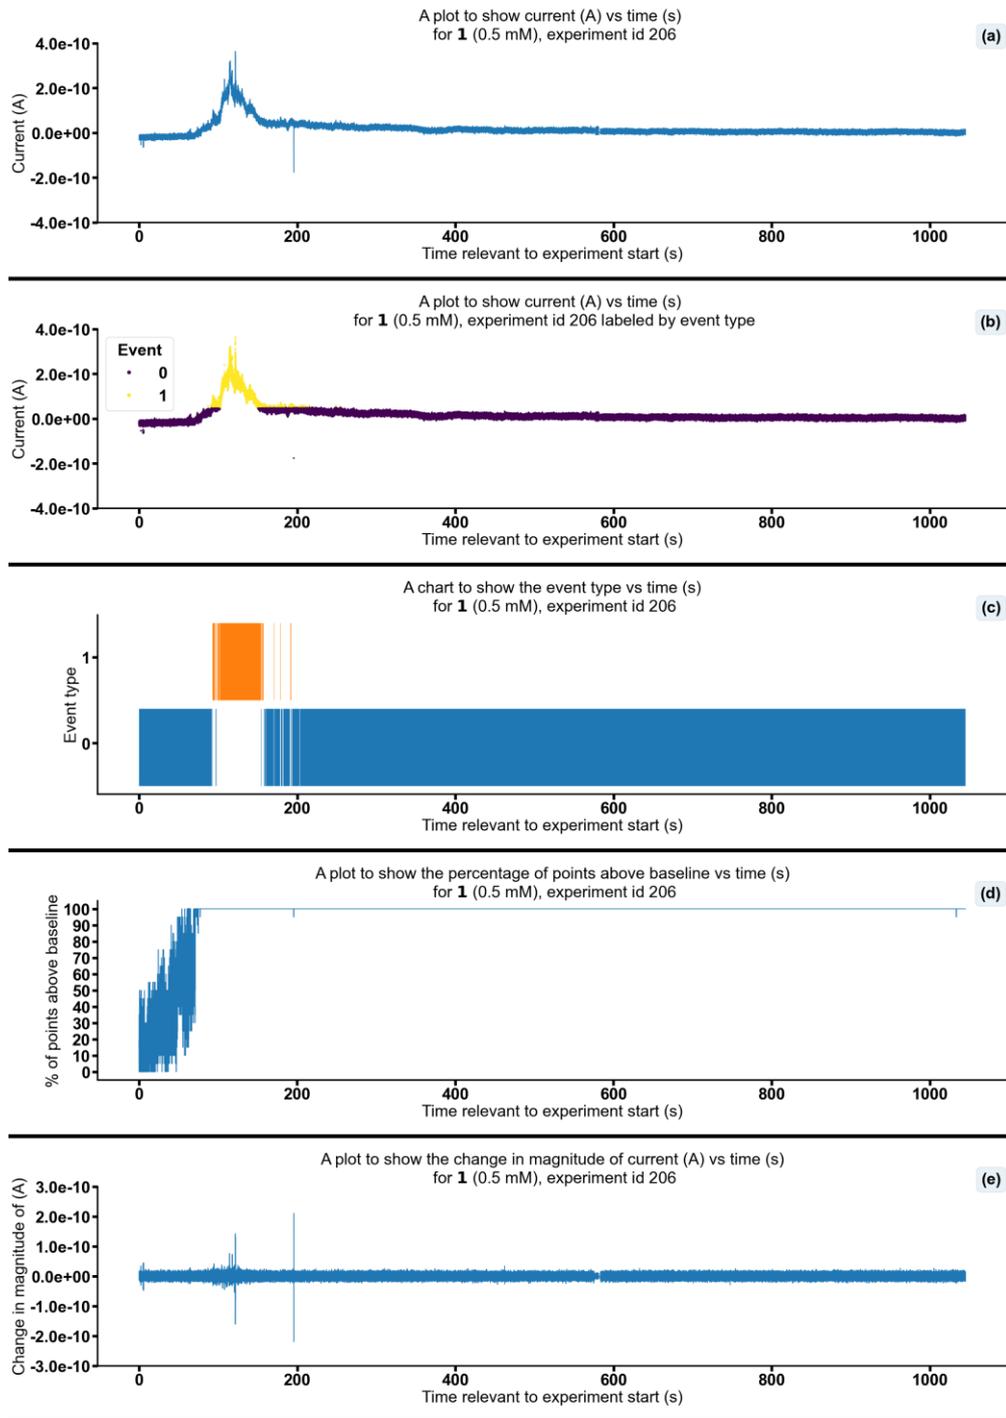

Figure S179 - Summarising the data from the patch clamp experiment for **1** (0.5 mM), experiment id 206 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.7 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

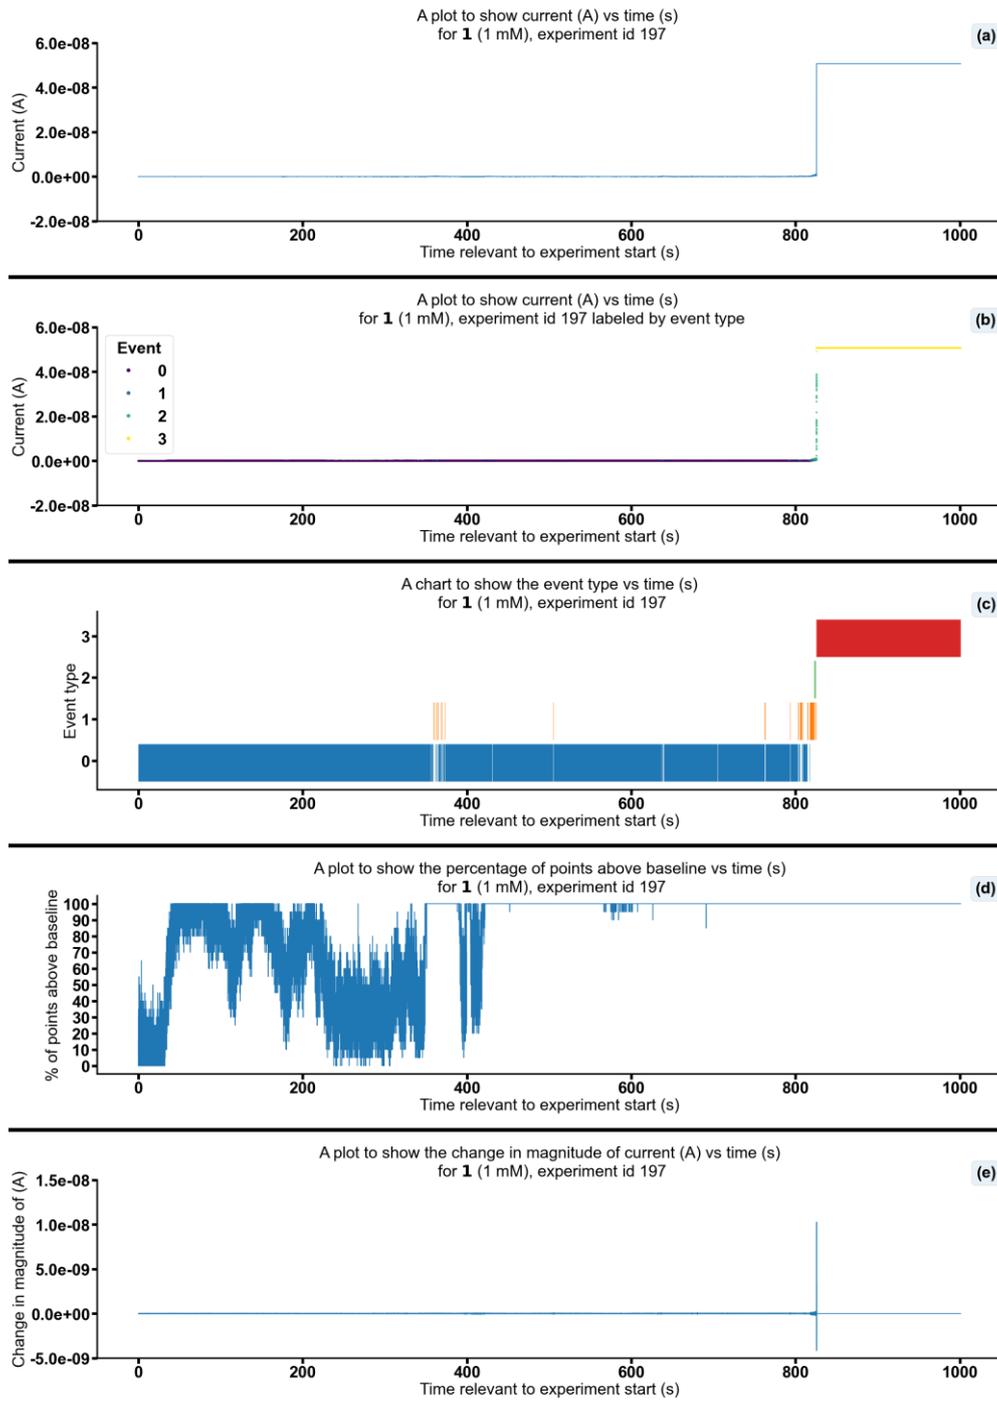

Figure S180 - Summarising the data from the patch clamp experiment for **1** (1 mM), experiment id 197 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.1 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

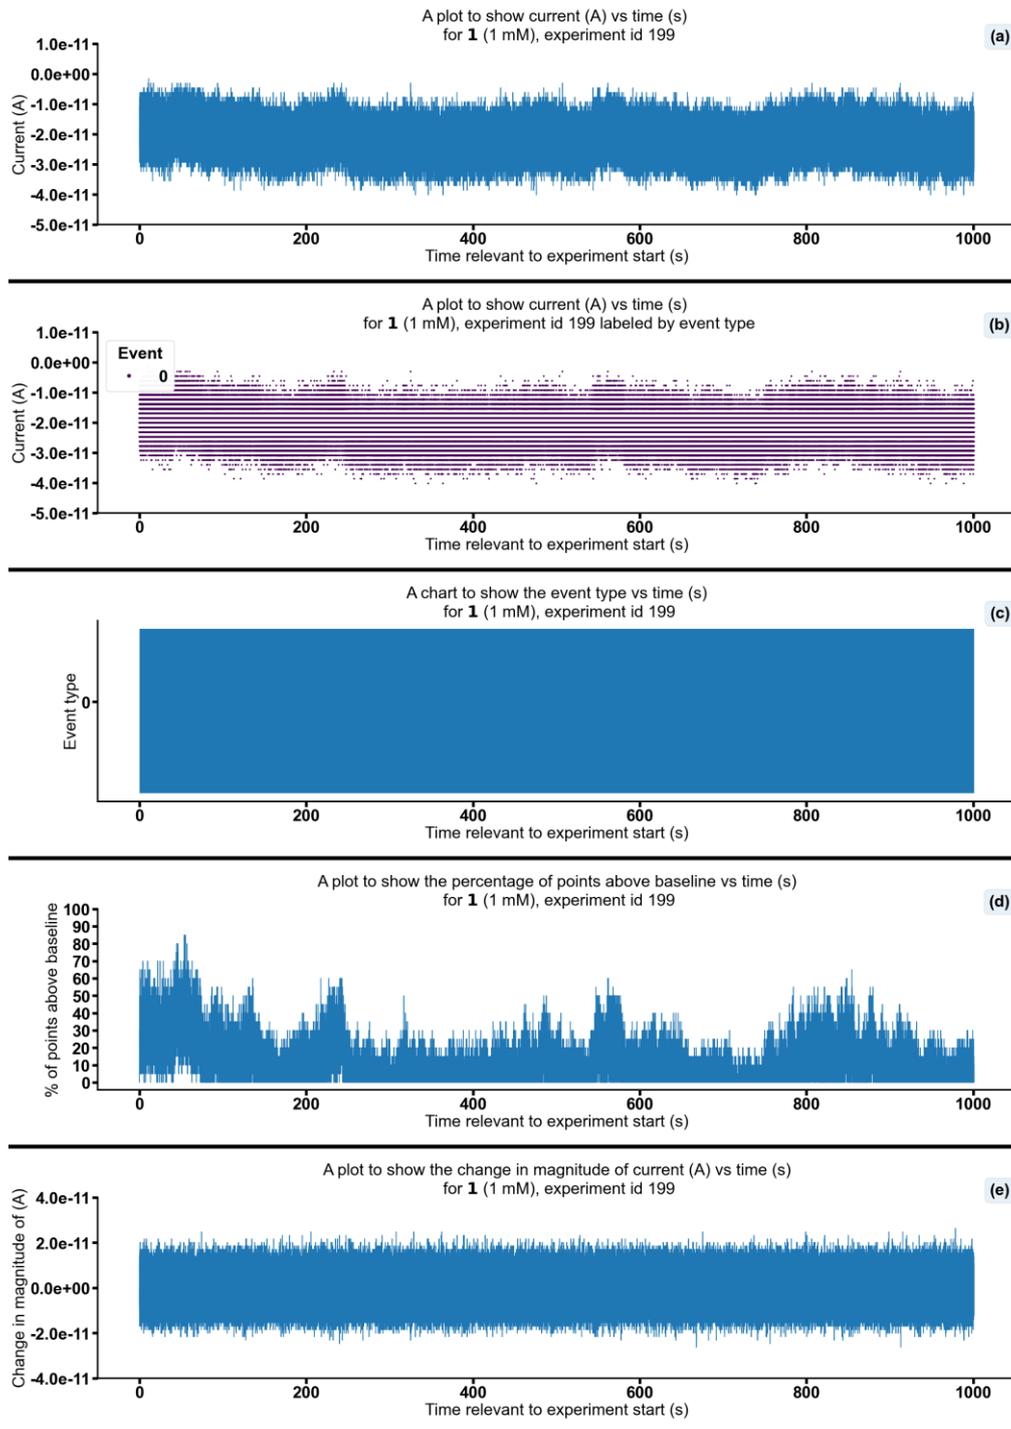

Figure S181 - Summarising the data from the patch clamp experiment for **1** (1 mM), experiment id 199 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.6 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

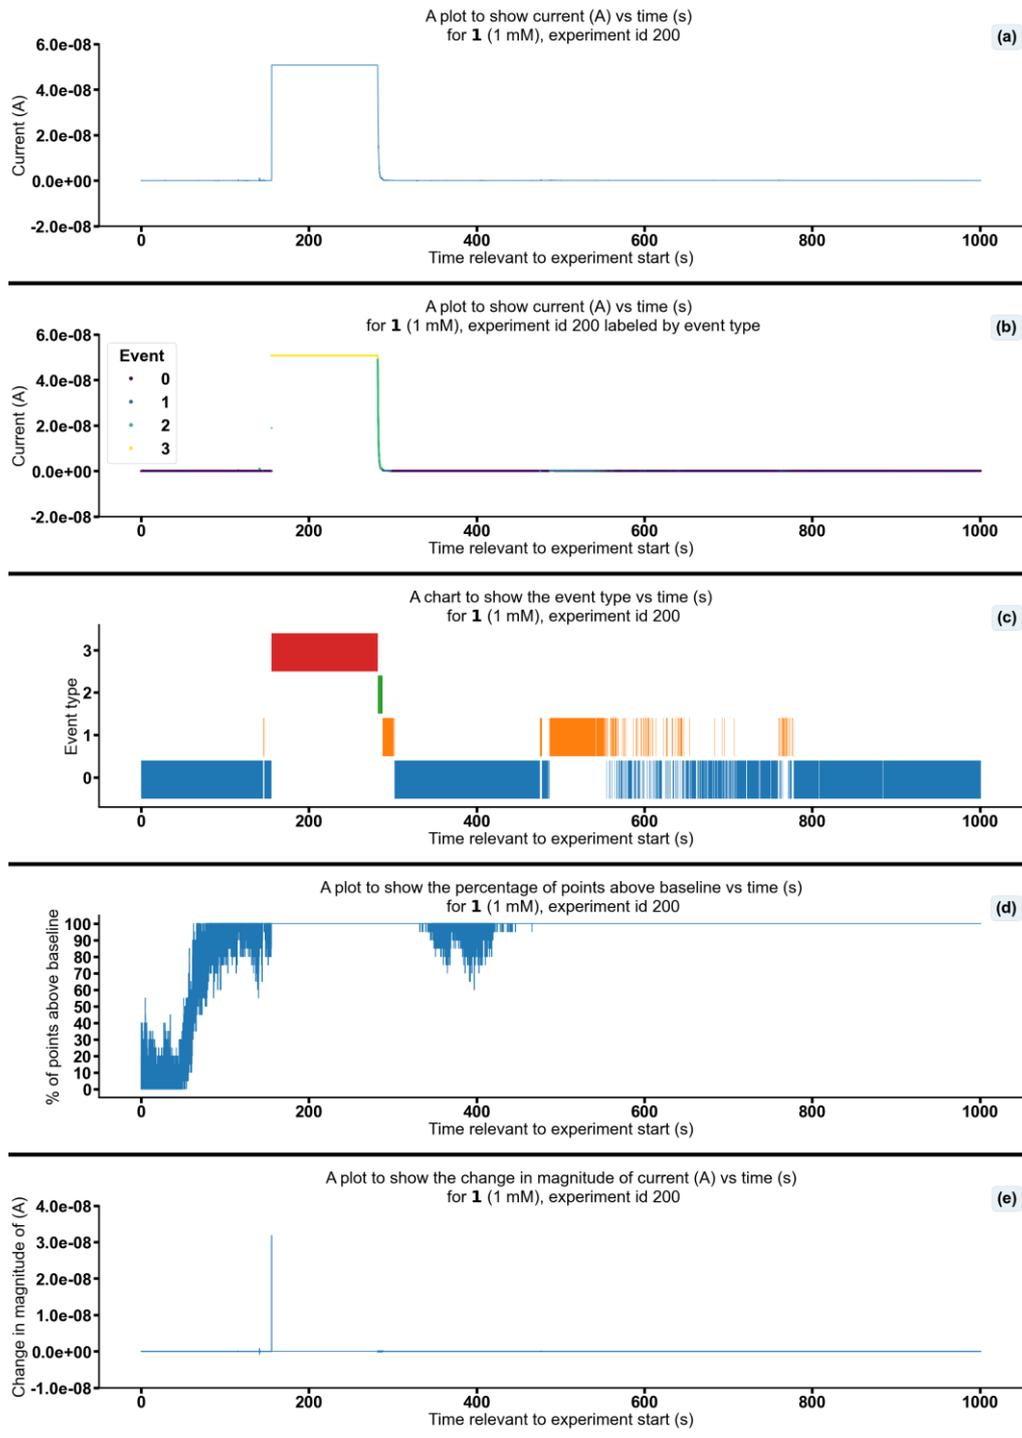

Figure S182 - Summarising the data from the patch clamp experiment for **1** (1 mM), experiment id 200 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$ Subfigure (d) shows the percentage of points found above the threshold $-4.4 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

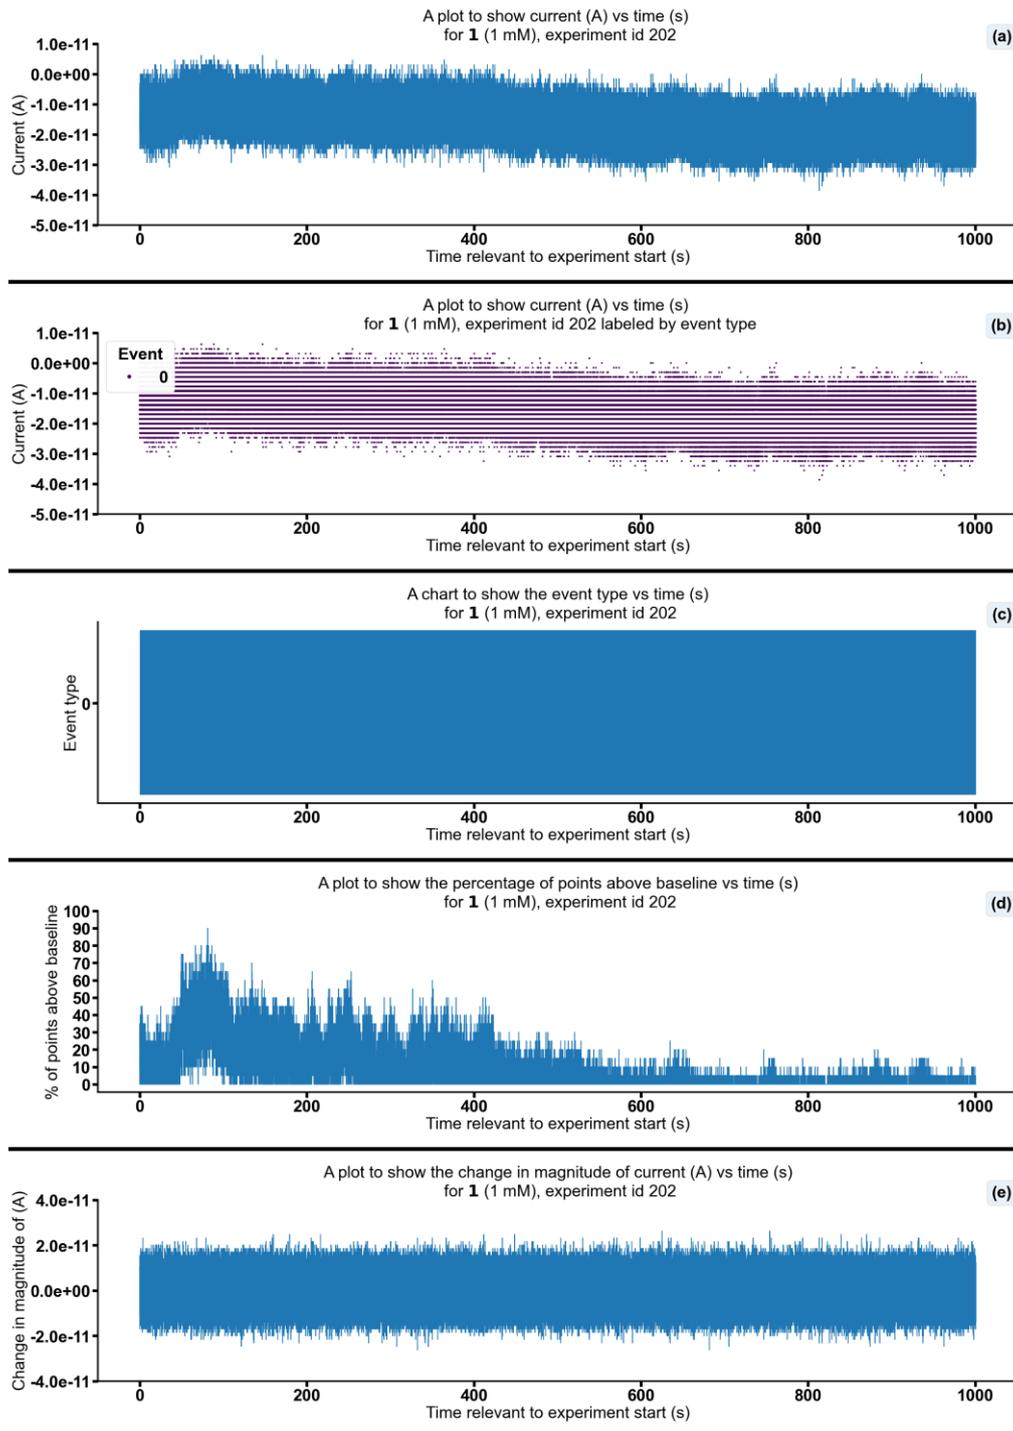

Figure S183 - Summarising the data from the patch clamp experiment for 1 (1 mM), experiment id 202 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.1 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

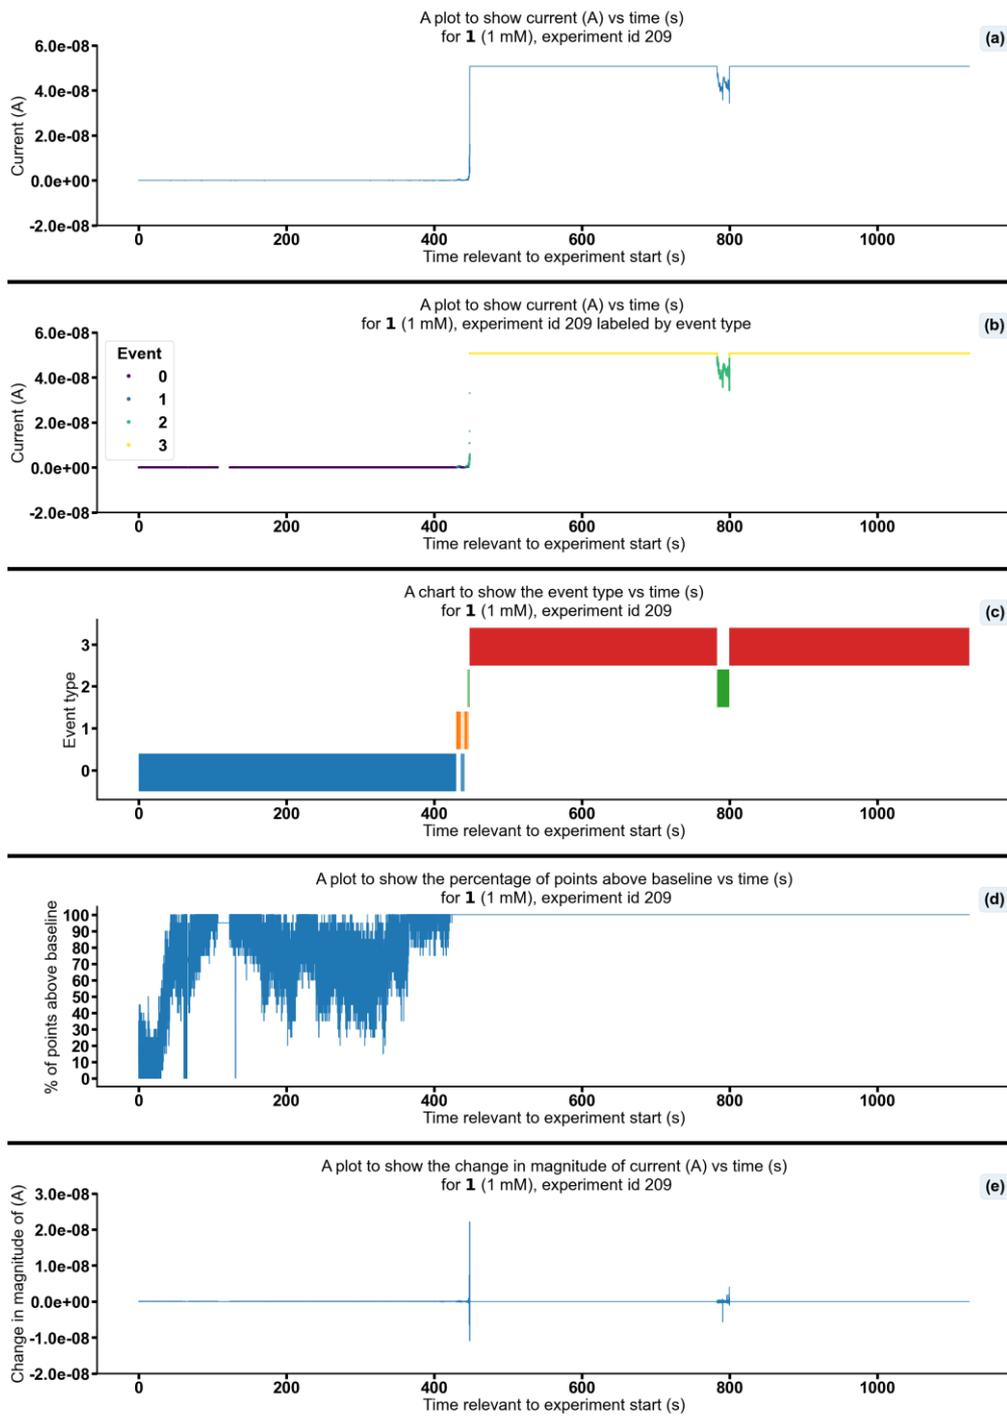

Figure S184 - Summarising the data from the patch clamp experiment for 1 (1 mM), experiment id 209 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-4.2 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

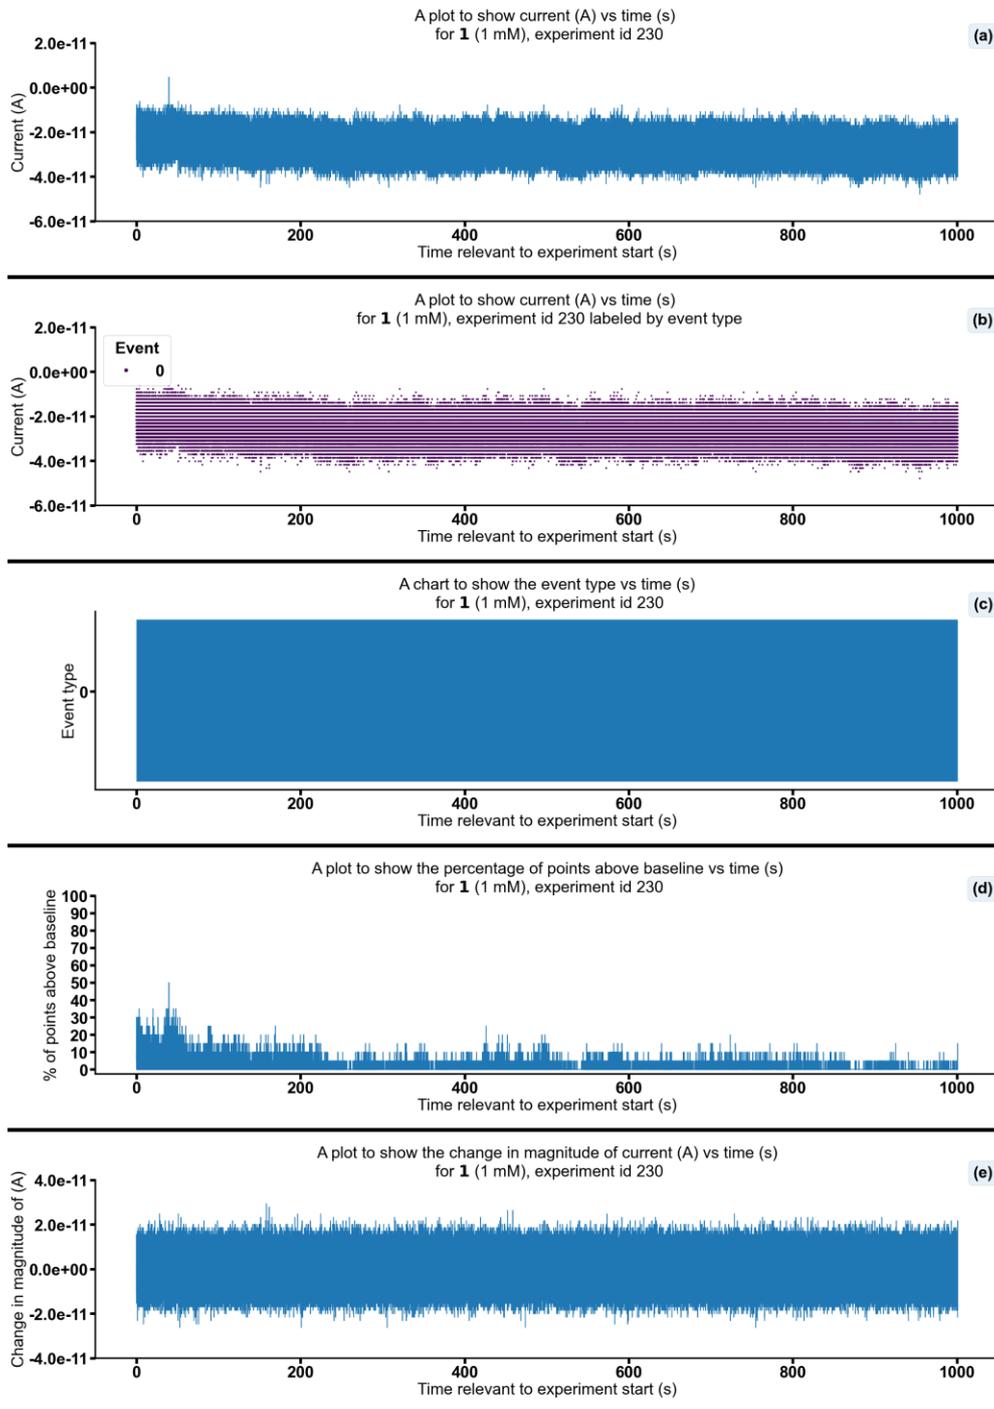

Figure S185 - Summarising the data from the patch clamp experiment for **1** (1 mM), experiment id 230 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.7 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

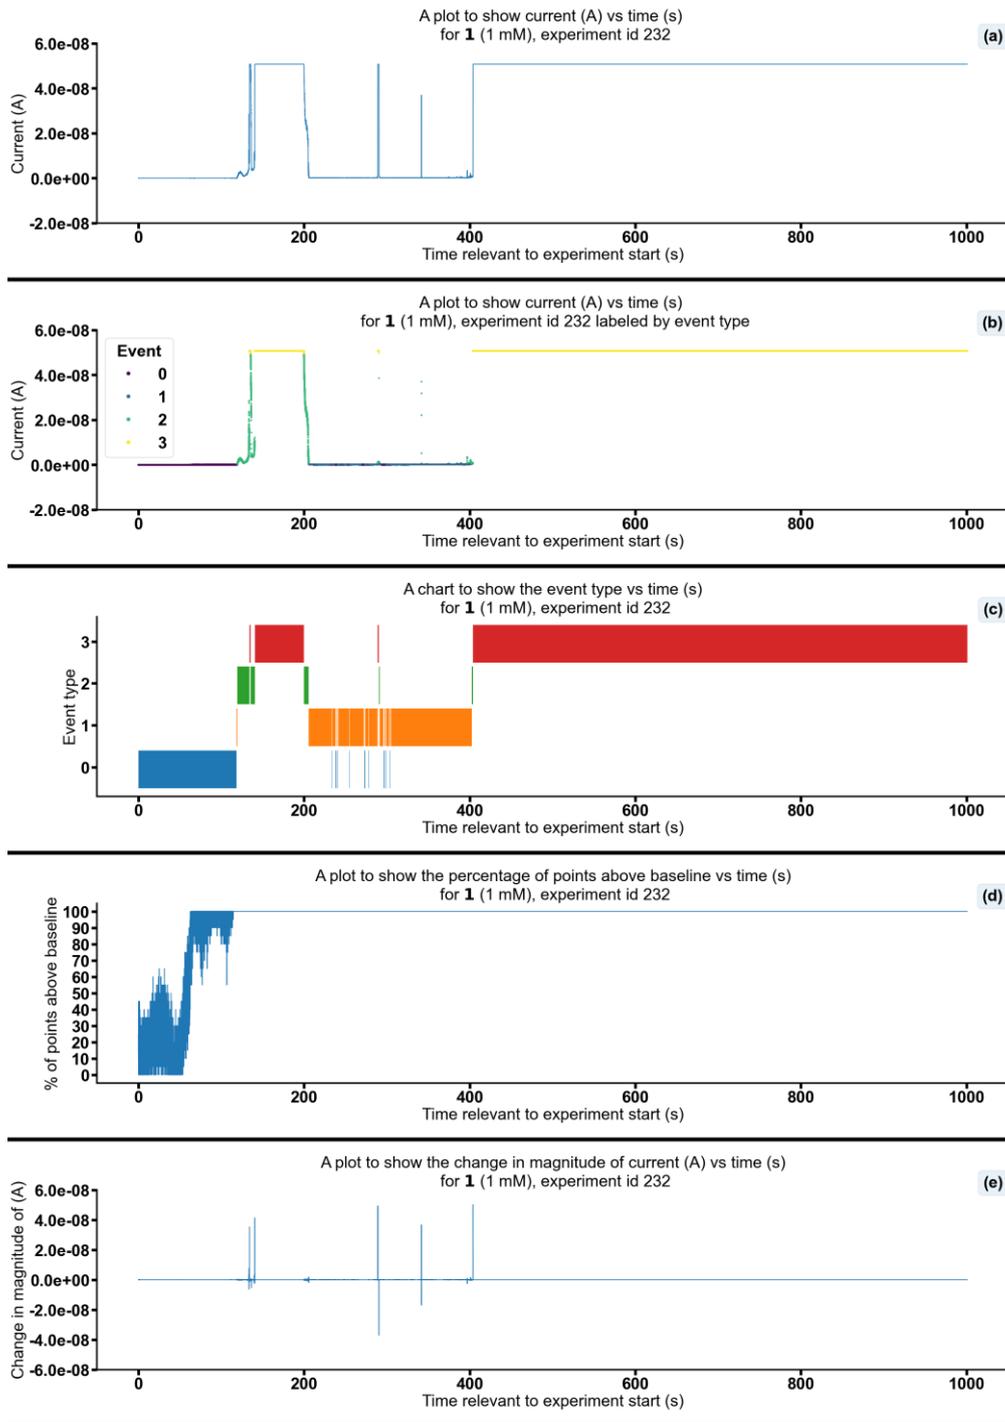

Figure S186 - Summarising the data from the patch clamp experiment for 1 (1 mM), experiment id 232 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.6 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing concentration of **3**

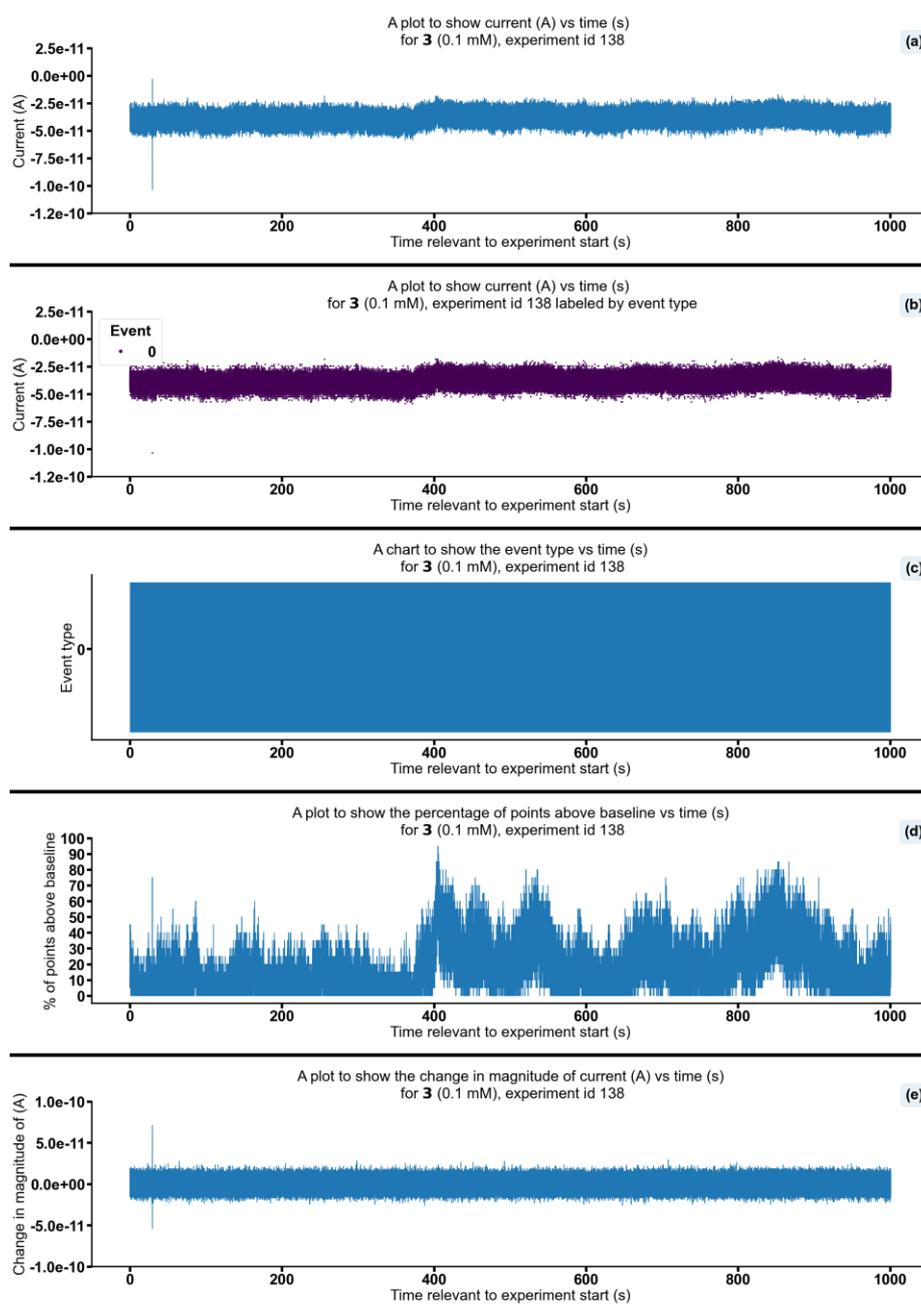

Figure S187 - Summarising the data from the patch clamp experiment for **3** (0.1 mM), experiment id 138 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold -3.5×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

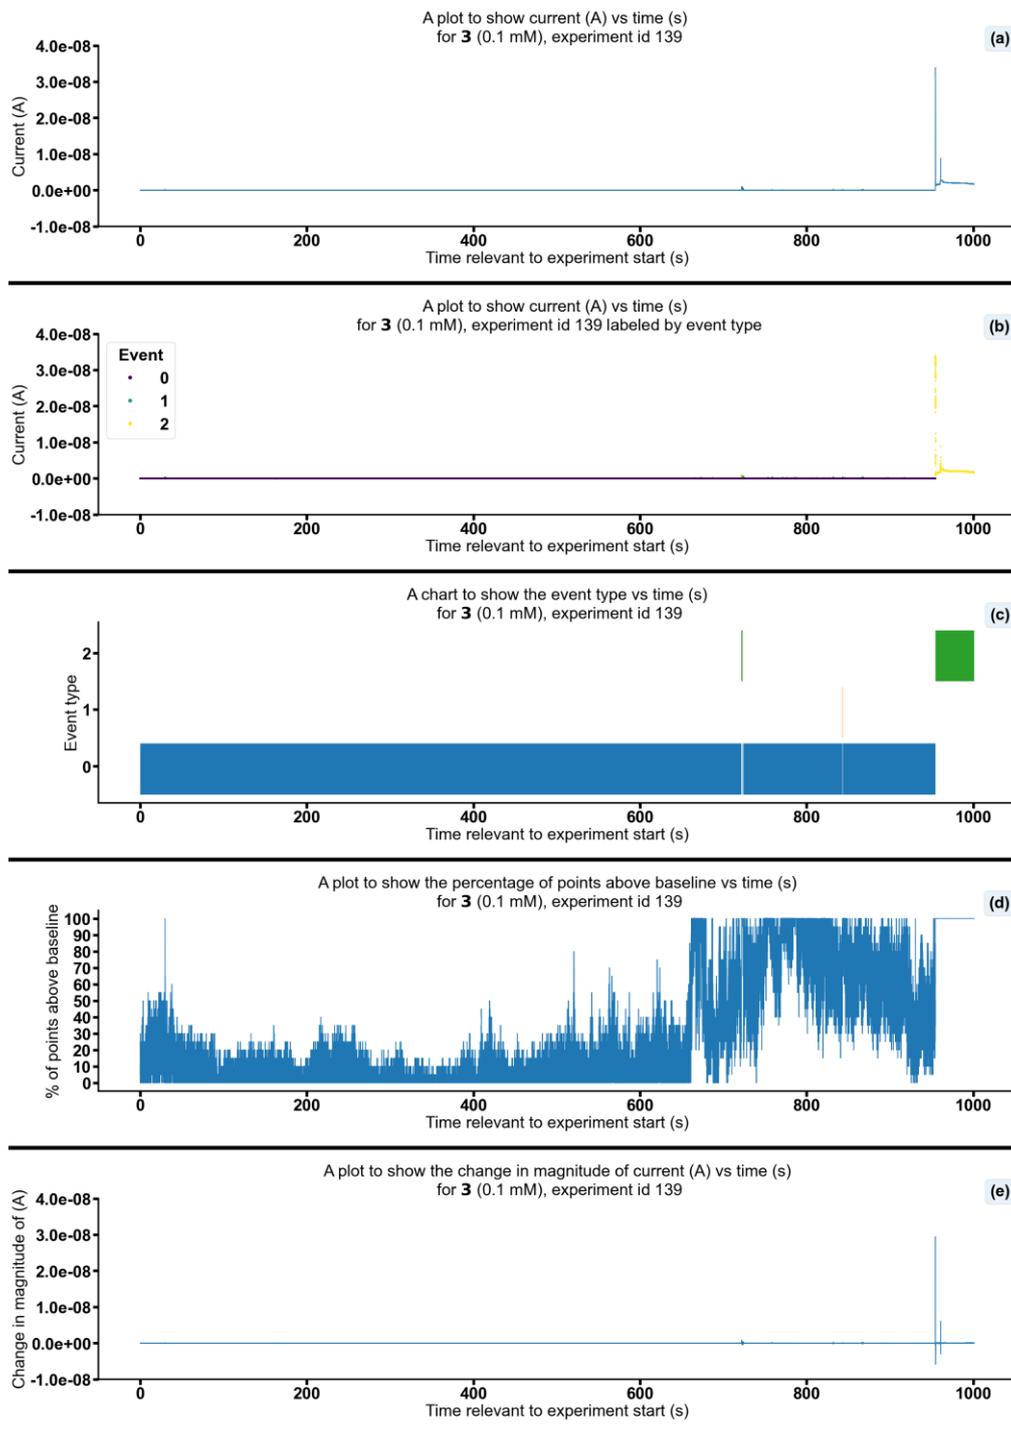

Figure S188 - Summarising the data from the patch clamp experiment for **3** (0.1 mM), experiment id 139 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

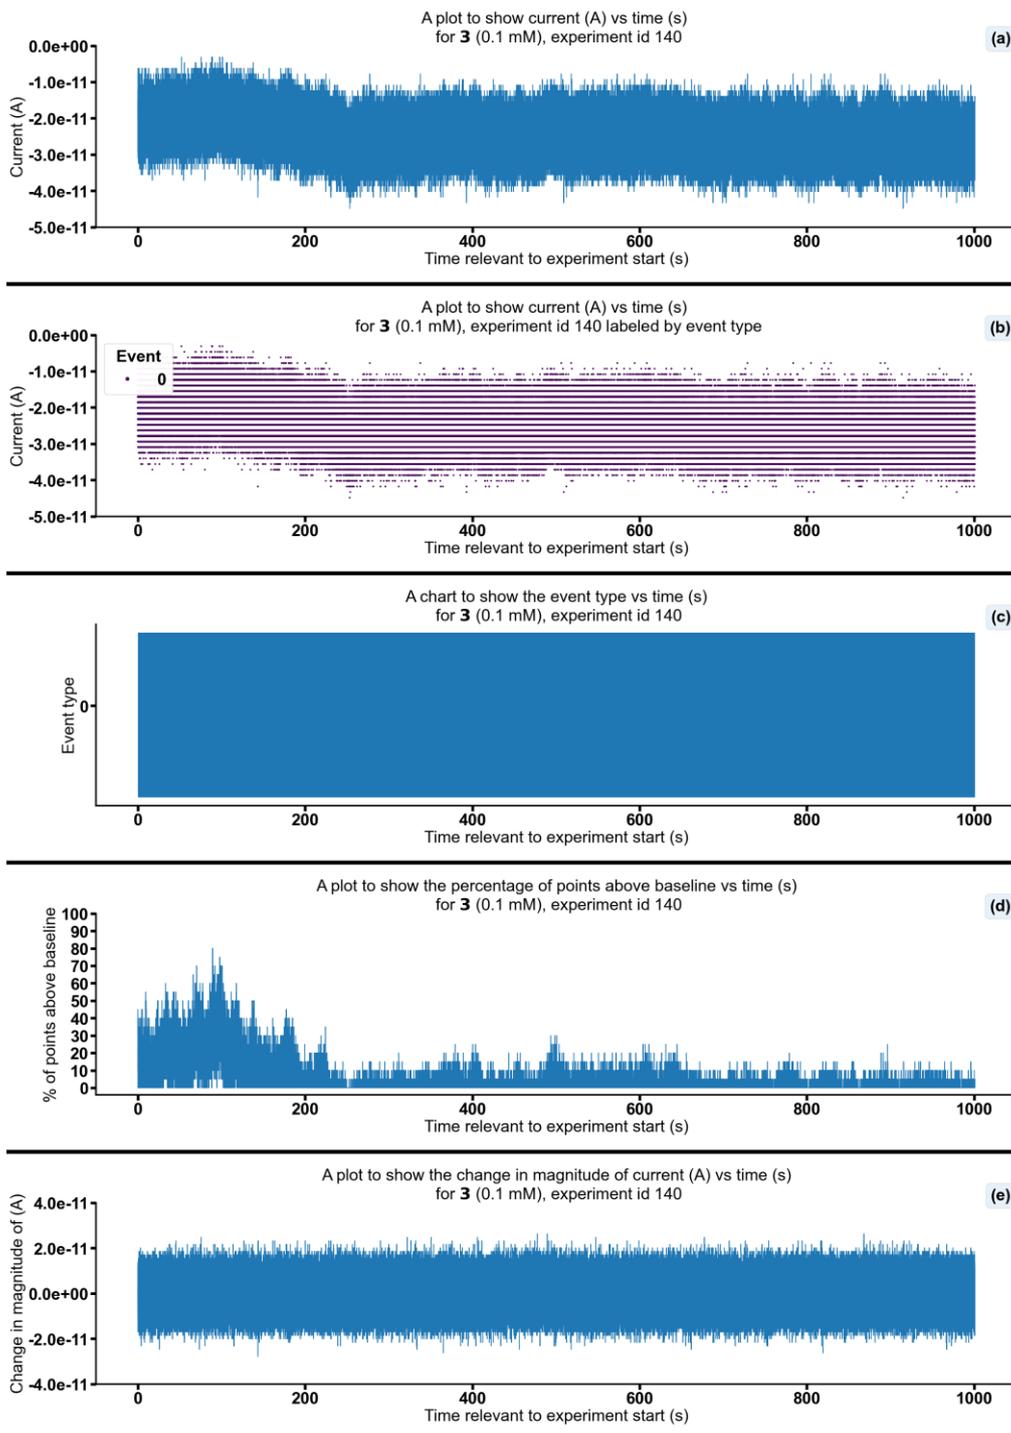

Figure S189 - Summarising the data from the patch clamp experiment for **3** (0.1 mM), experiment id 140 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00e-11$ A, 1: $5.00e-11$ A \leq Event 1 $< 5.00e-10$ A, 2: $5.00e-10$ A \leq Event 2 $< 4.90e-08$ A, 3: $4.90e-08$ A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold $-1.6e-11$ (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

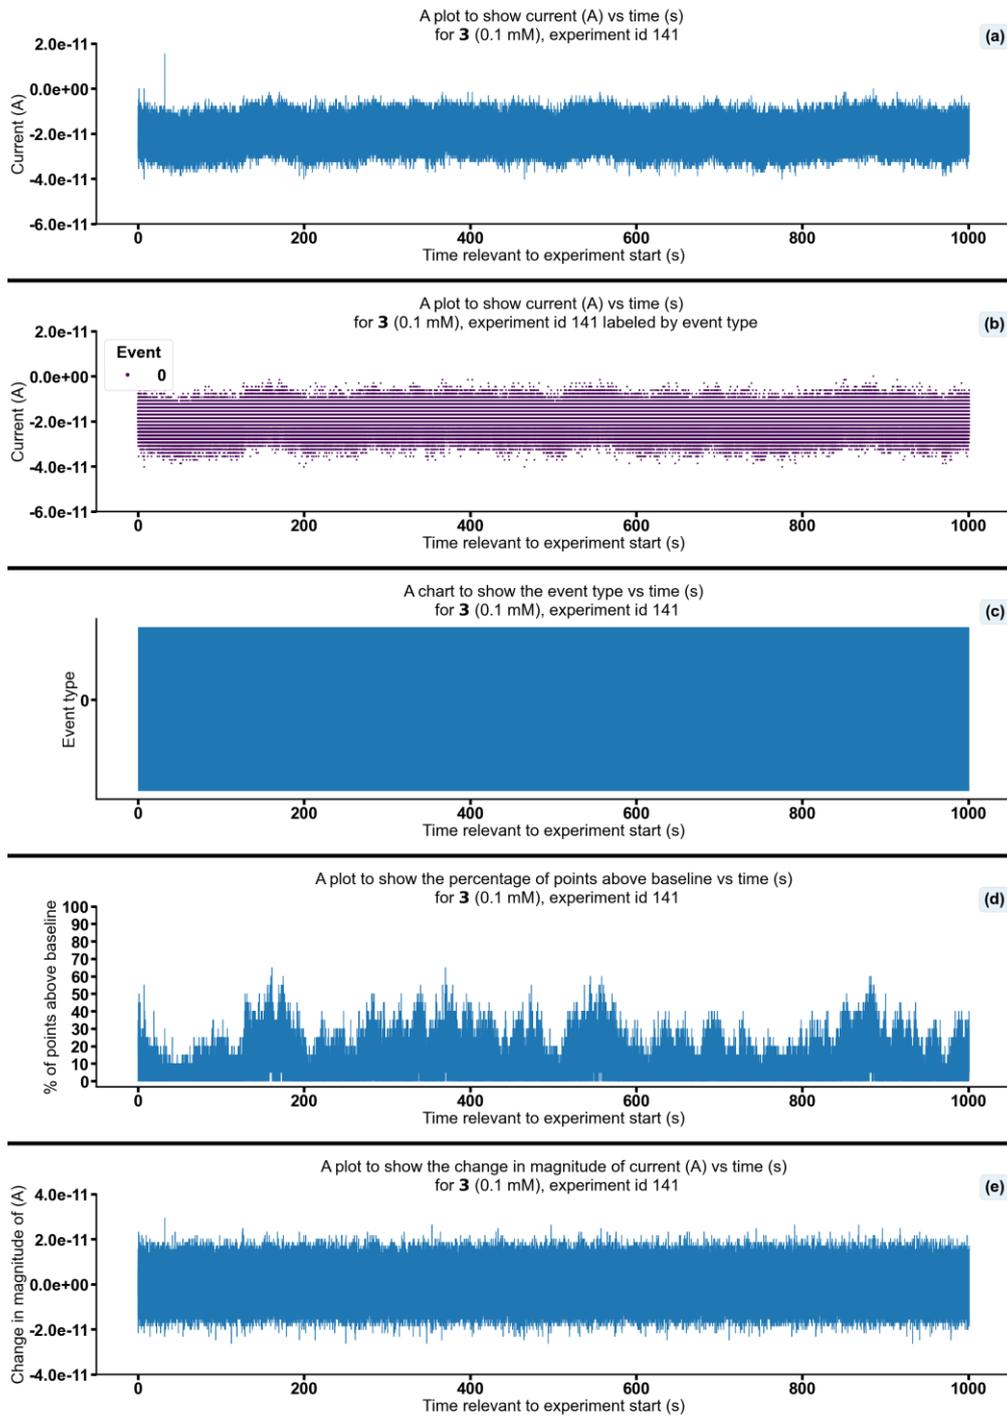

Figure S190 - Summarising the data from the patch clamp experiment for **3** (0.1 mM), experiment id 141 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.5 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

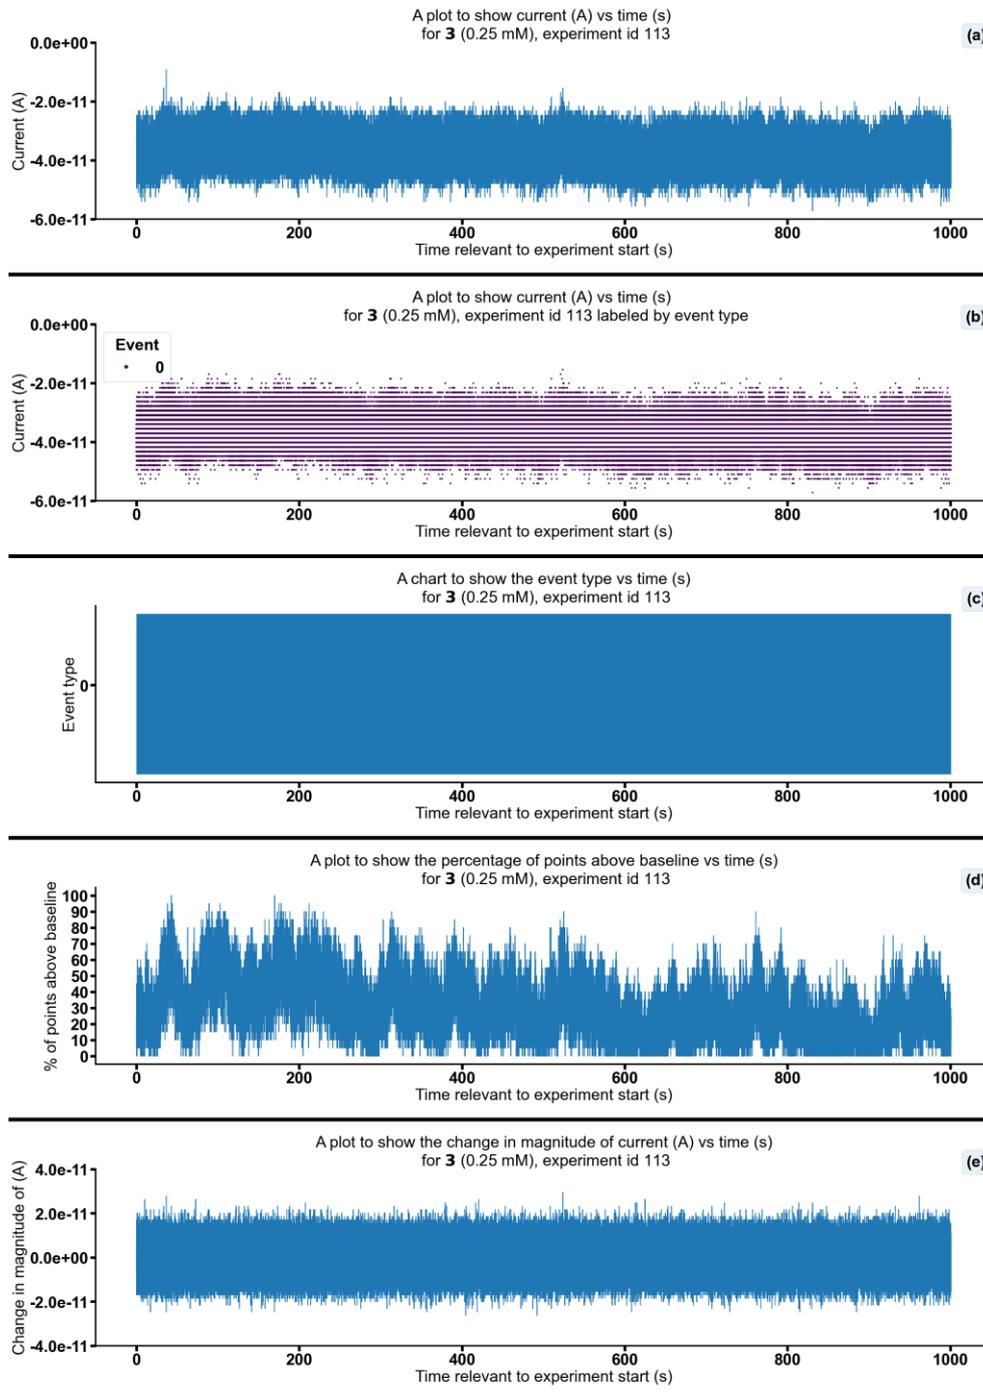

Figure S191 - Summarising the data from the patch clamp experiment for **3** (0.25 mM), experiment id 113 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00e-11 \text{ A}$, 1: $5.00e-11 \text{ A} \leq \text{Event } 1 < 5.00e-10 \text{ A}$, 2: $5.00e-10 \text{ A} \leq \text{Event } 2 < 4.90e-08 \text{ A}$, 3: $4.90e-08 \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-3.5e-11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

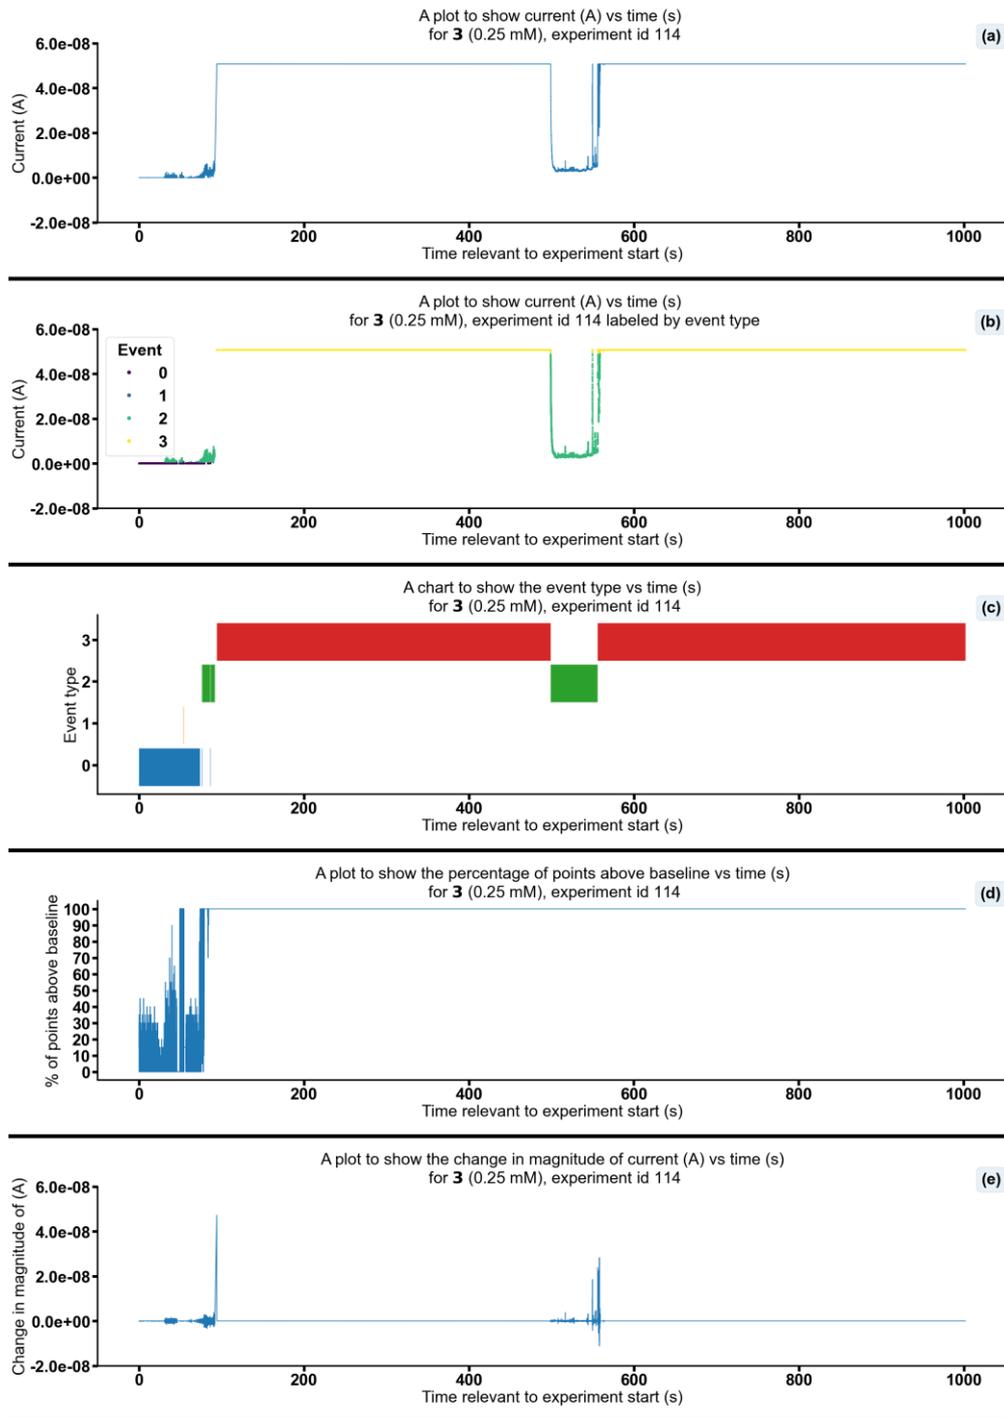

Figure S192 - Summarising the data from the patch clamp experiment for **3** (0.25 mM), experiment id 114 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $5.6 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

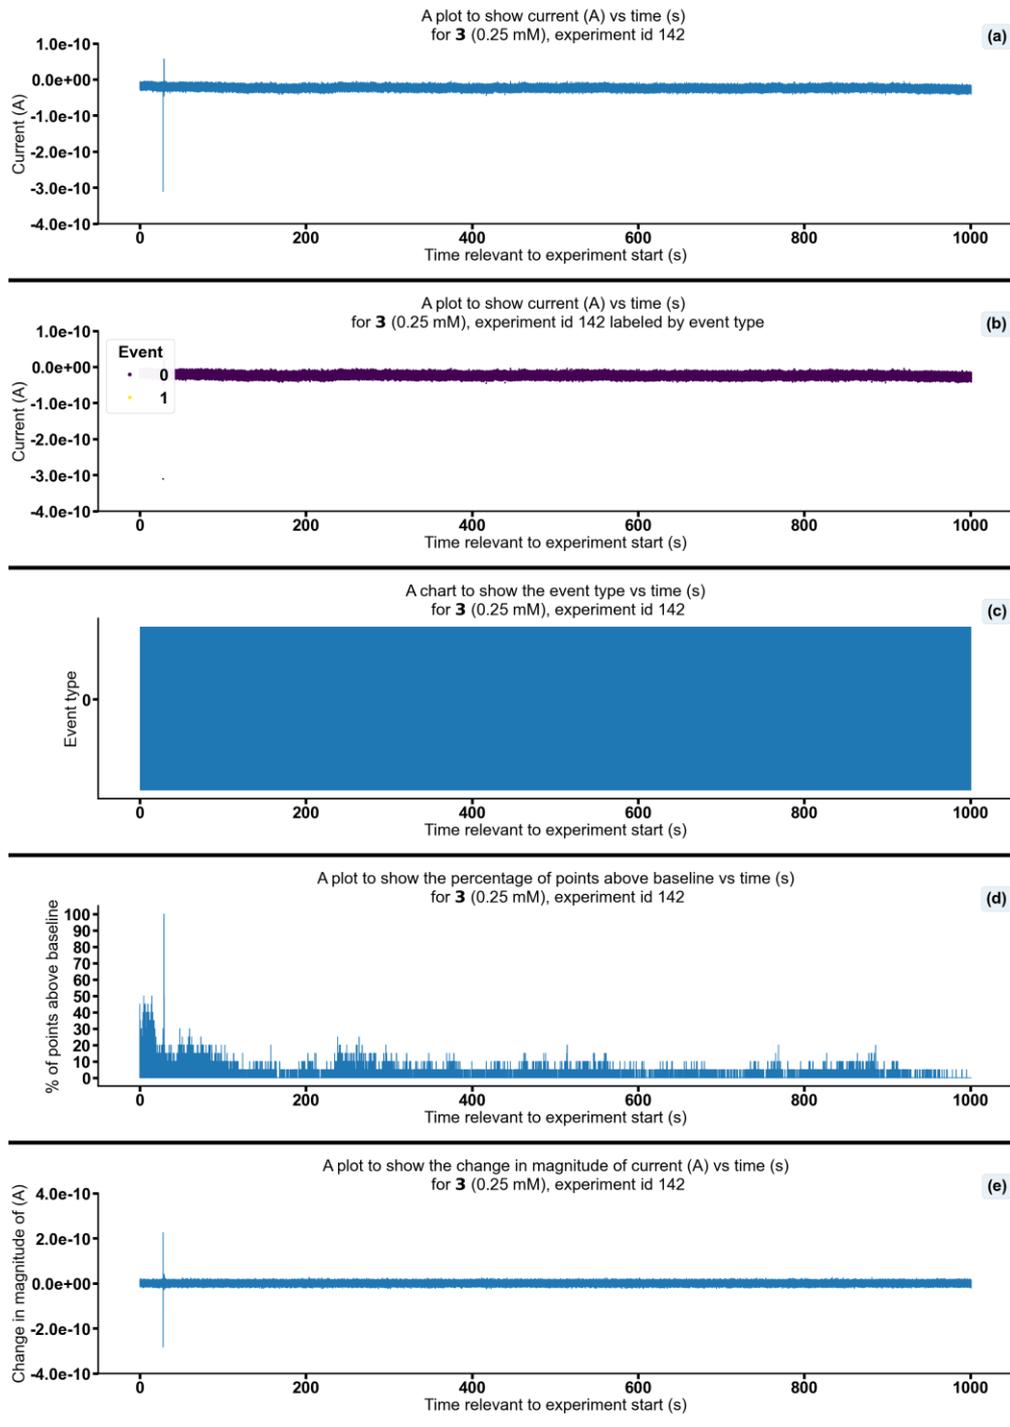

Figure S193 - Summarising the data from the patch clamp experiment for **3** (0.25 mM), experiment id 142 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.4 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

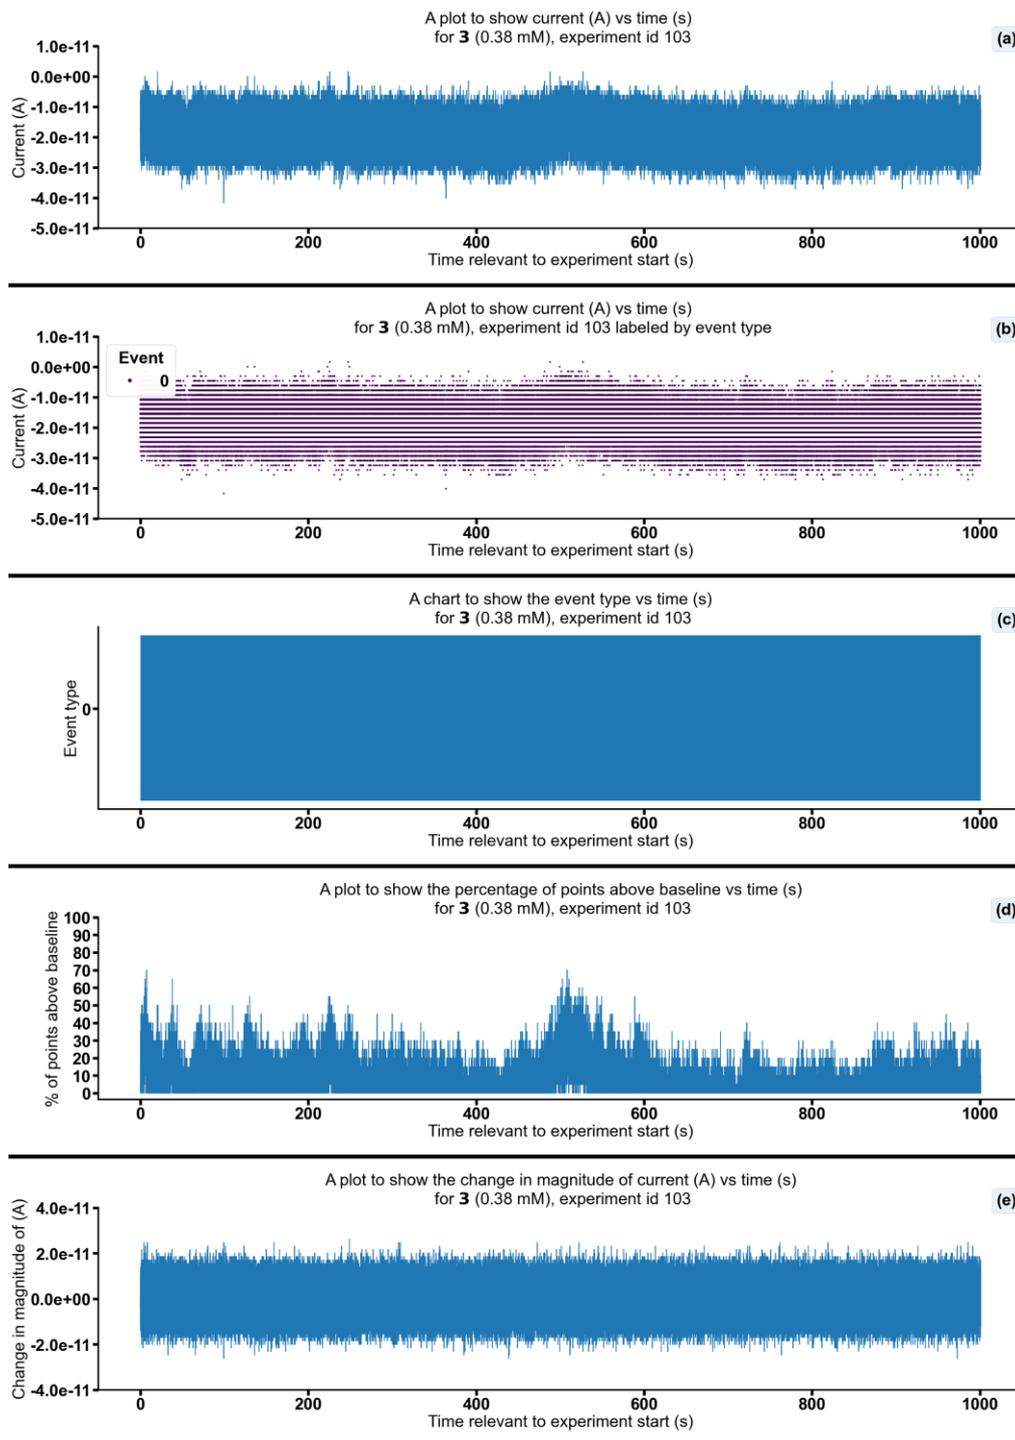

Figure S194 - Summarising the data from the patch clamp experiment for **3** (0.38 mM), experiment id 103 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold -1.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

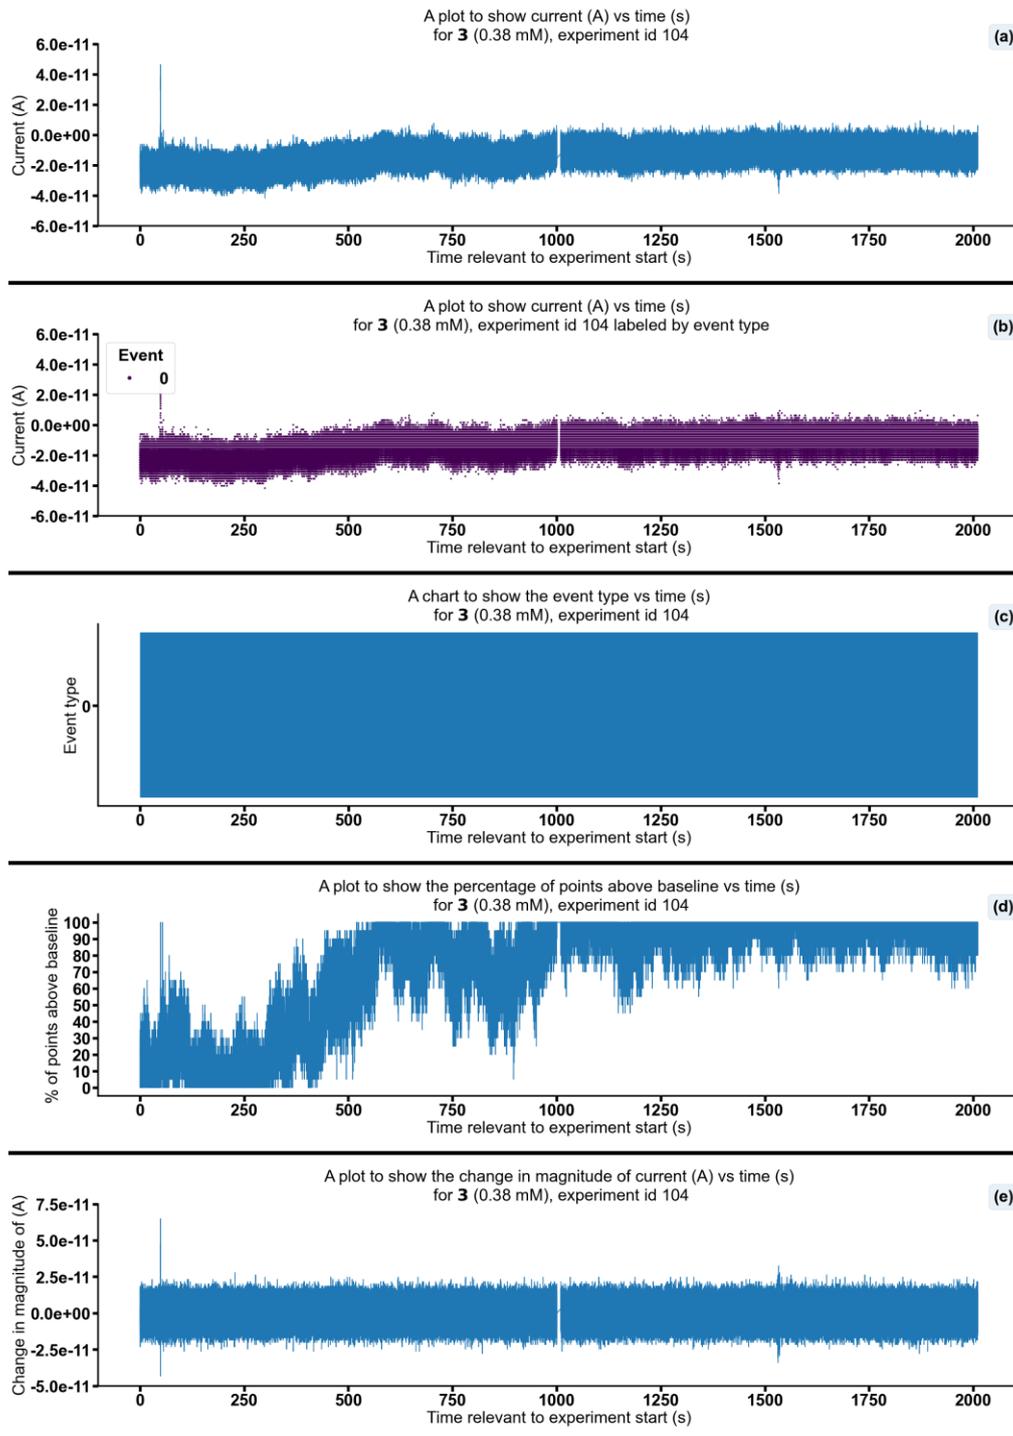

Figure S195 - Summarising the data from the patch clamp experiment for **3** (0.38 mM), experiment id 104 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.8 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

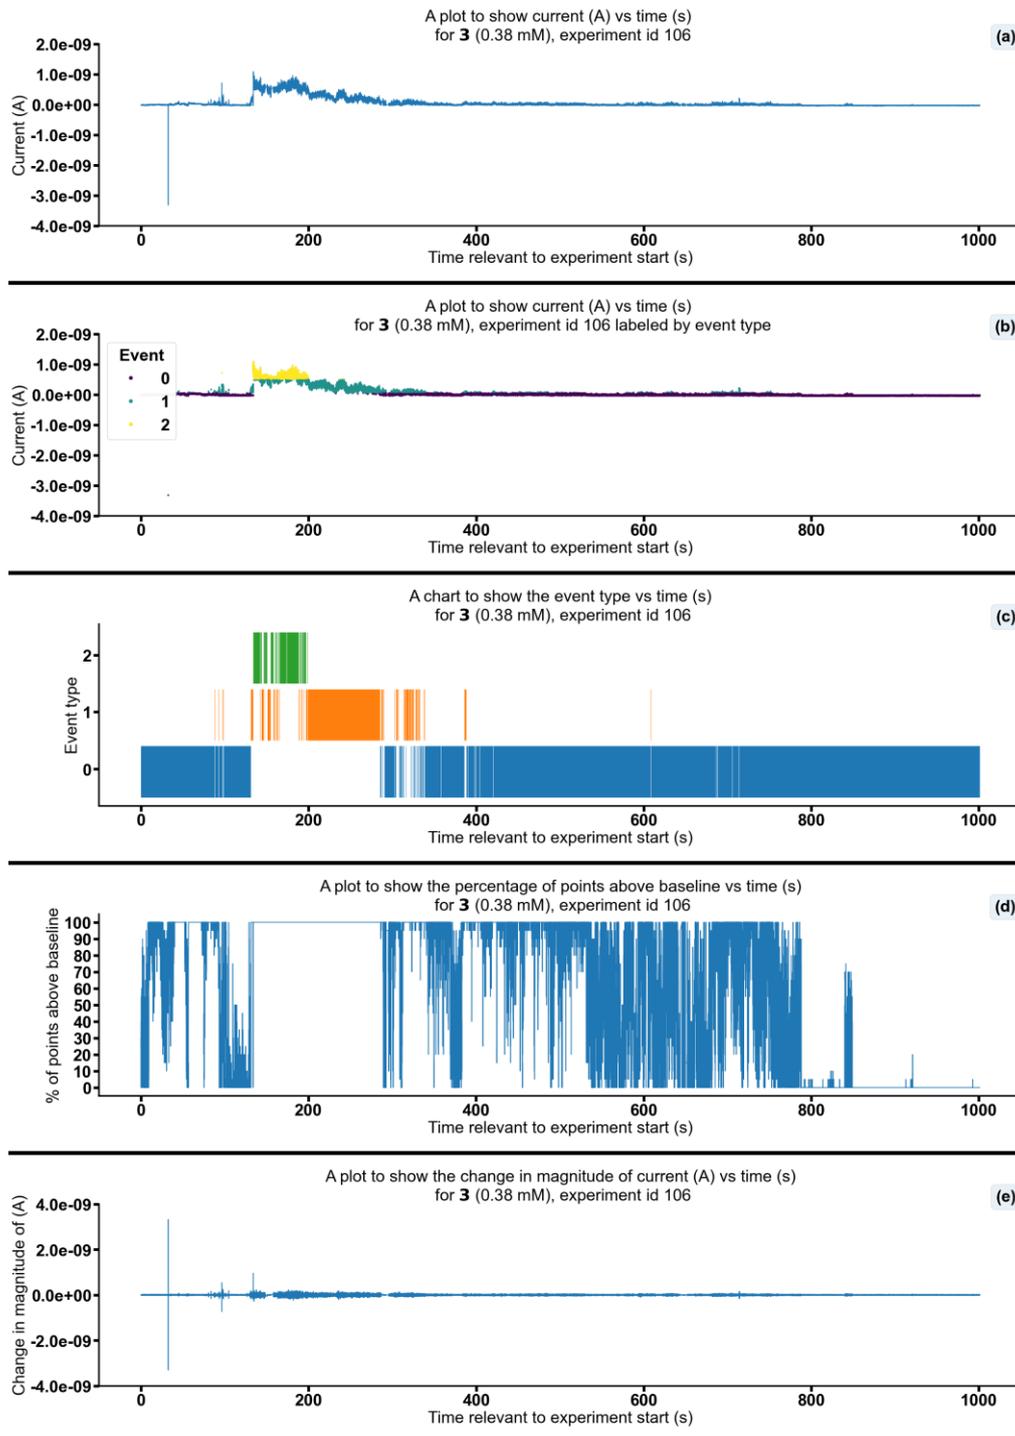

Figure S196 - Summarising the data from the patch clamp experiment for **3** (0.38 mM), experiment id 106 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.4 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

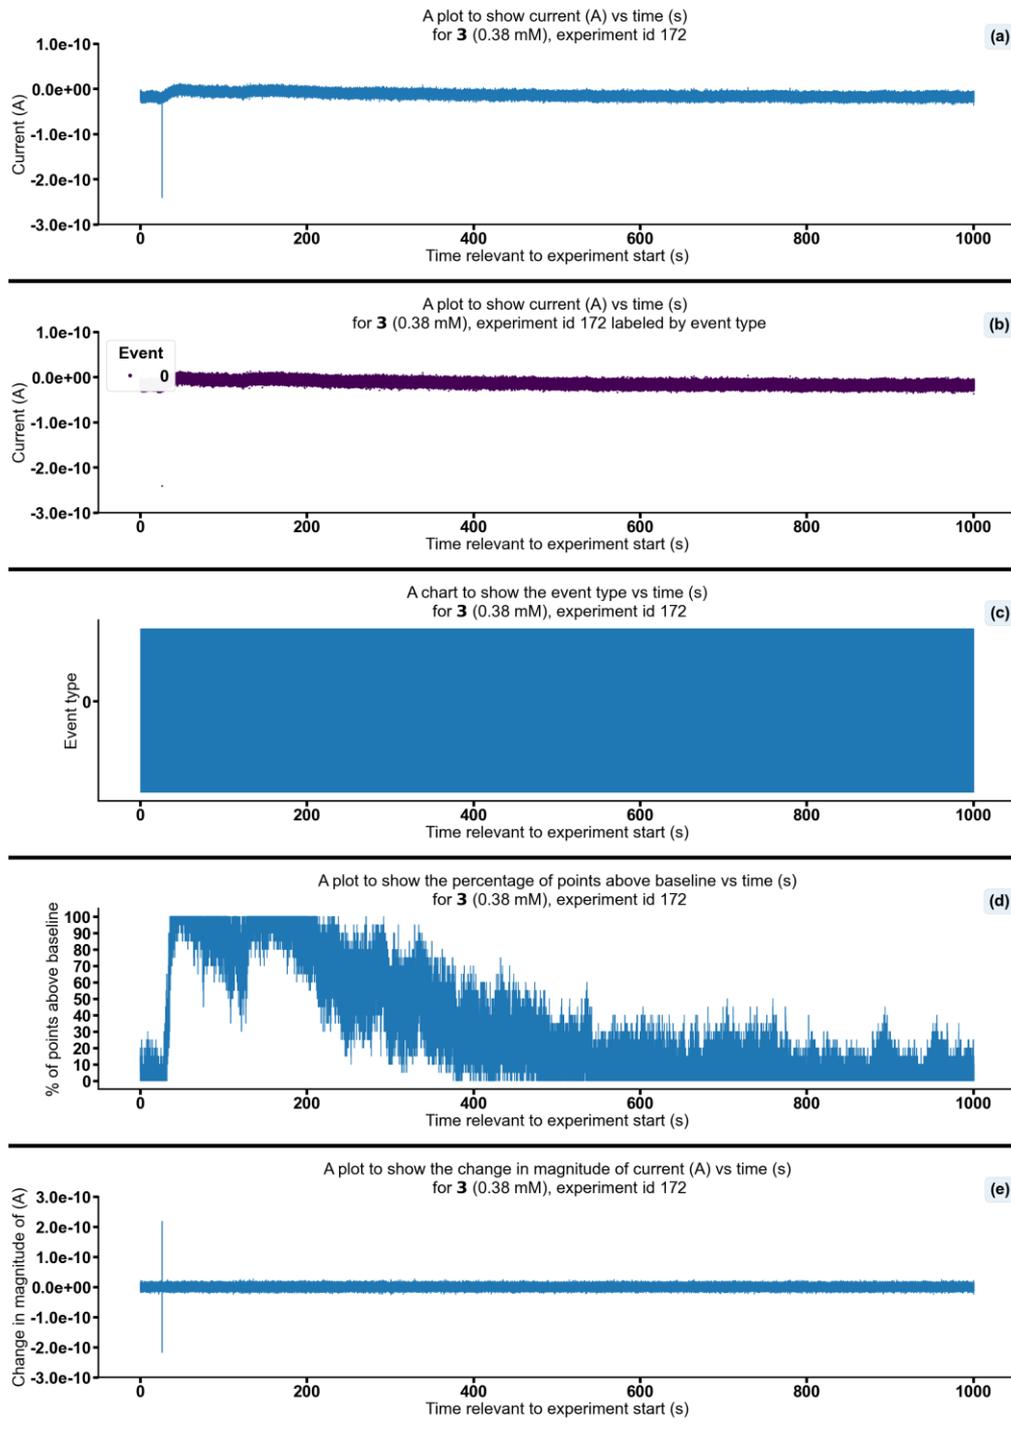

Figure S197 - Summarising the data from the patch clamp experiment for **3** (0.38 mM), experiment id 172 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00\text{e-}11 \text{ A}$, 1: $5.00\text{e-}11 \text{ A} \leq \text{Event} < 5.00\text{e-}10 \text{ A}$, 2: $5.00\text{e-}10 \text{ A} \leq \text{Event} < 4.90\text{e-}08 \text{ A}$, 3: $4.90\text{e-}08 \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.2\text{e-}11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

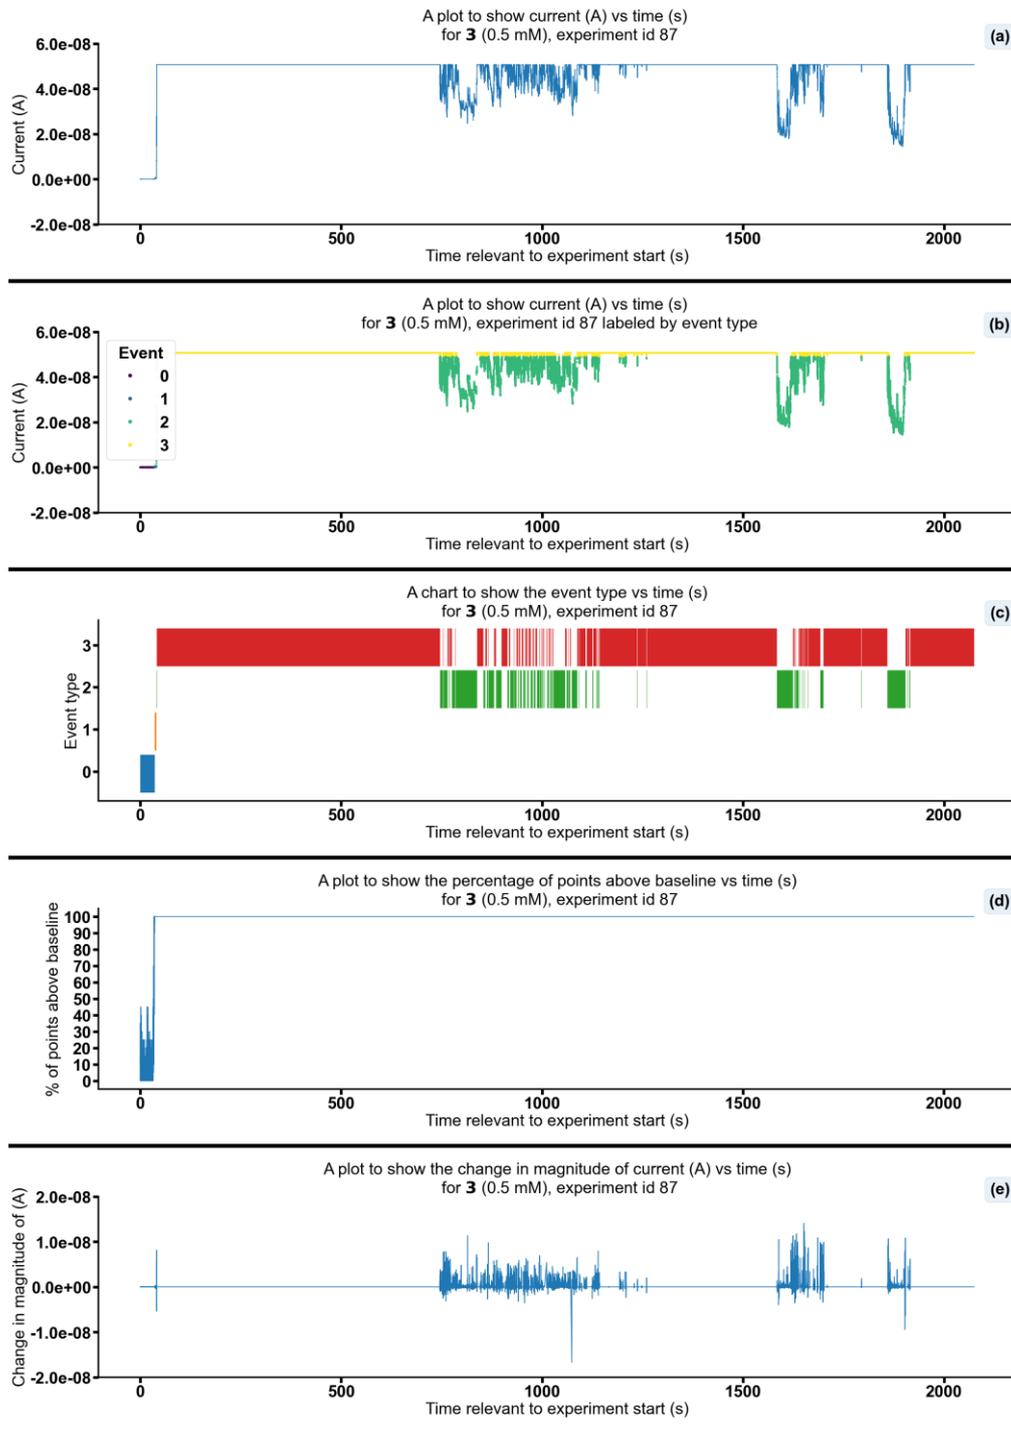

Figure S198 - Summarising the data from the patch clamp experiment for **3** (0.5 mM), experiment id 87 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 1.2×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

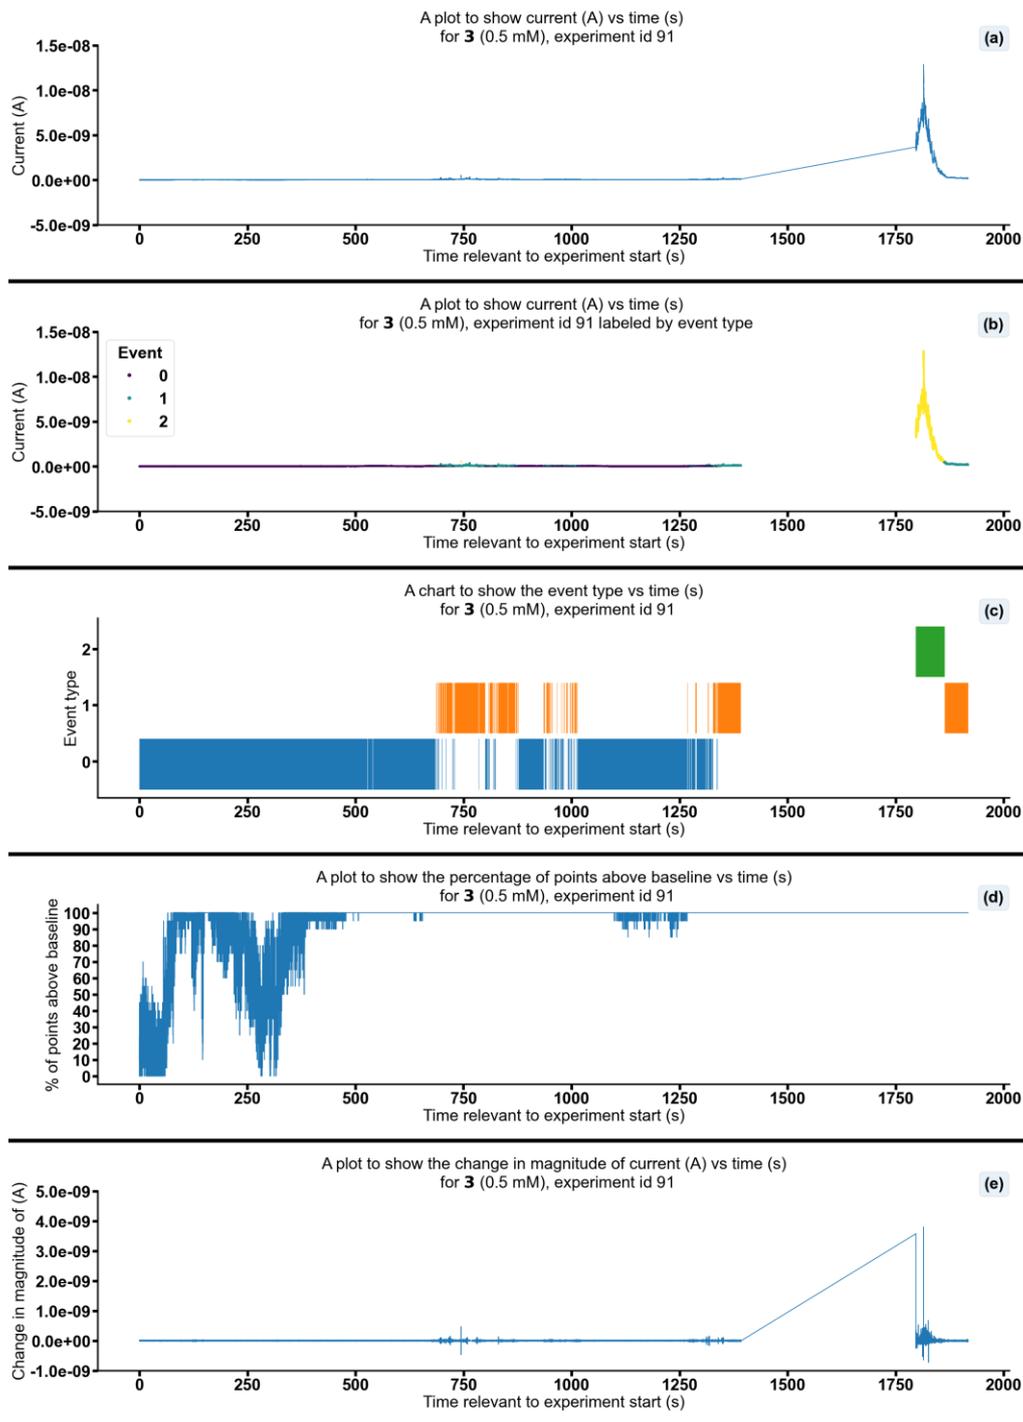

Figure S199 - Summarising the data from the patch clamp experiment for **3** (0.5 mM), experiment id 91 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 1.0×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

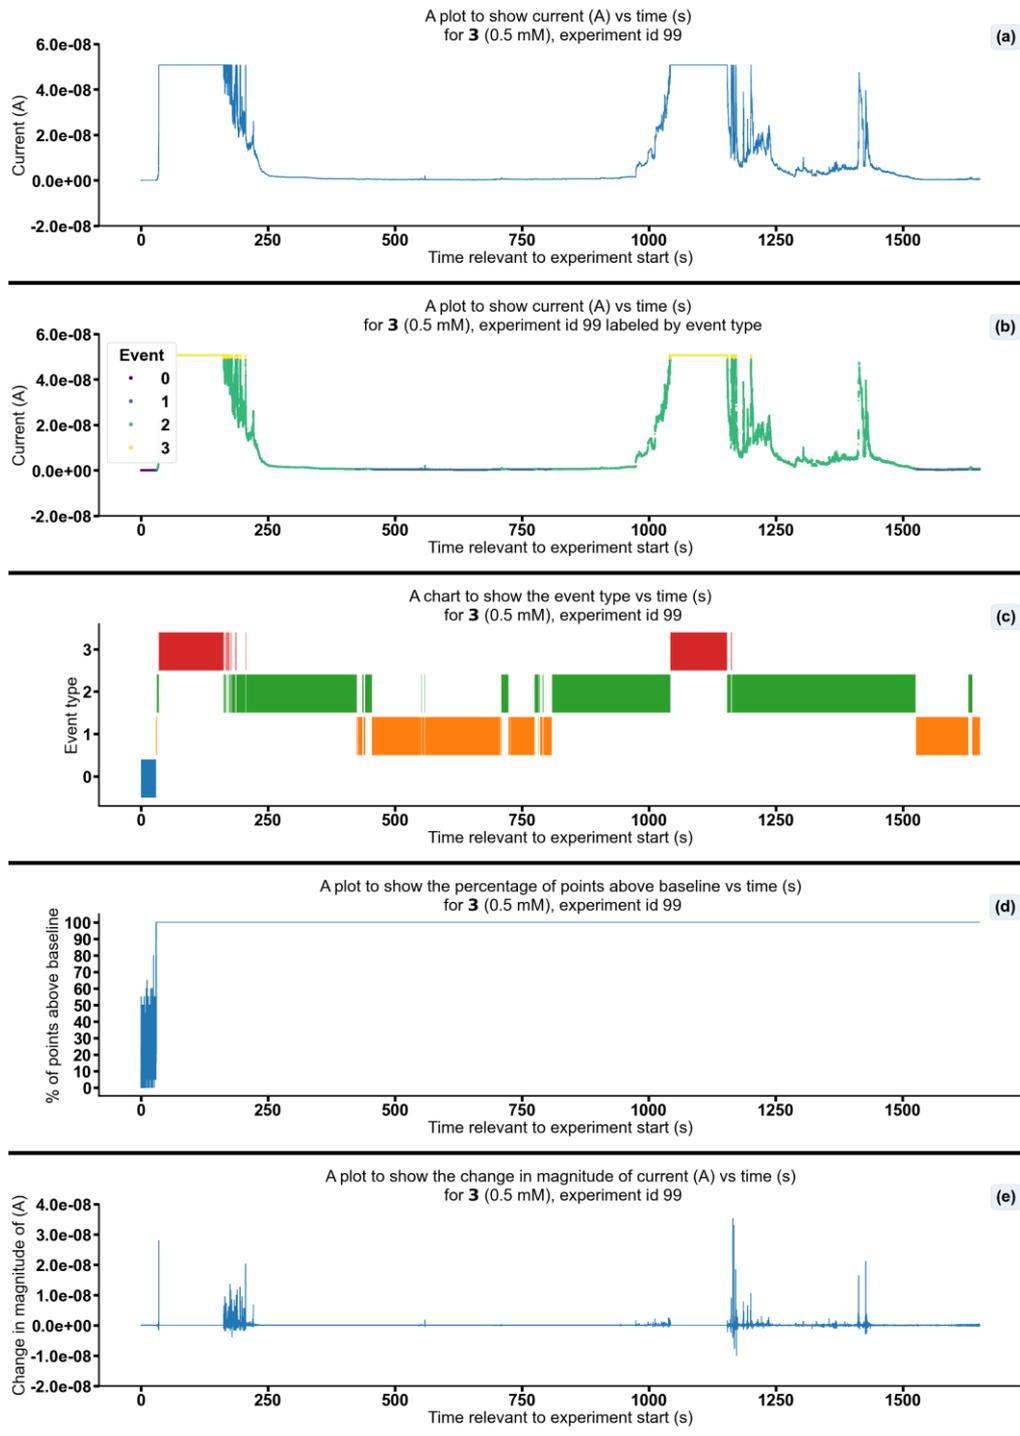

Figure S200 - Summarising the data from the patch clamp experiment for **3** (0.5 mM), experiment id 99 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 1.7×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

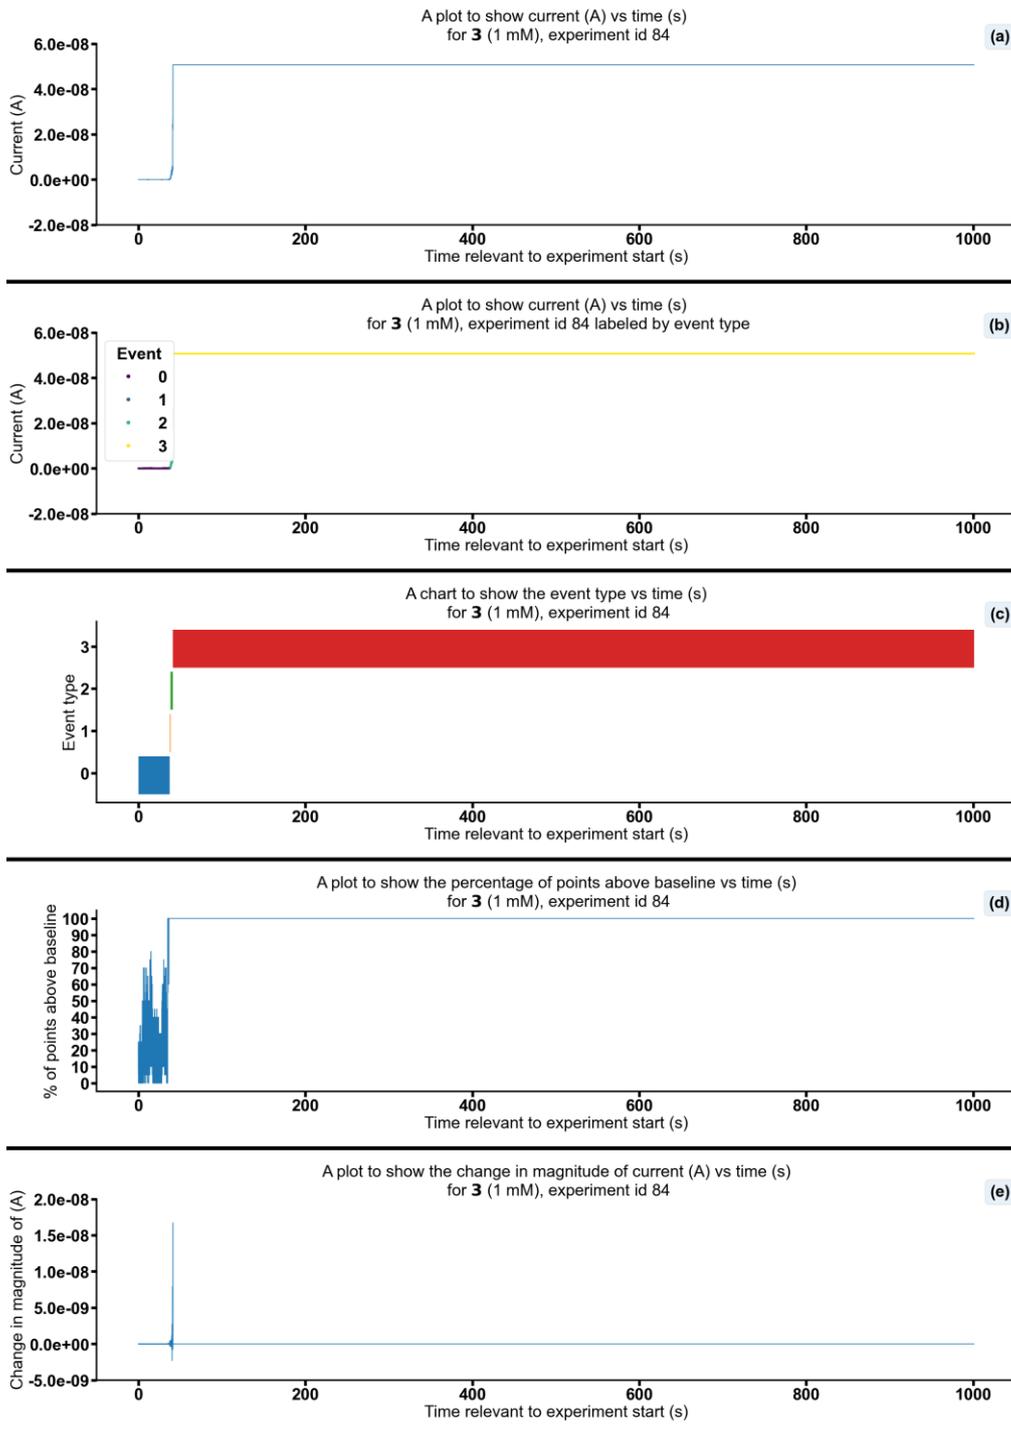

Figure S201 - Summarising the data from the patch clamp experiment for **3** (1 mM), experiment id 84 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -1.1×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

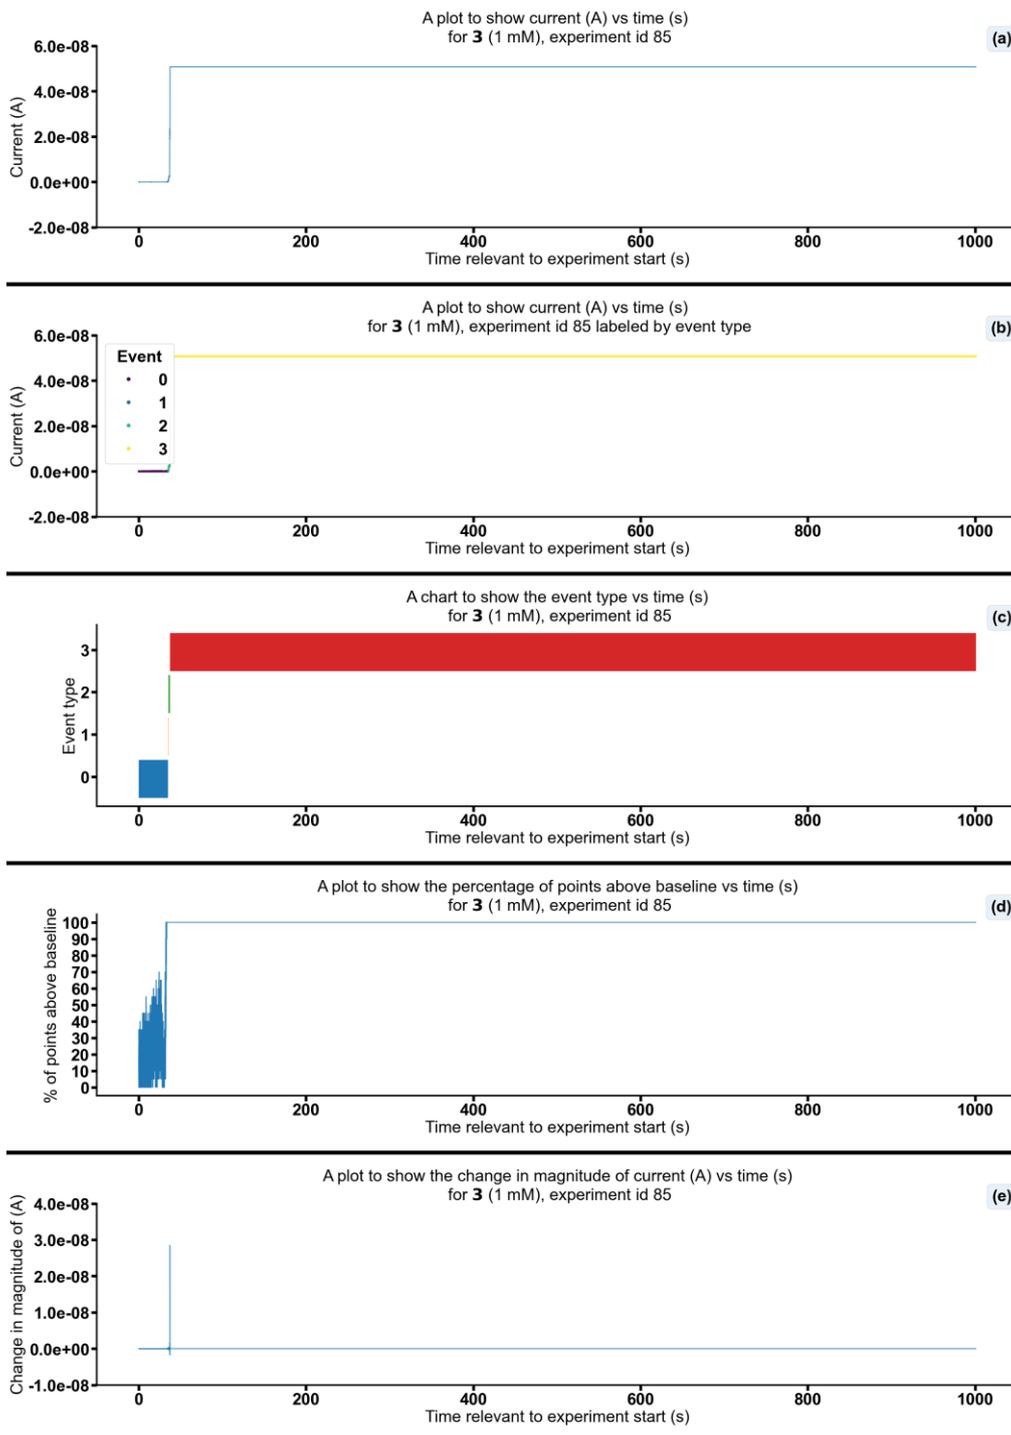

Figure S202 - Summarising the data from the patch clamp experiment for **3** (1 mM), experiment id 85 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -9.1×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

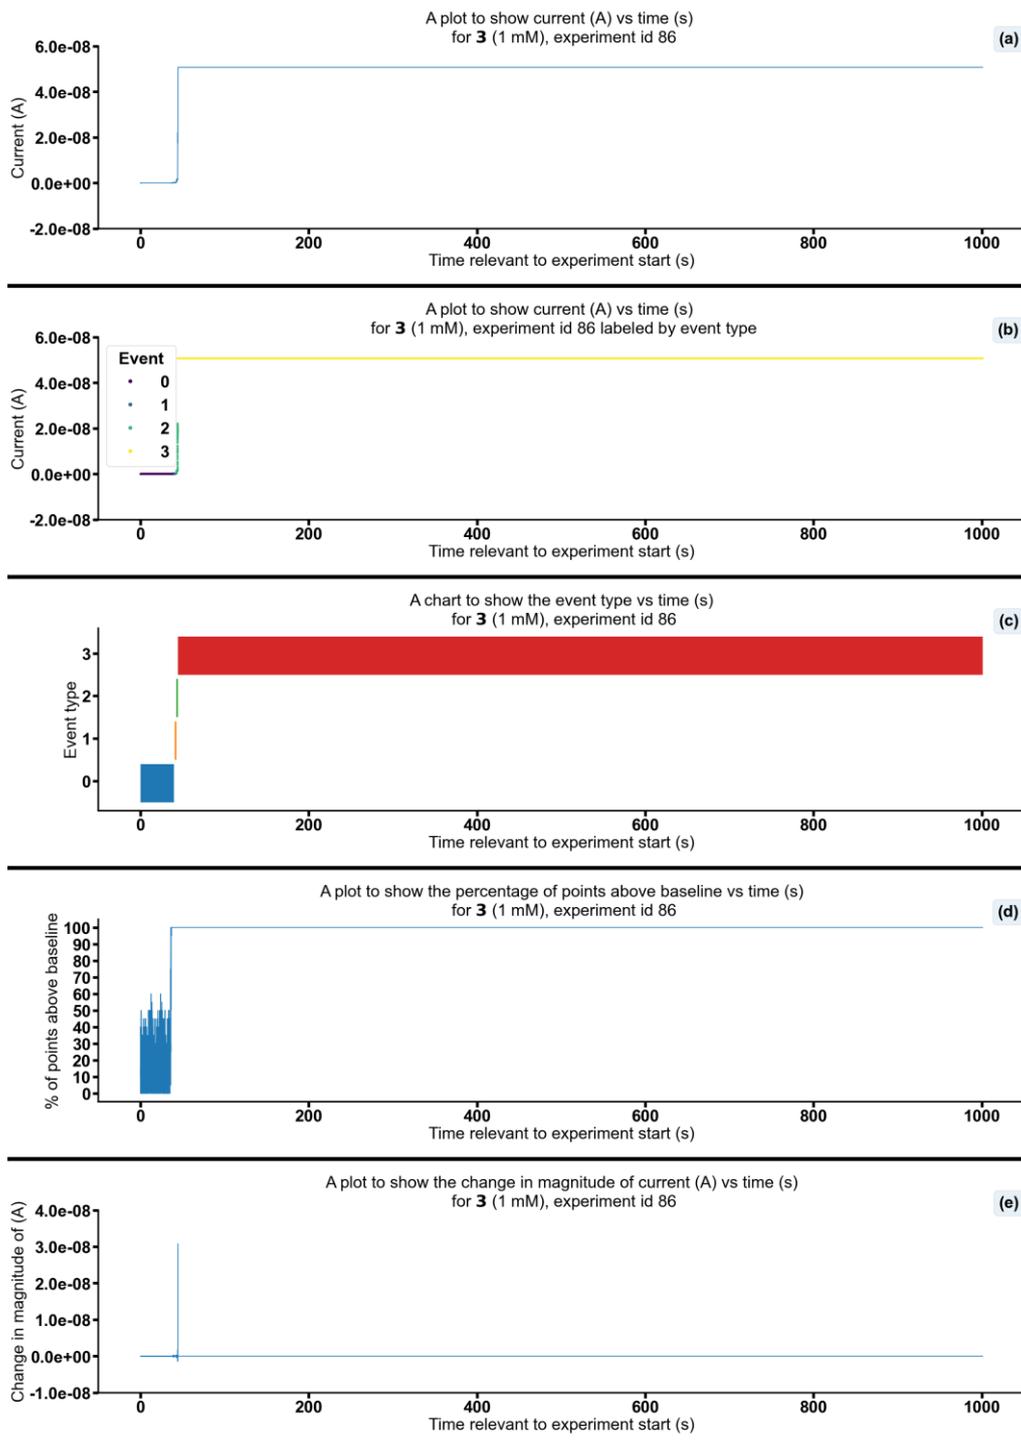

Figure S203 - Summarising the data from the patch clamp experiment for **3** (1 mM), experiment id 86 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -5.4×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing the concentration of 5

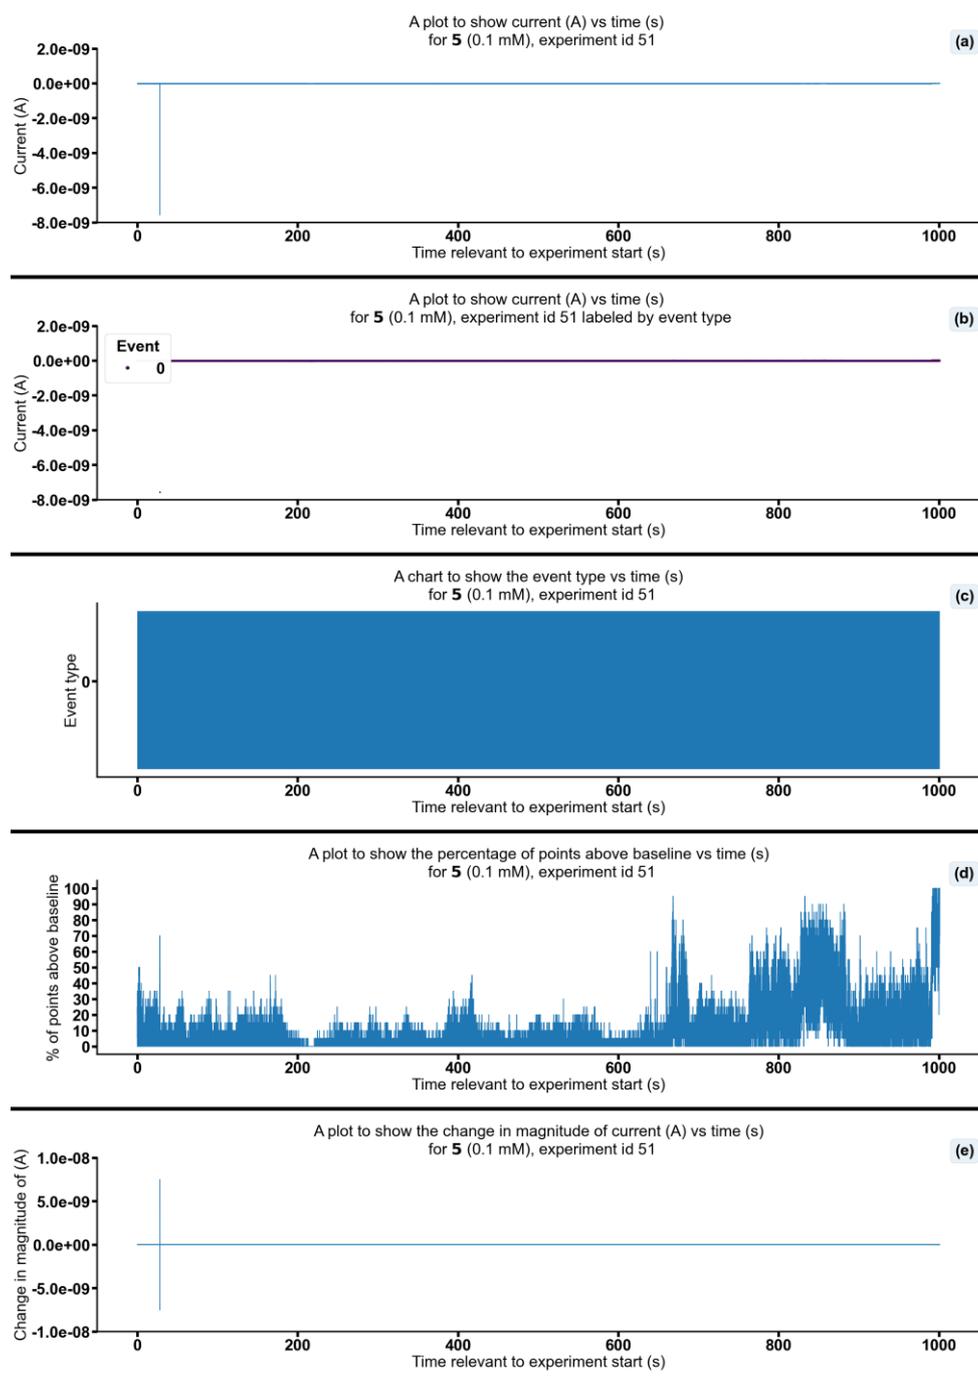

Figure S204 - Summarising the data from the patch clamp experiment for 5 (0.1 mM), experiment id 51 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.4×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

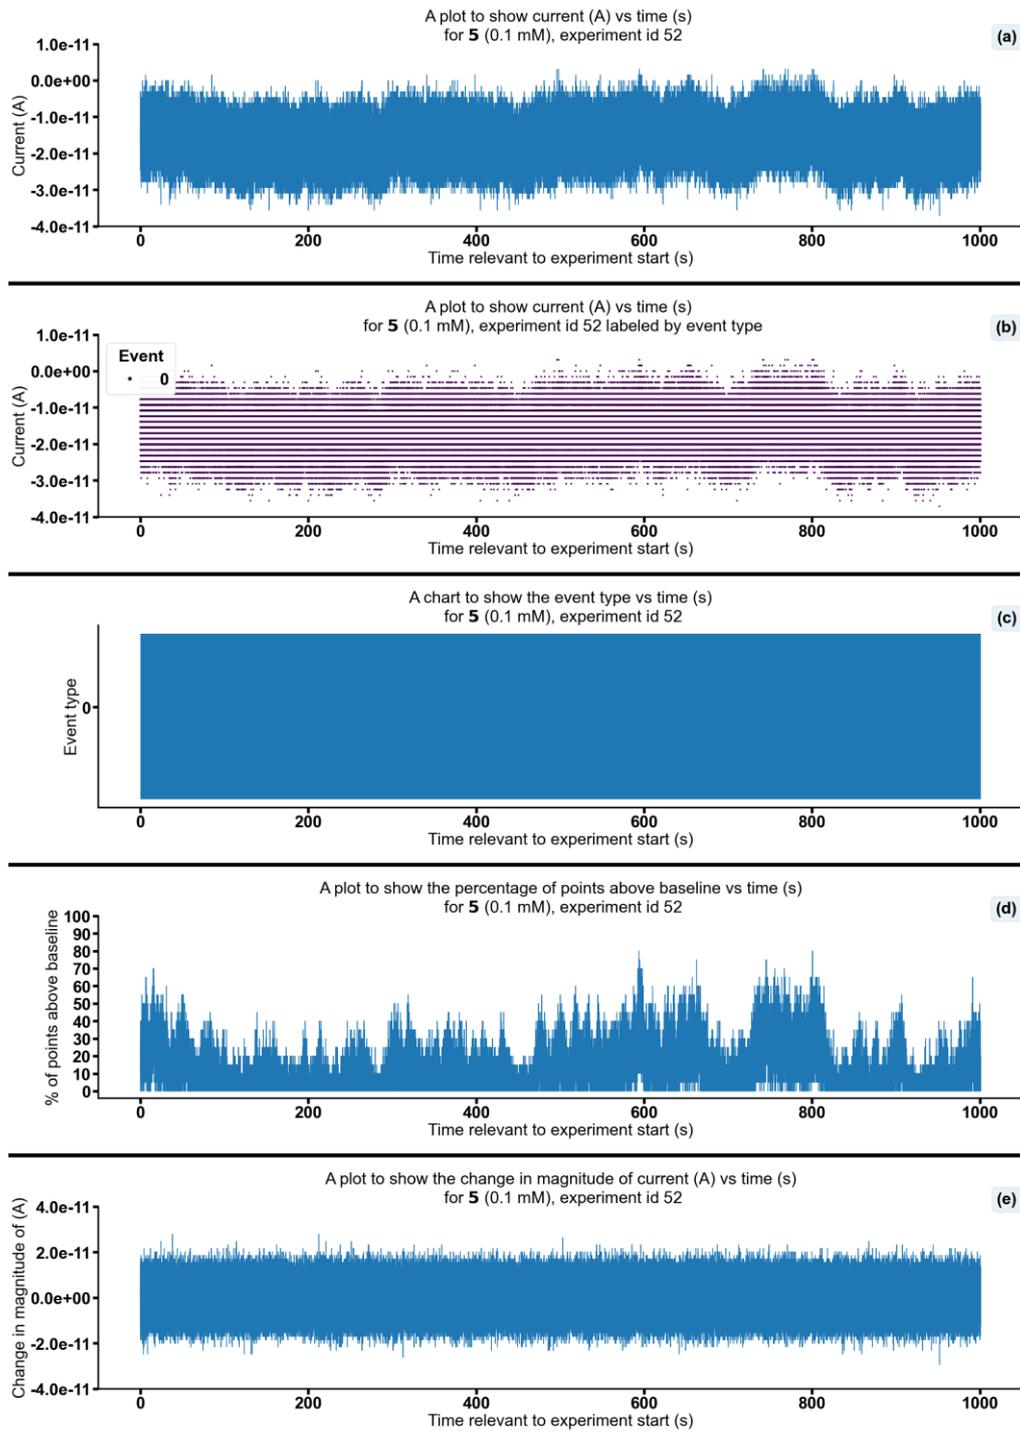

Figure S205 - Summarising the data from the patch clamp experiment for 5 (0.1 mM), experiment id 52 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.1×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

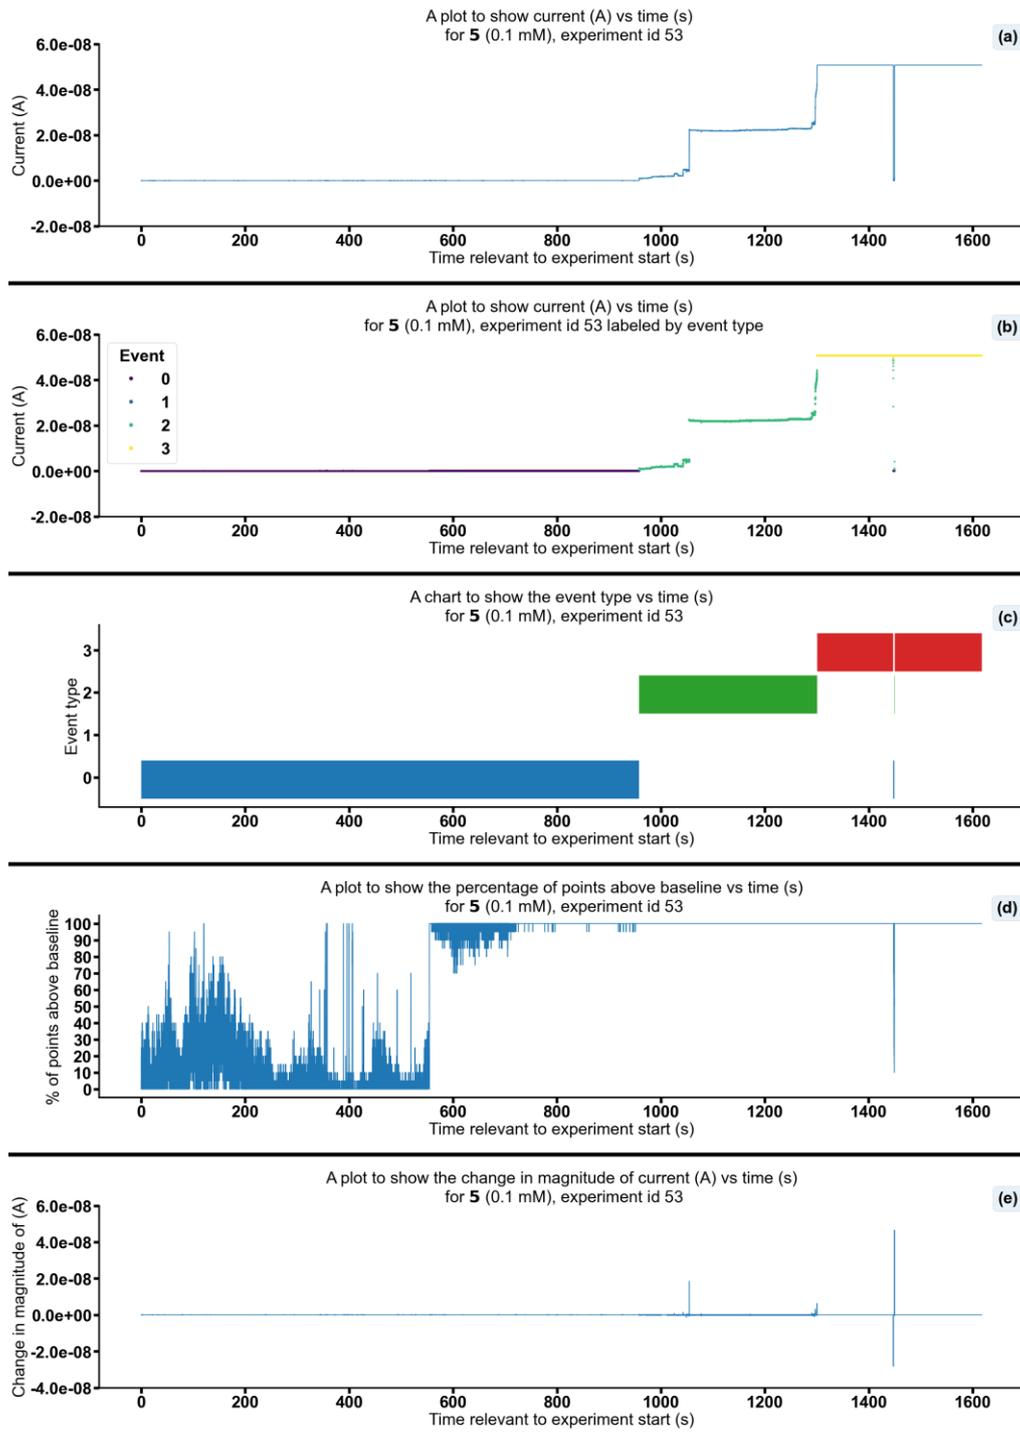

Figure S206 - Summarising the data from the patch clamp experiment for 5 (0.1 mM), experiment id 53 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -1.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

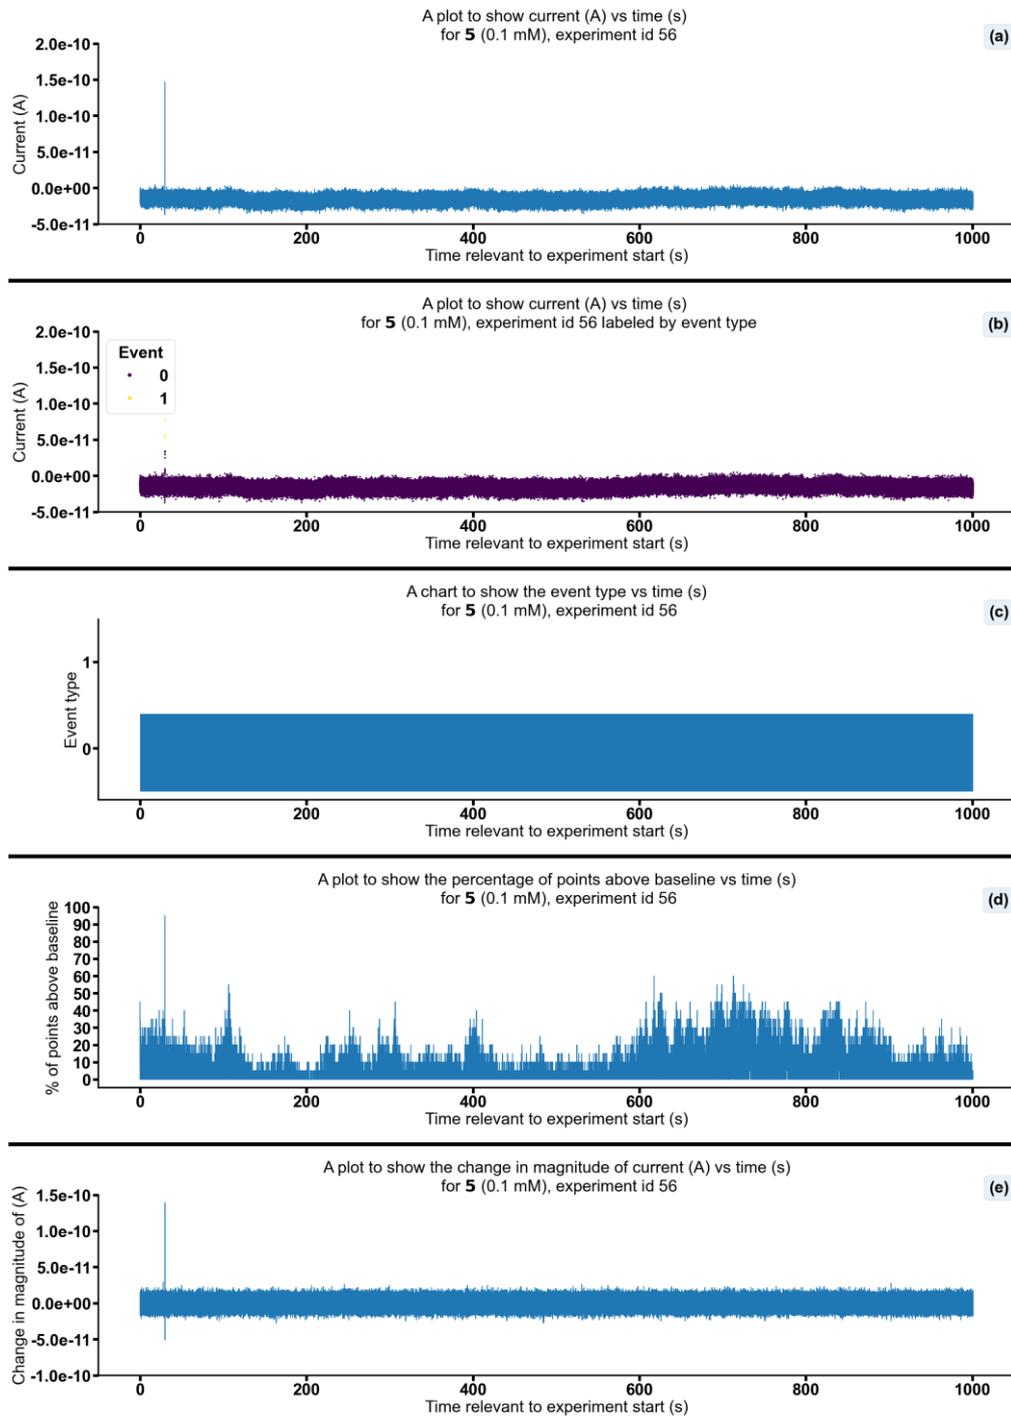

Figure S207 - Summarising the data from the patch clamp experiment for 5 (0.1 mM), experiment id 56 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -8.2×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

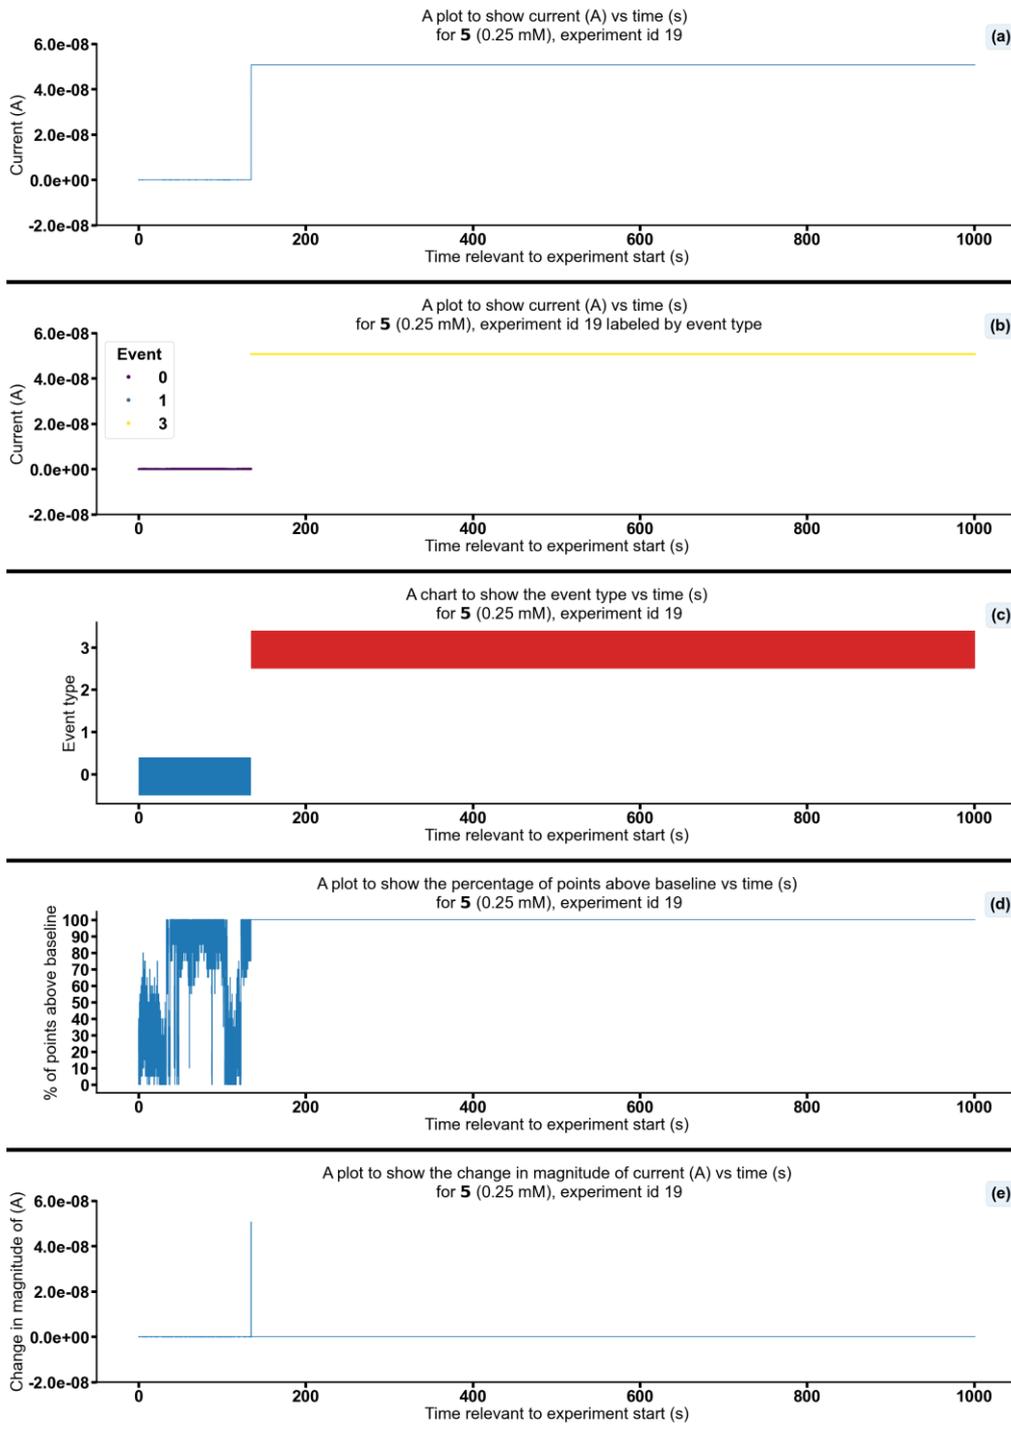

Figure S208 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 19 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -9.4×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

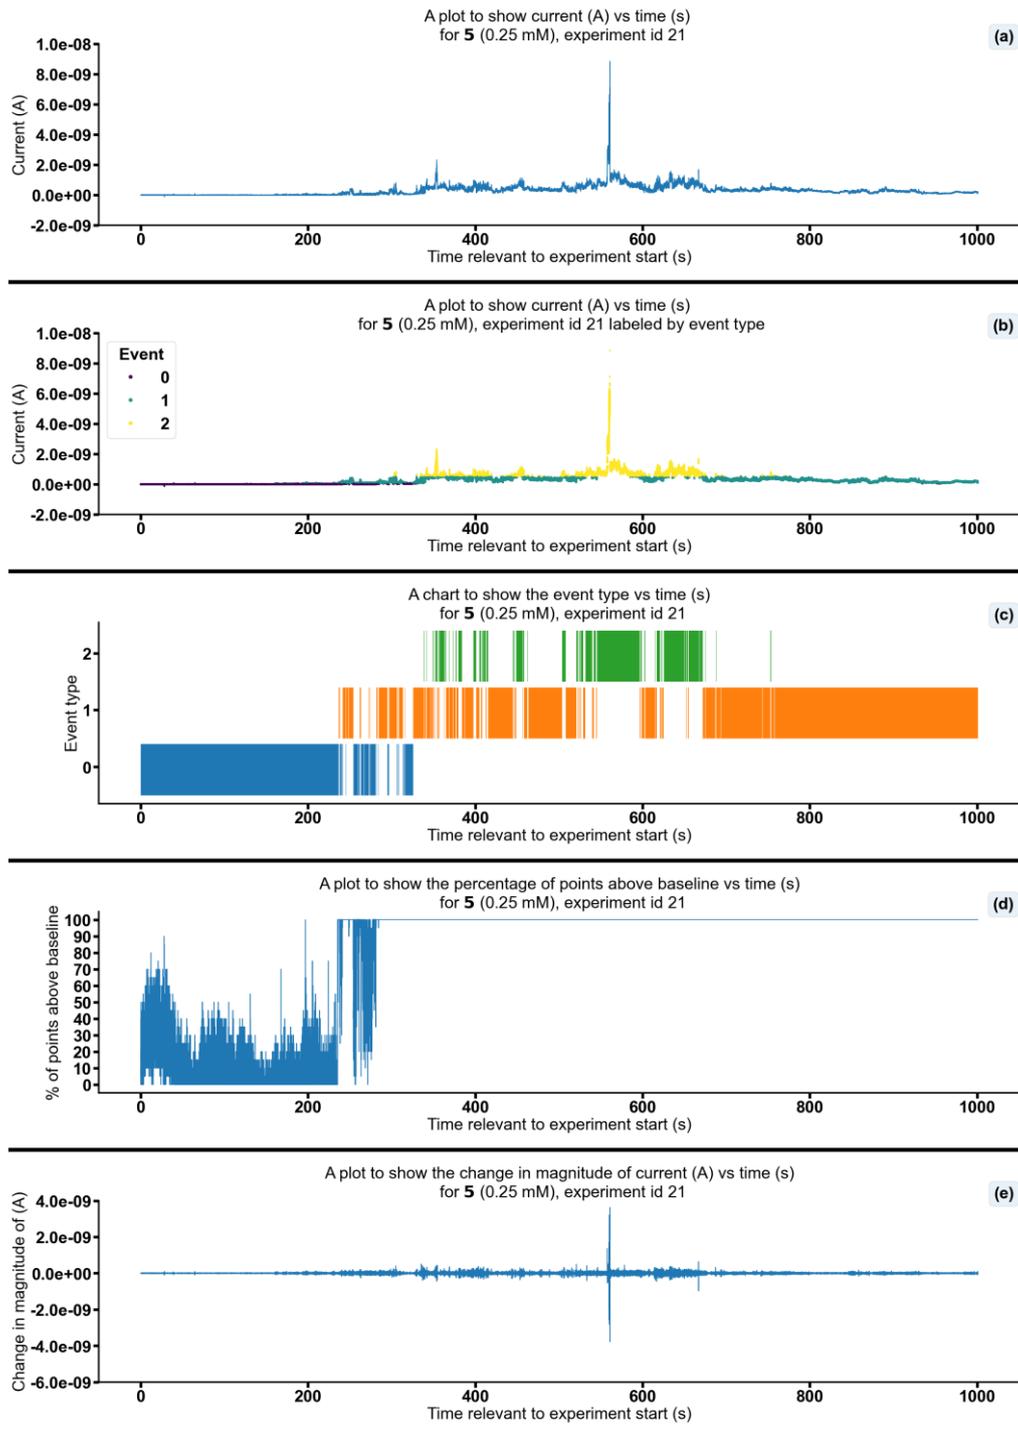

Figure S209- Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 21 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-8.6 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

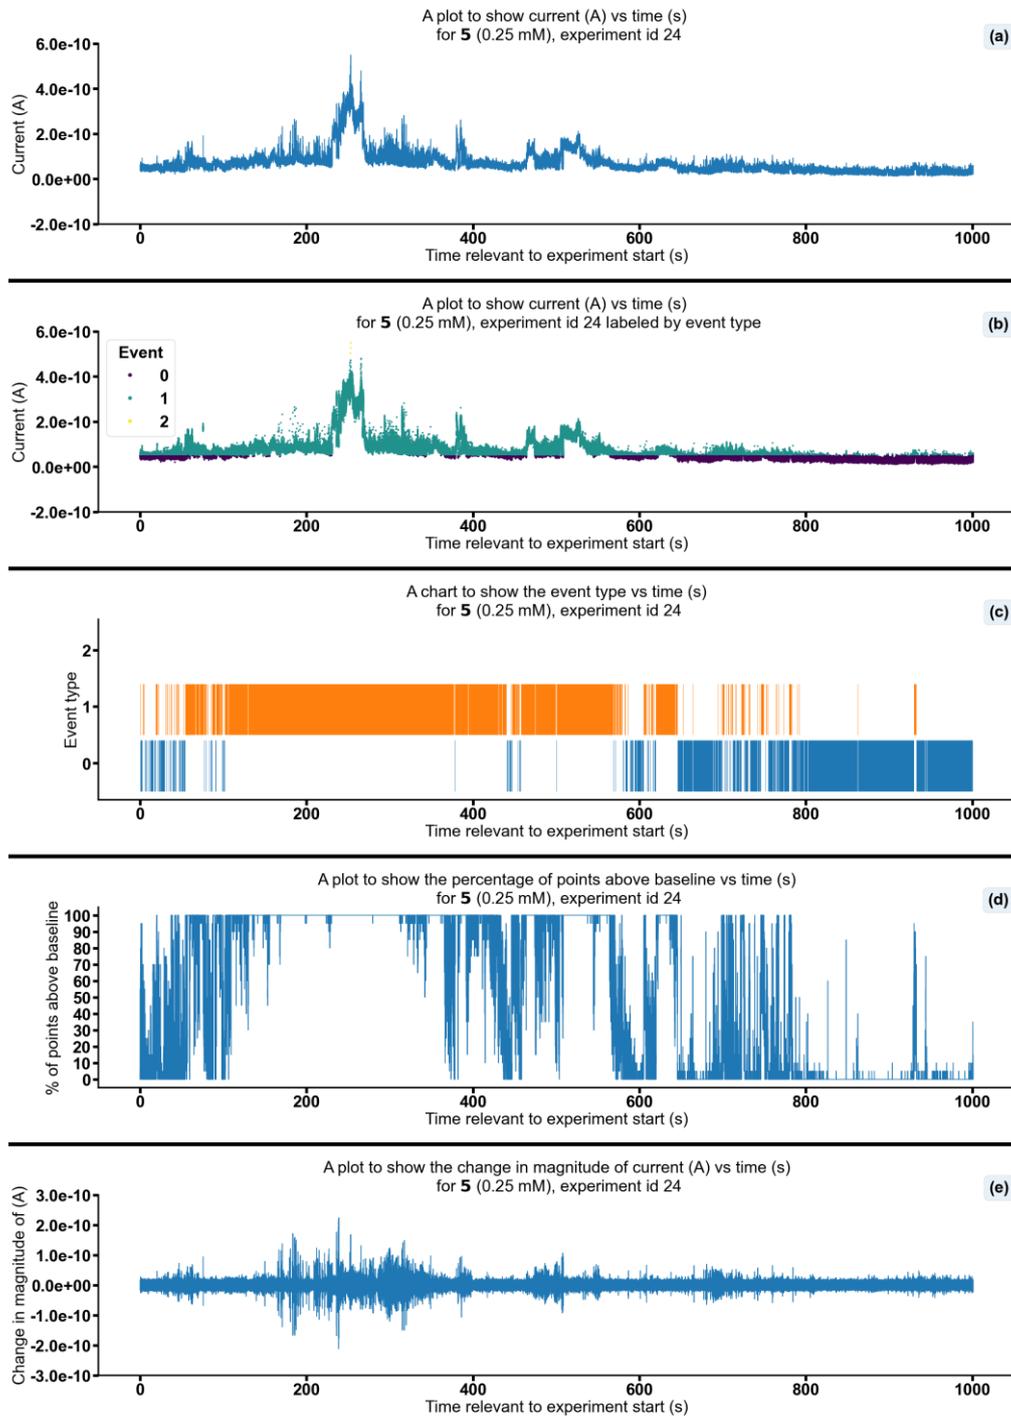

Figure S210 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 24 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $5.5 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

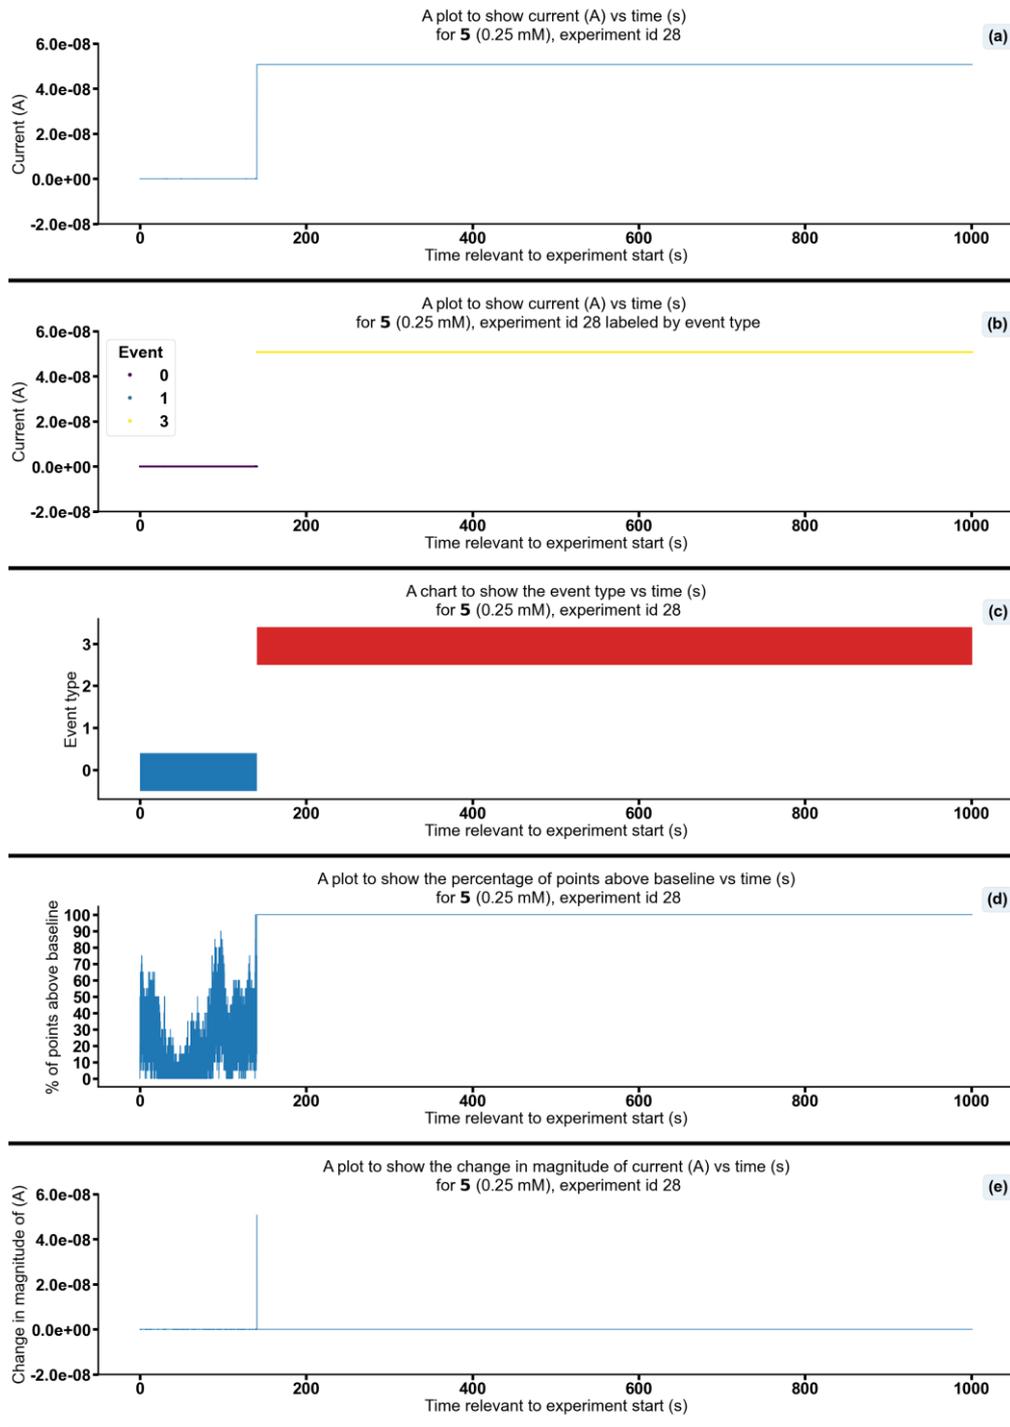

Figure S211 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 28 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.9×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

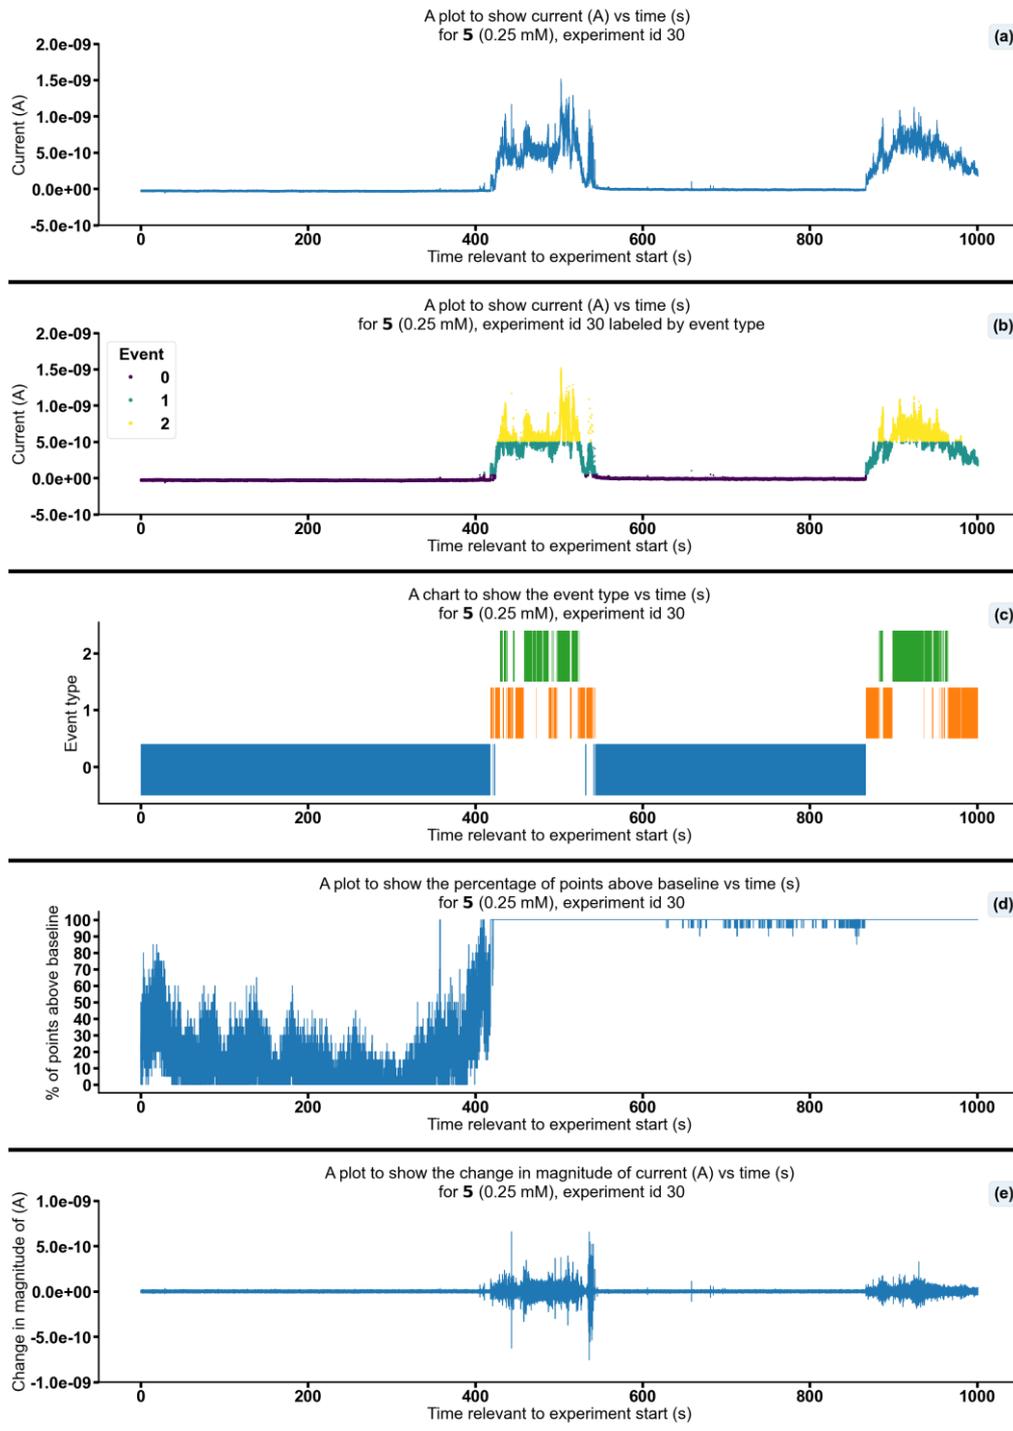

Figure S212 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 30 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -2.5×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

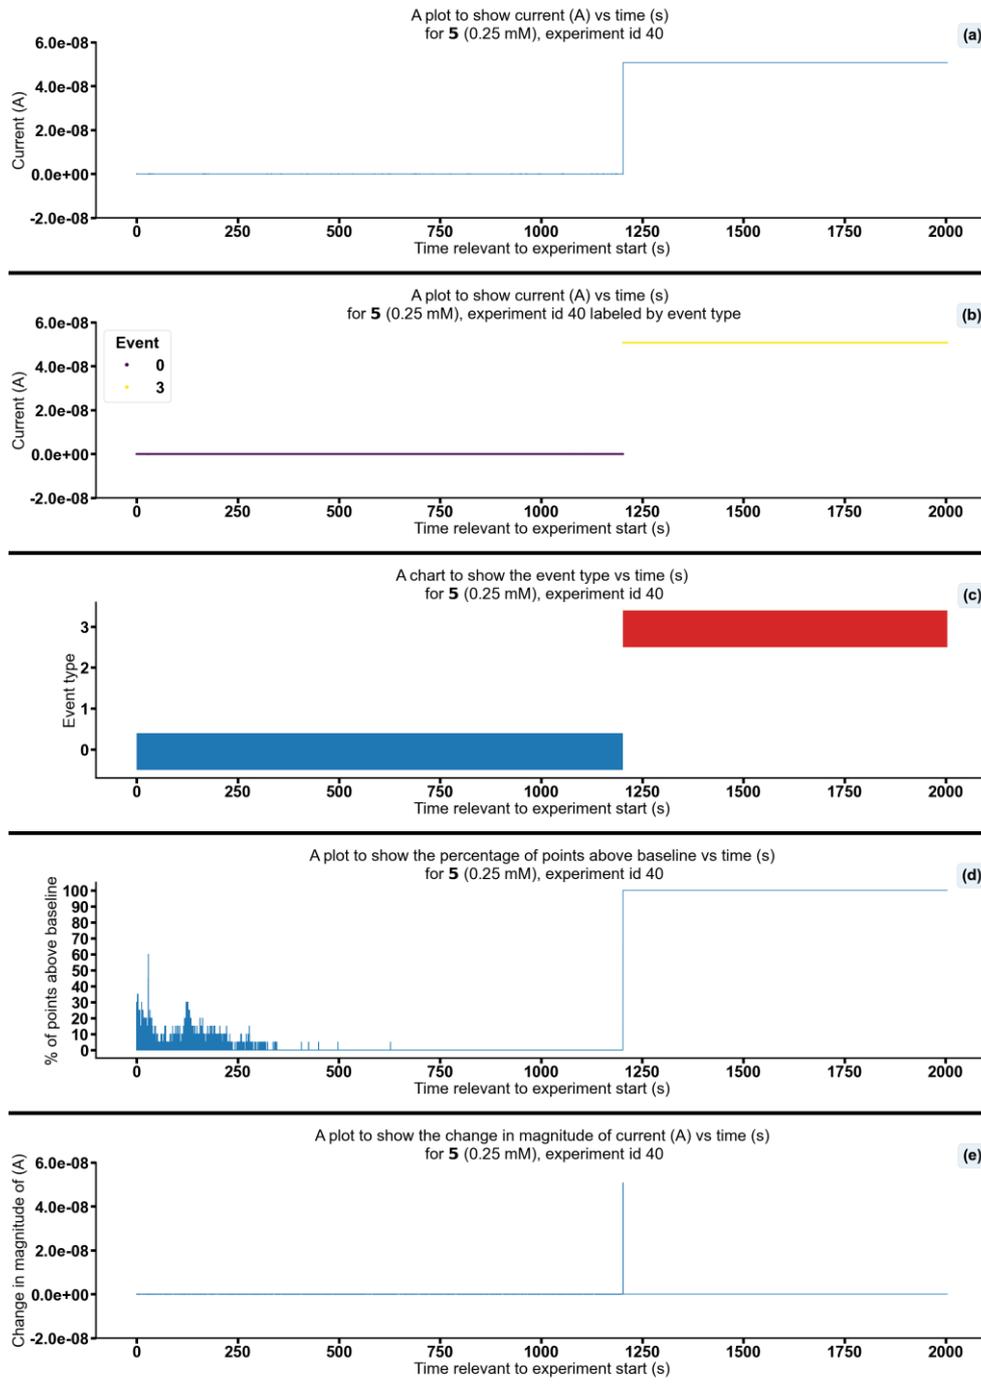

Figure S213 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 40 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

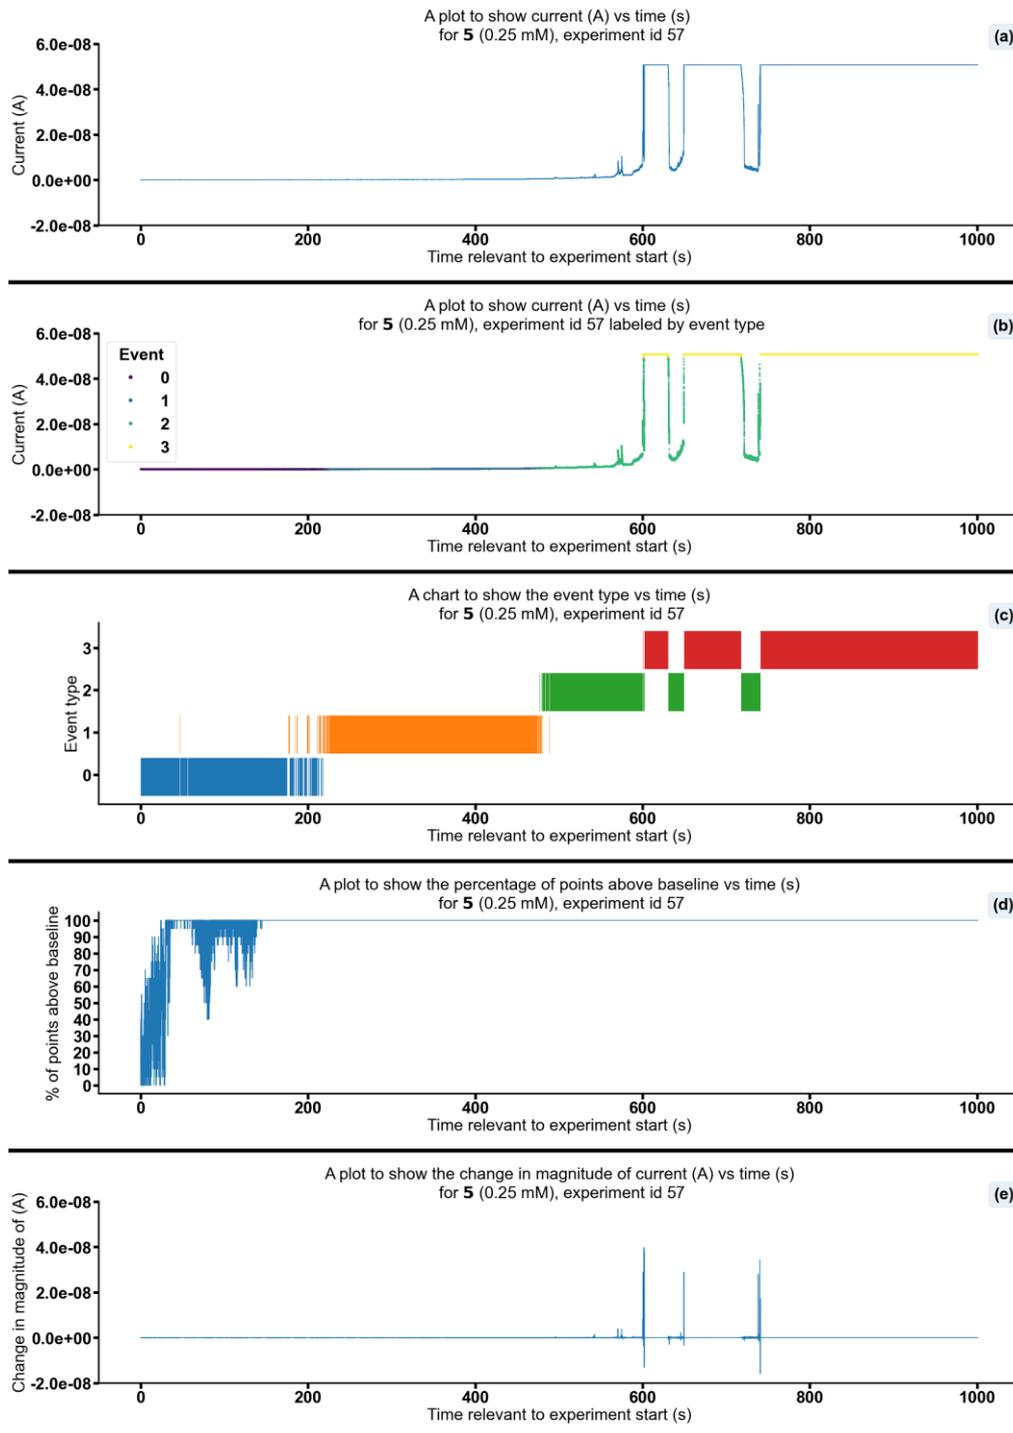

Figure S214 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 57 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 2.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

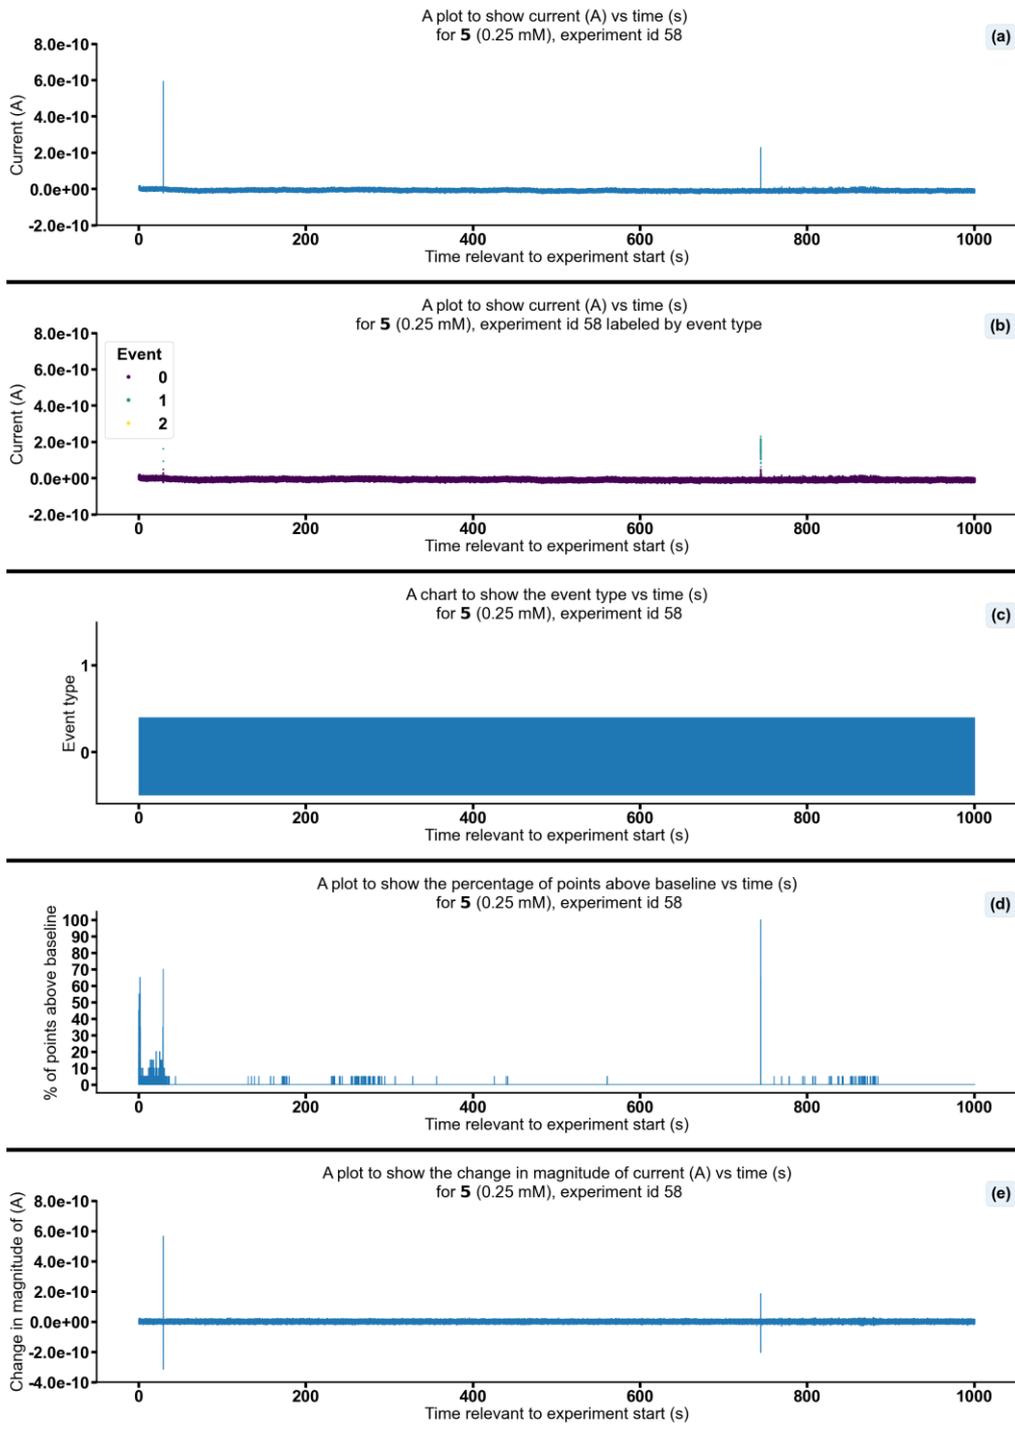

Figure S215 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 58 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $8.3 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

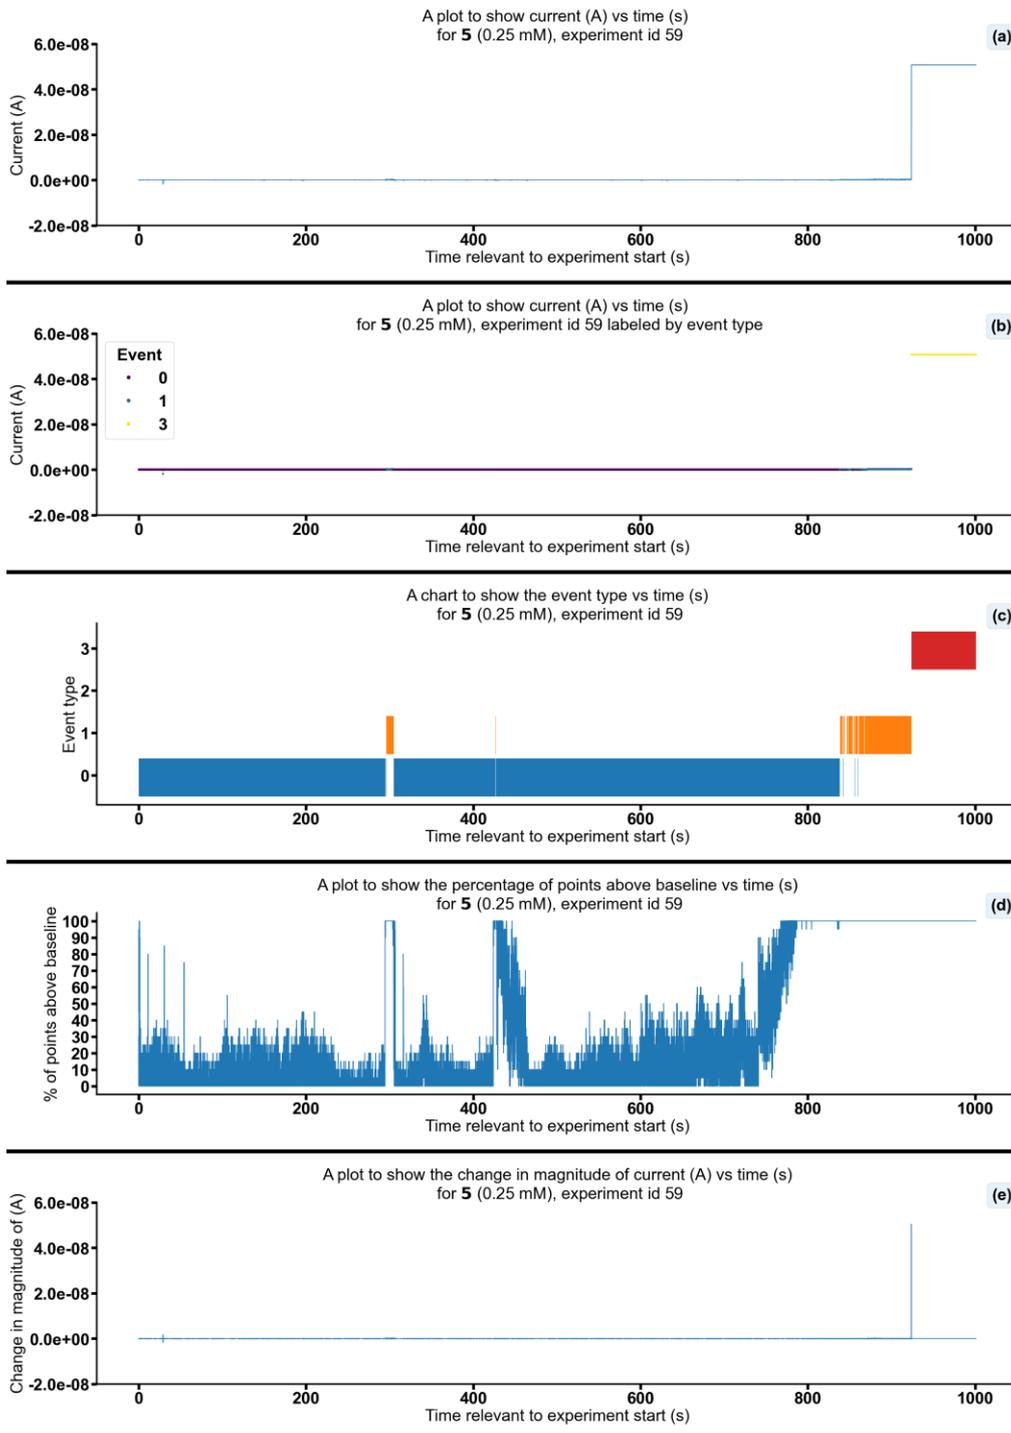

Figure S216 - Summarising the data from the patch clamp experiment for 5 (0.25 mM), experiment id 59 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold 1.6×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

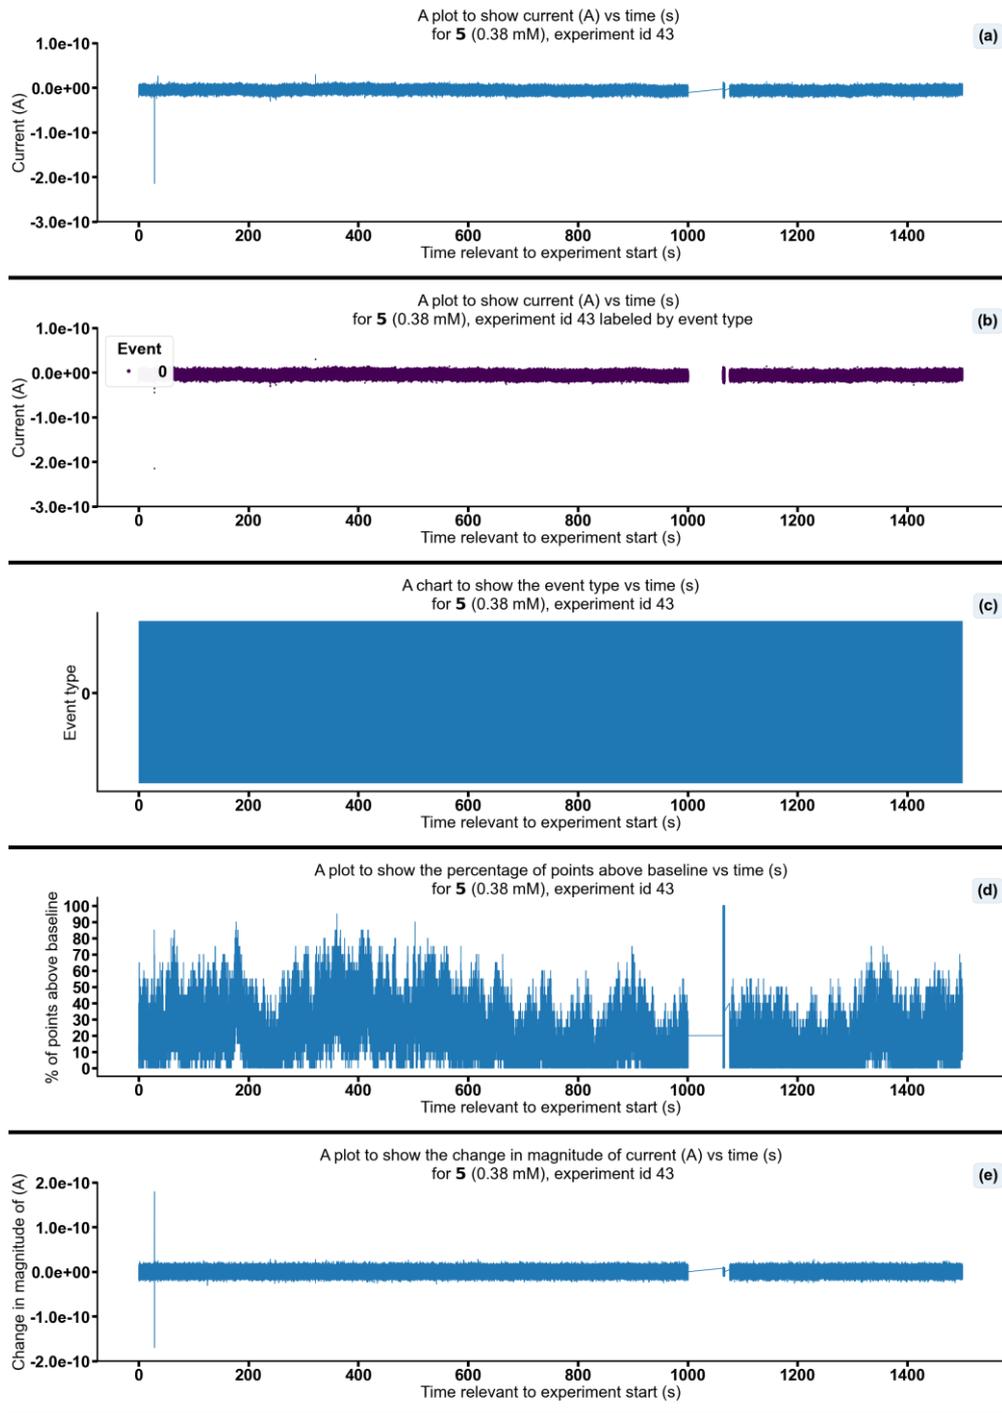

Figure S217 - Summarising the data from the patch clamp experiment for 5 (0.38 mM), experiment id 43 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -2.6×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

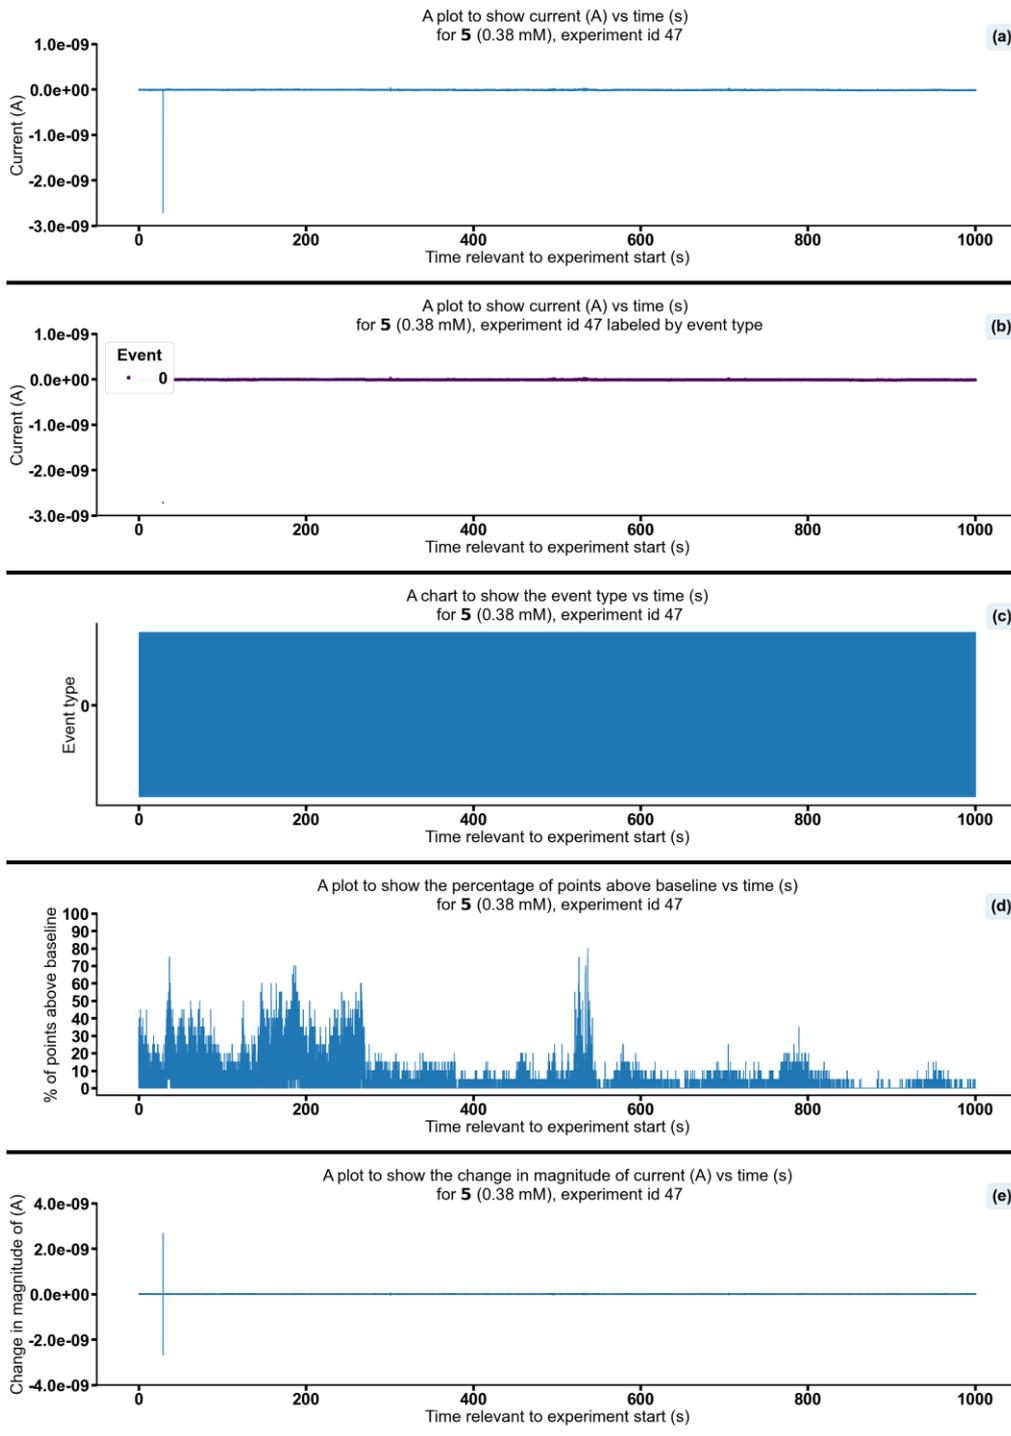

Figure S218 - Summarising the data from the patch clamp experiment for 5 (0.38 mM), experiment id 47 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -5.0×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

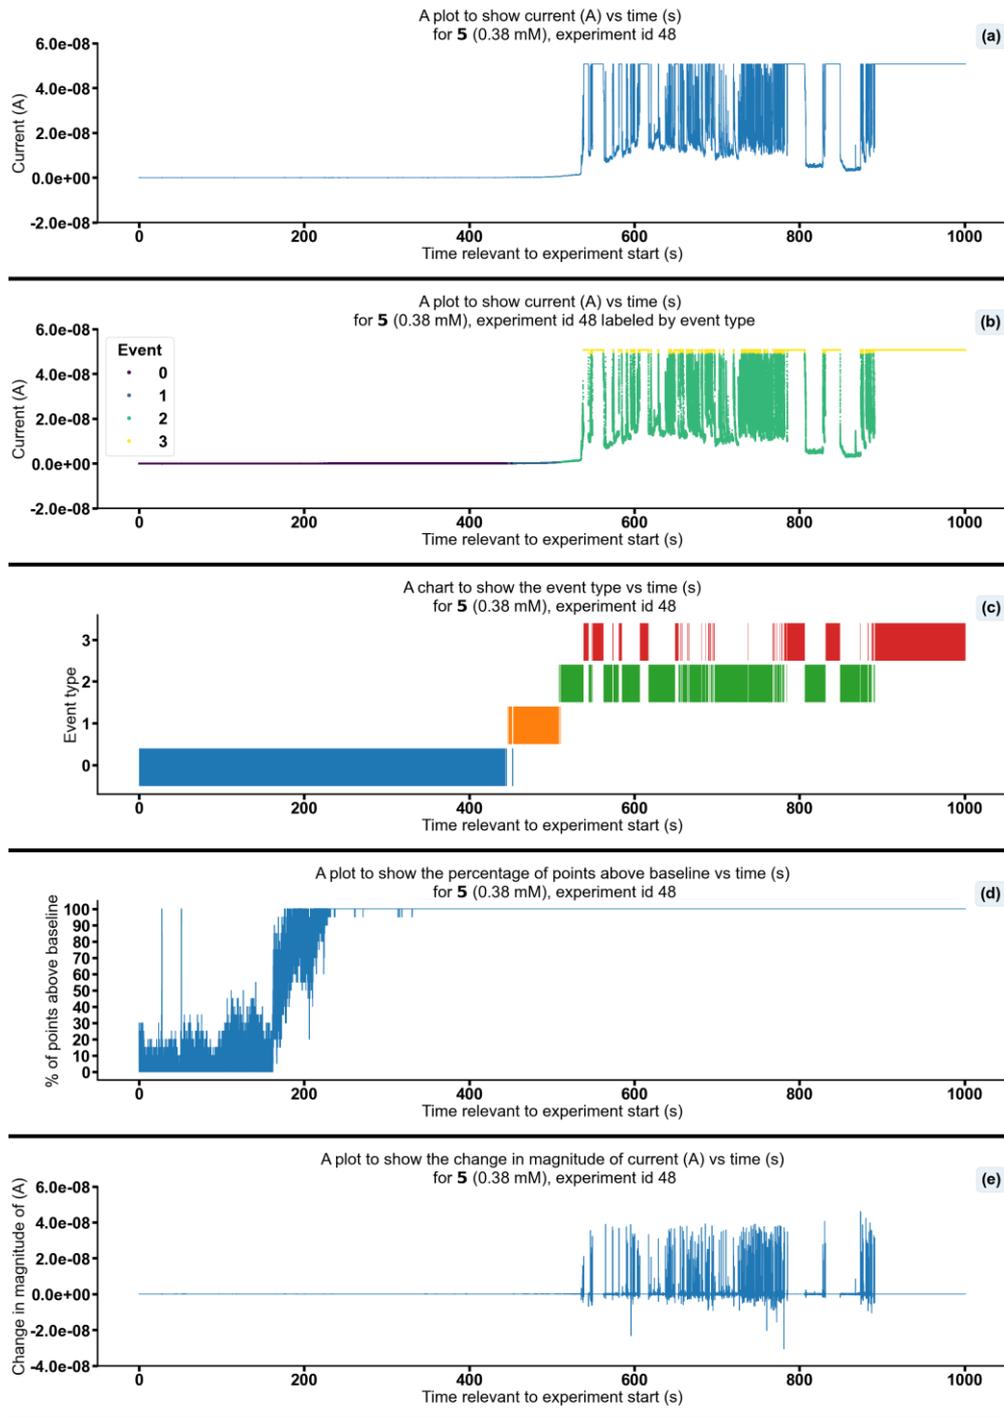

Figure S219 - Summarising the data from the patch clamp experiment for 5 (0.38 mM), experiment id 48 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -2.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

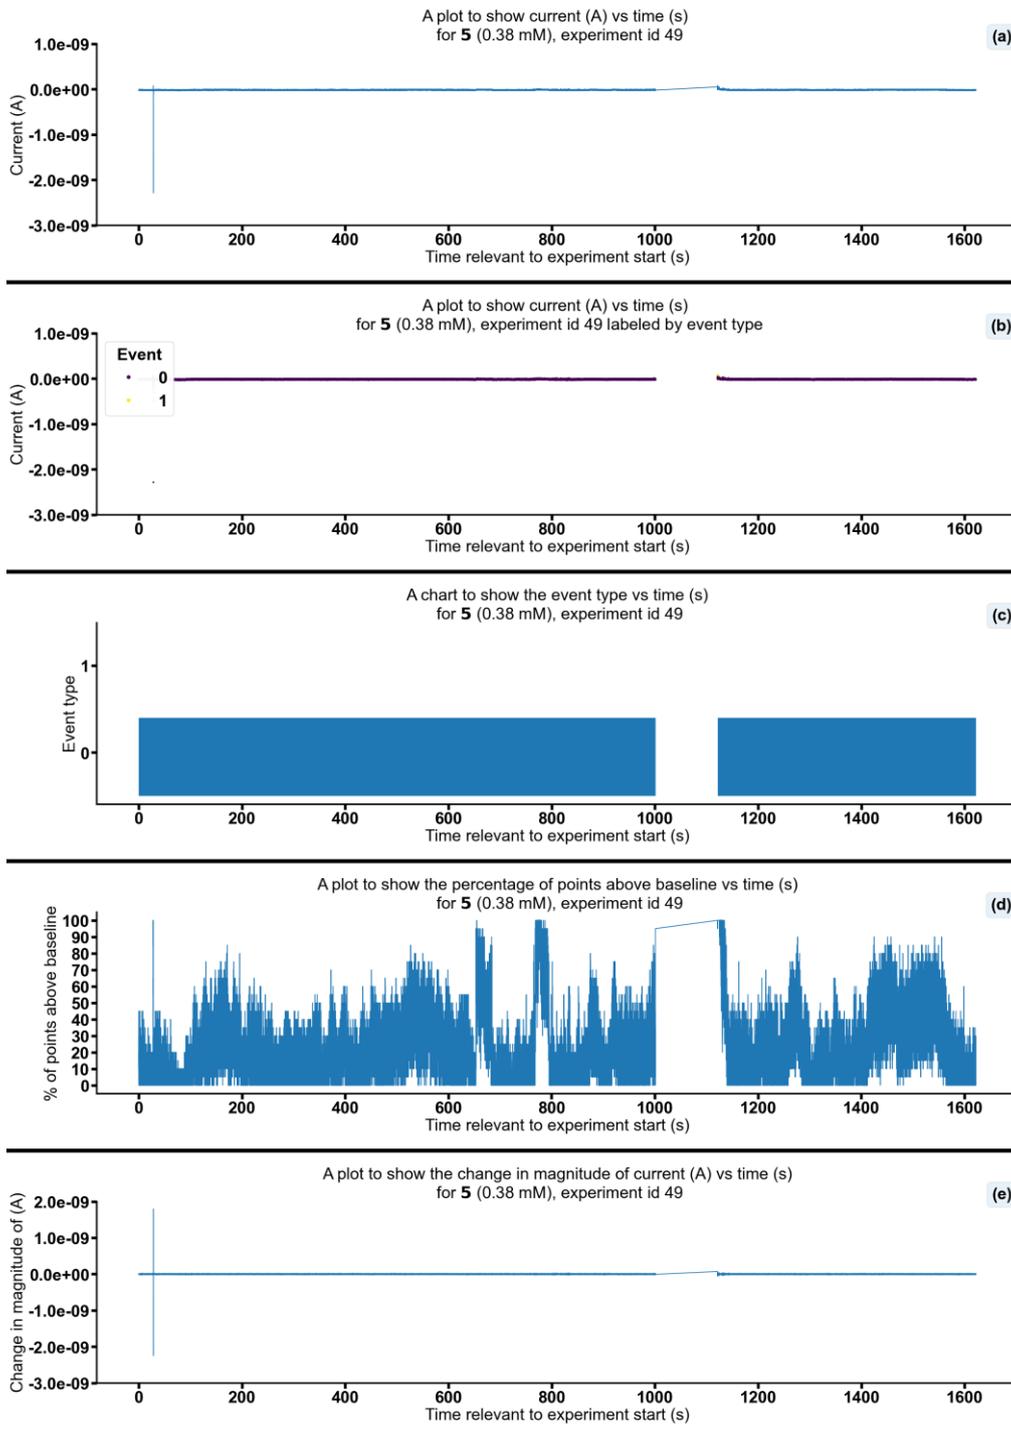

Figure S220 - Summarising the data from the patch clamp experiment for 5 (0.38 mM), experiment id 49 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.2×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

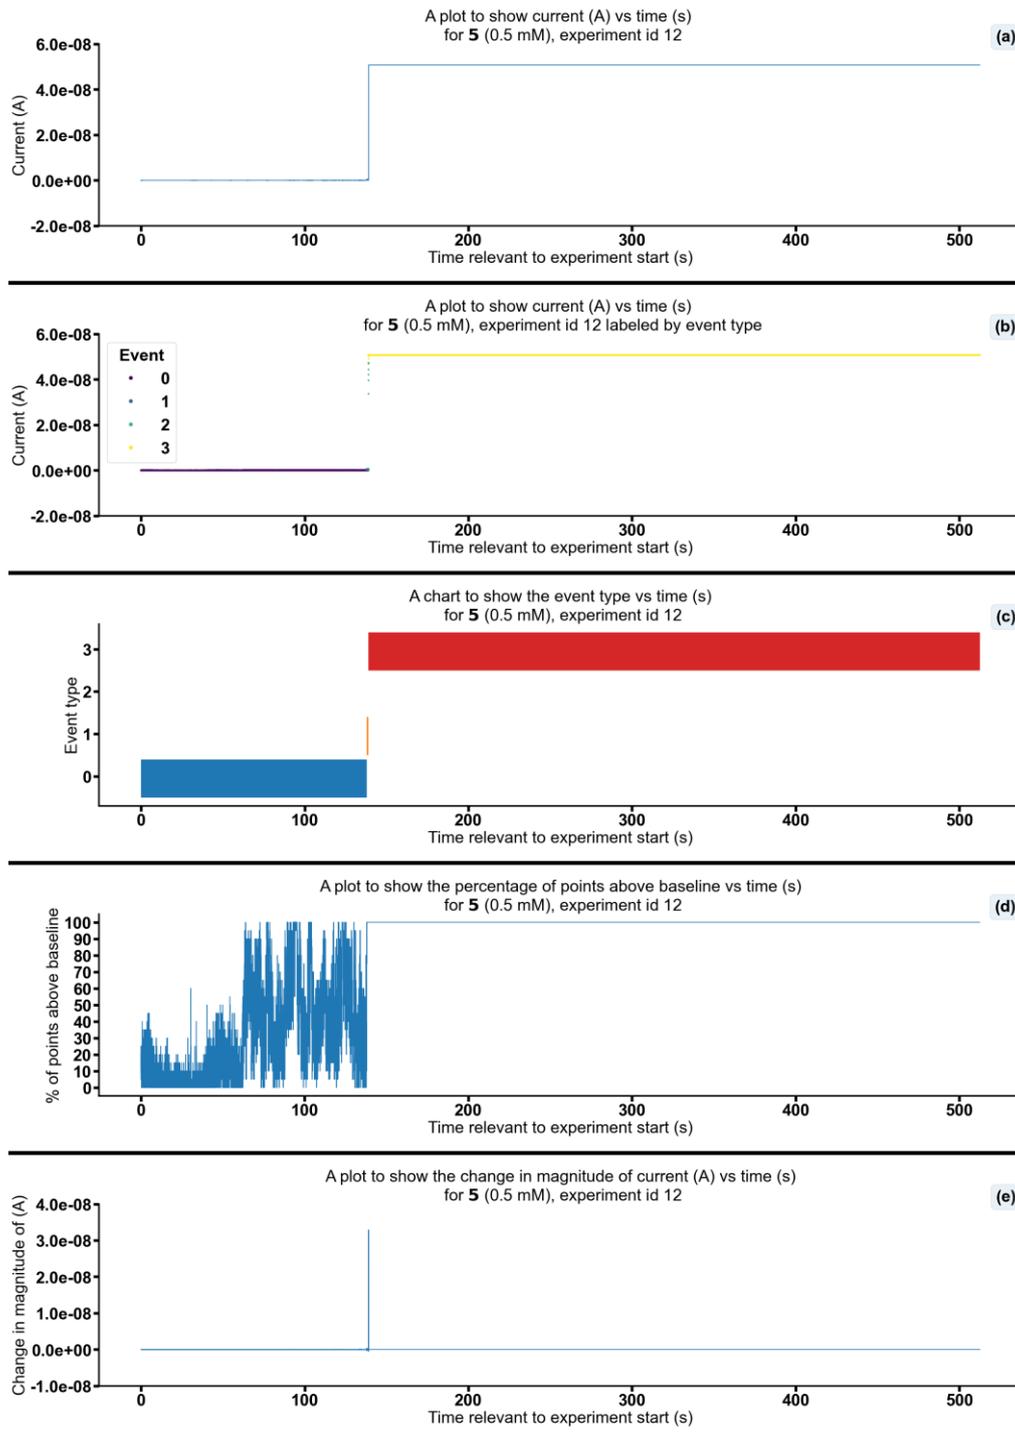

Figure S221 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 12 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -5.9×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

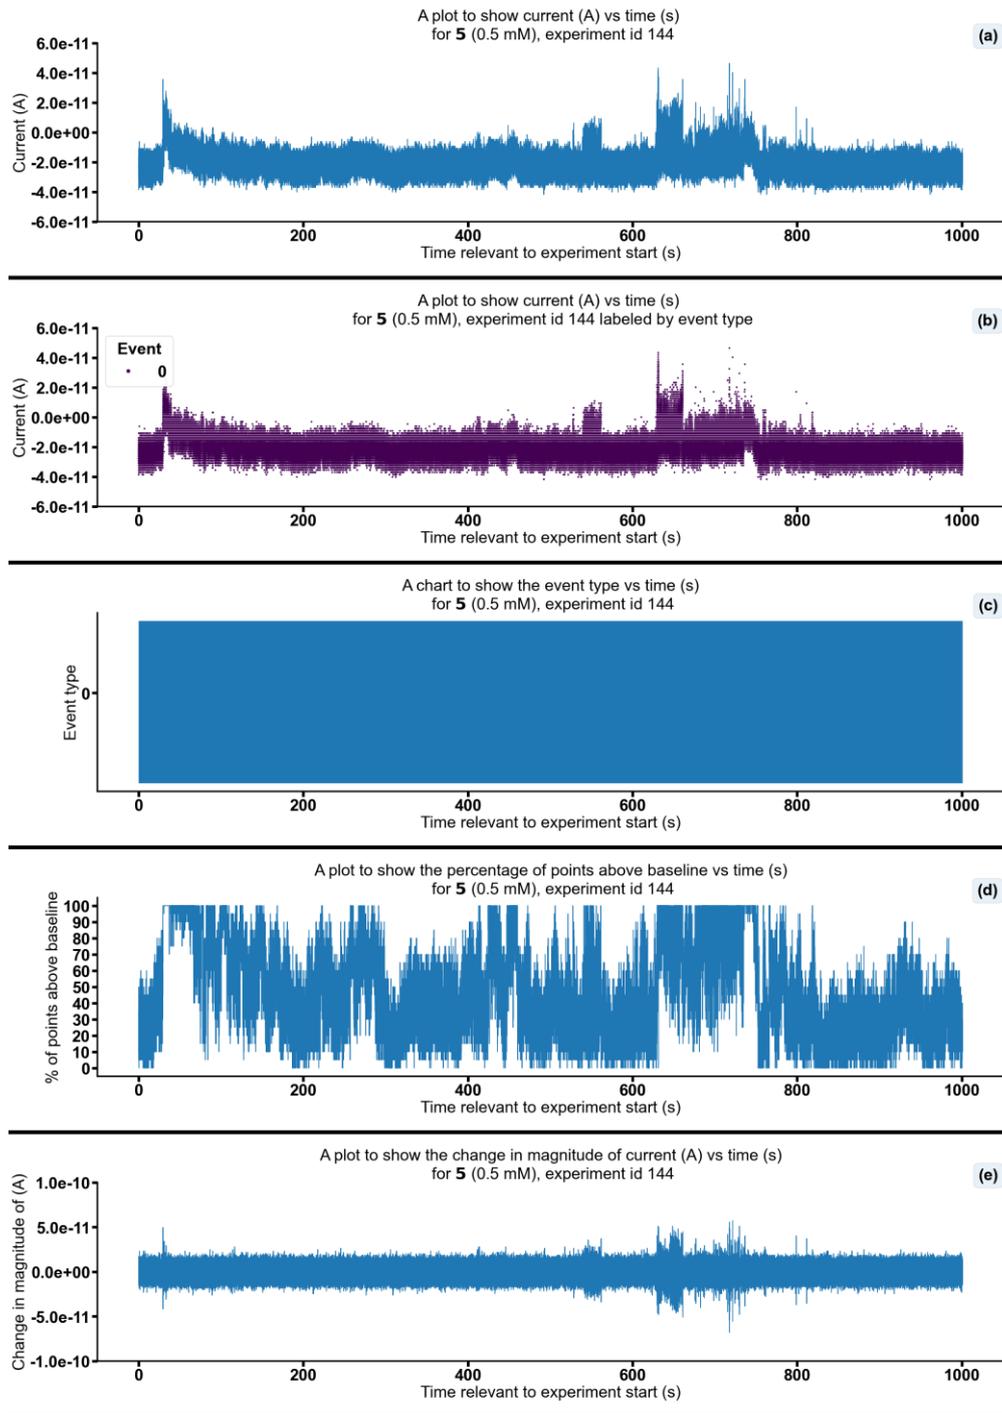

Figure S222 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 144 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.0 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

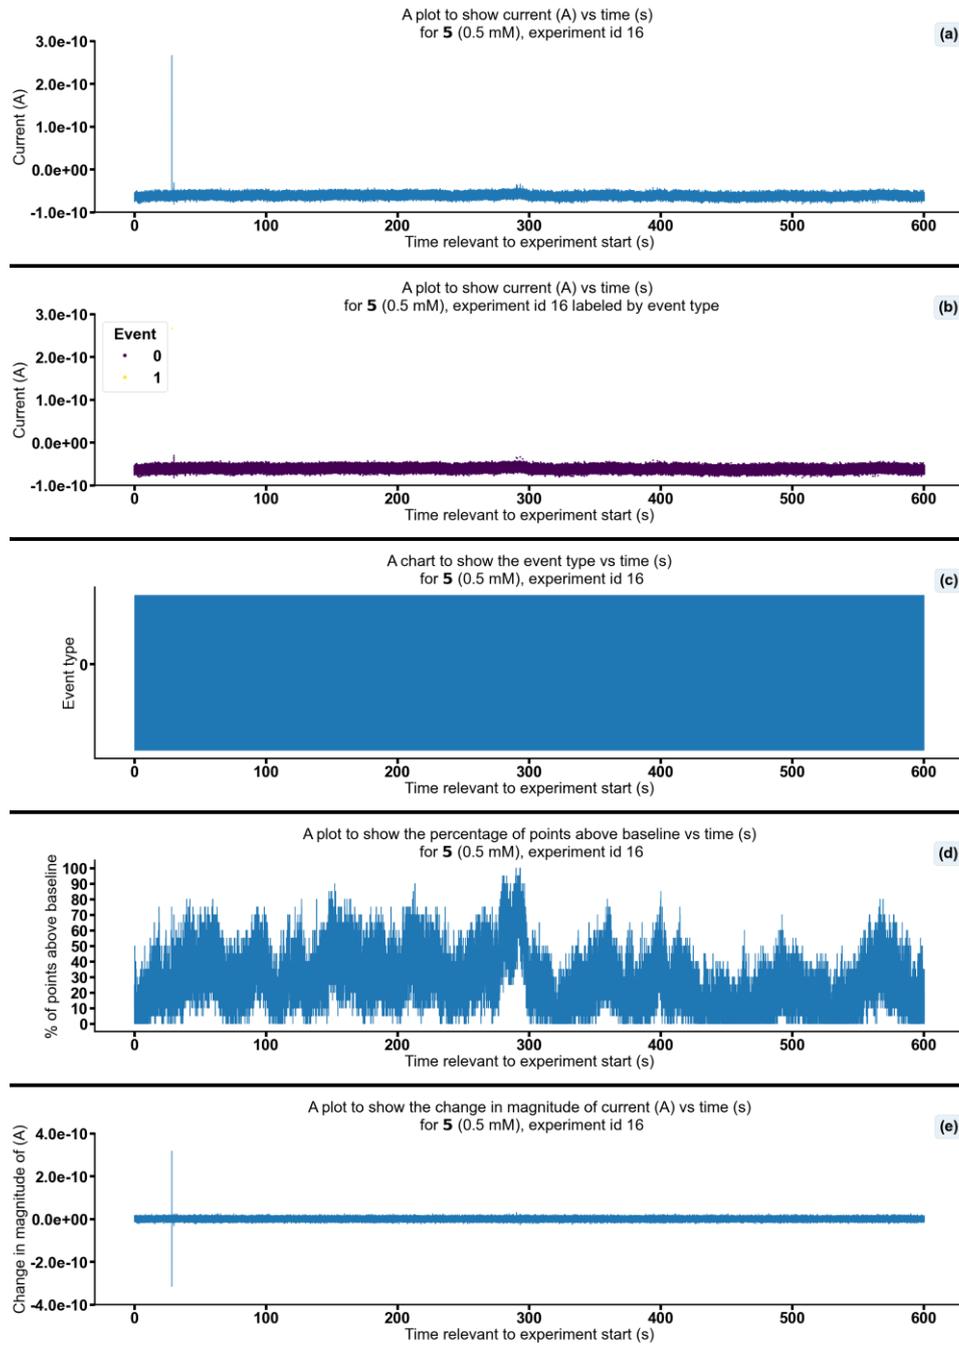

Figure S223 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 16 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -6.0×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

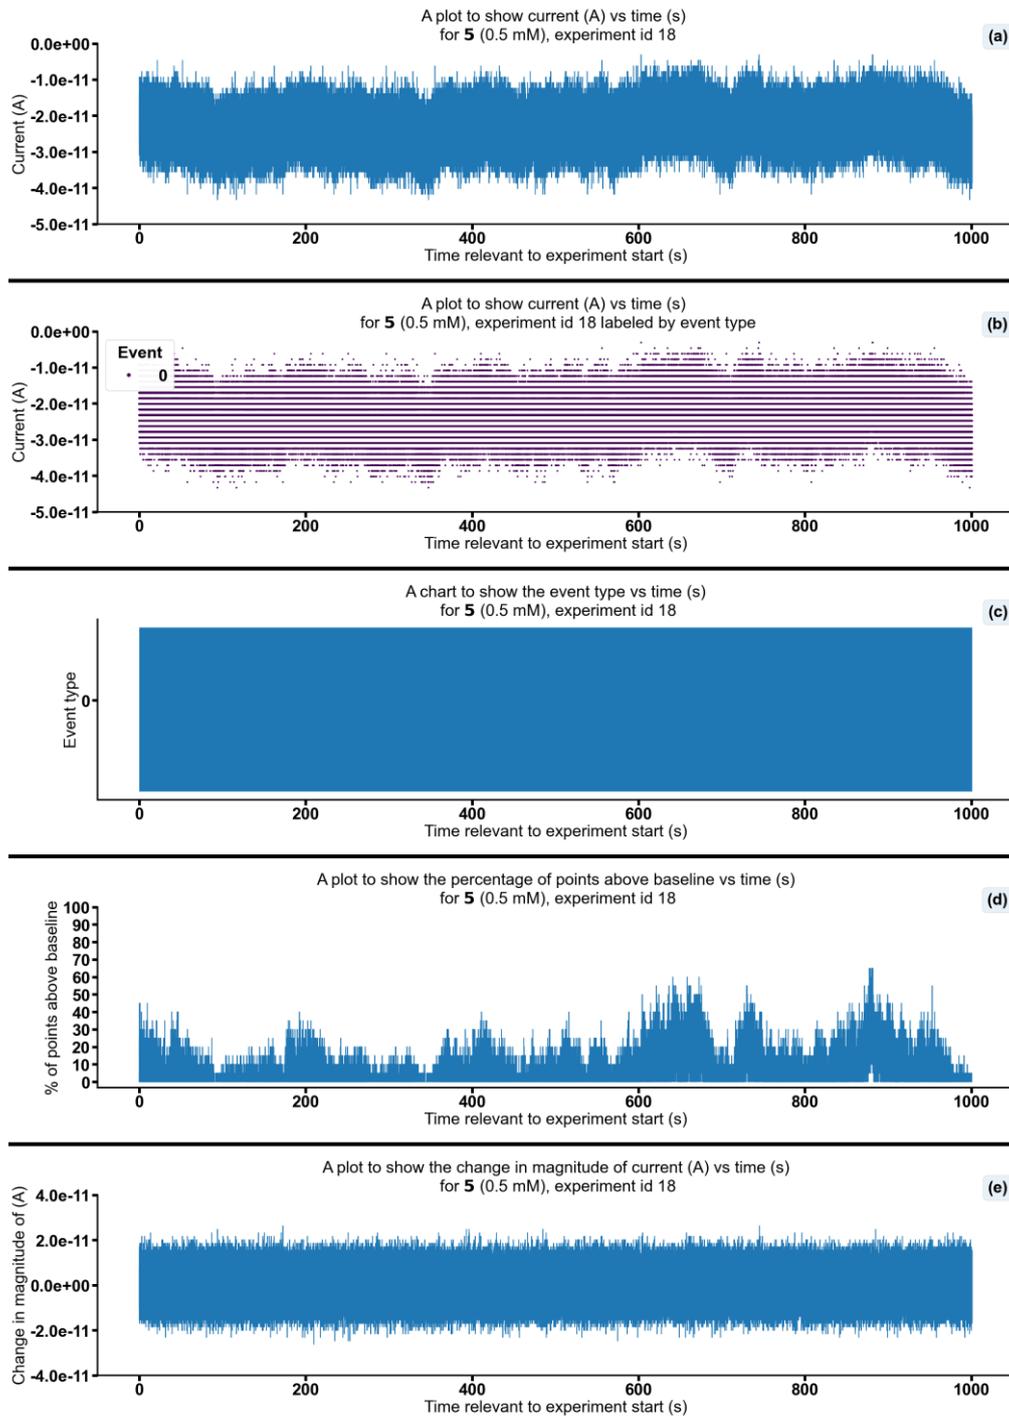

Figure S224 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 18 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00e-11$ A, 1: $5.00e-11$ A \leq Event 1 $< 5.00e-10$ A, 2: $5.00e-10$ A \leq Event 2 $< 4.90e-08$ A, 3: $4.90e-08$ A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold $-1.6e-11$ (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

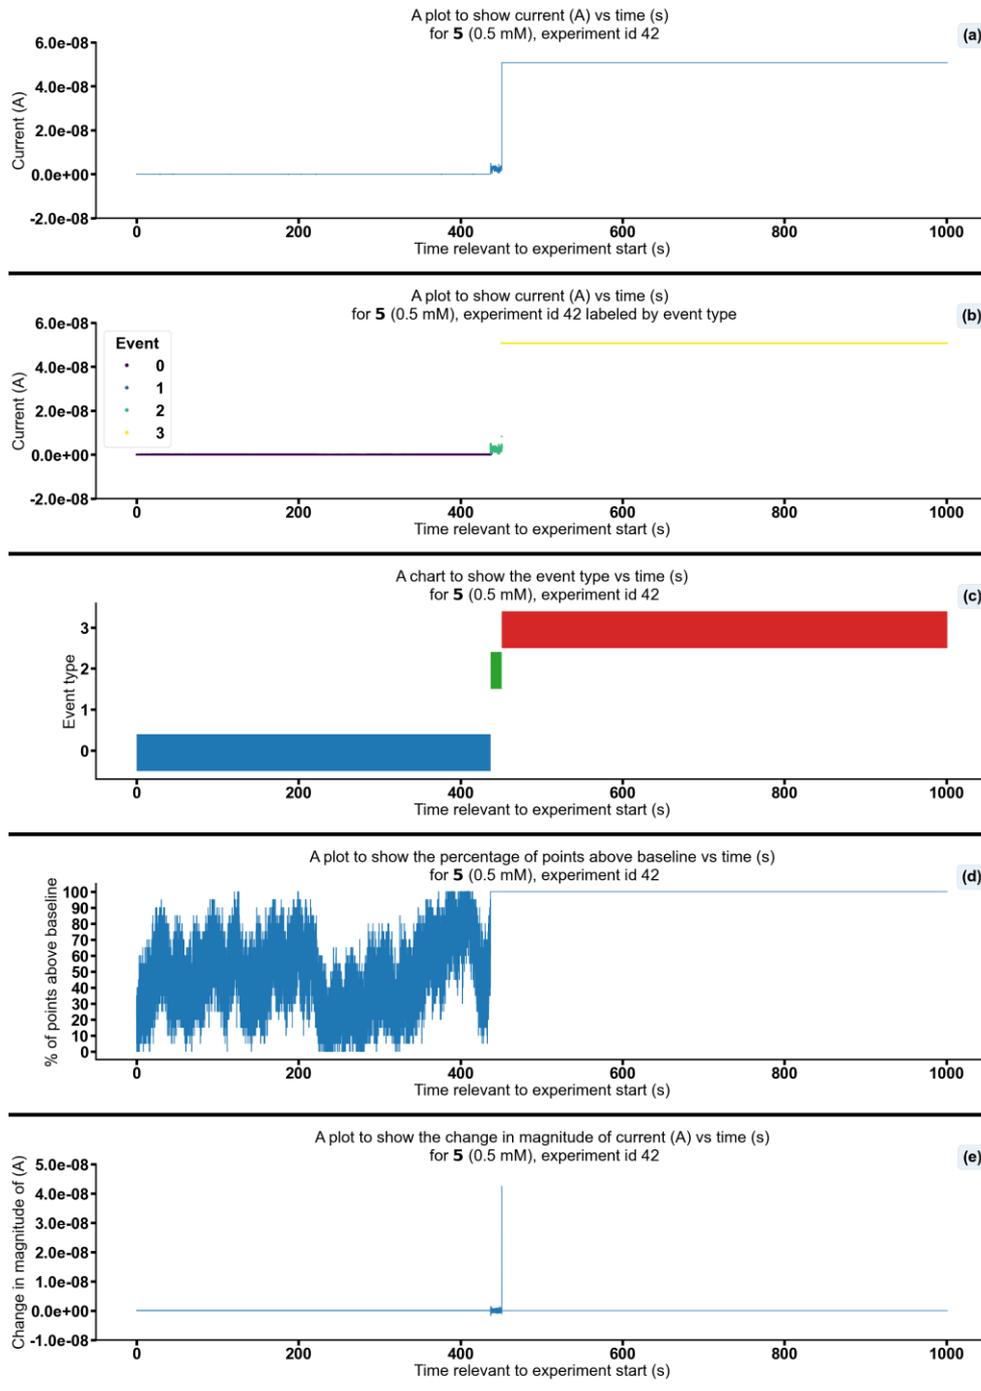

Figure S225 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 42 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.0×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

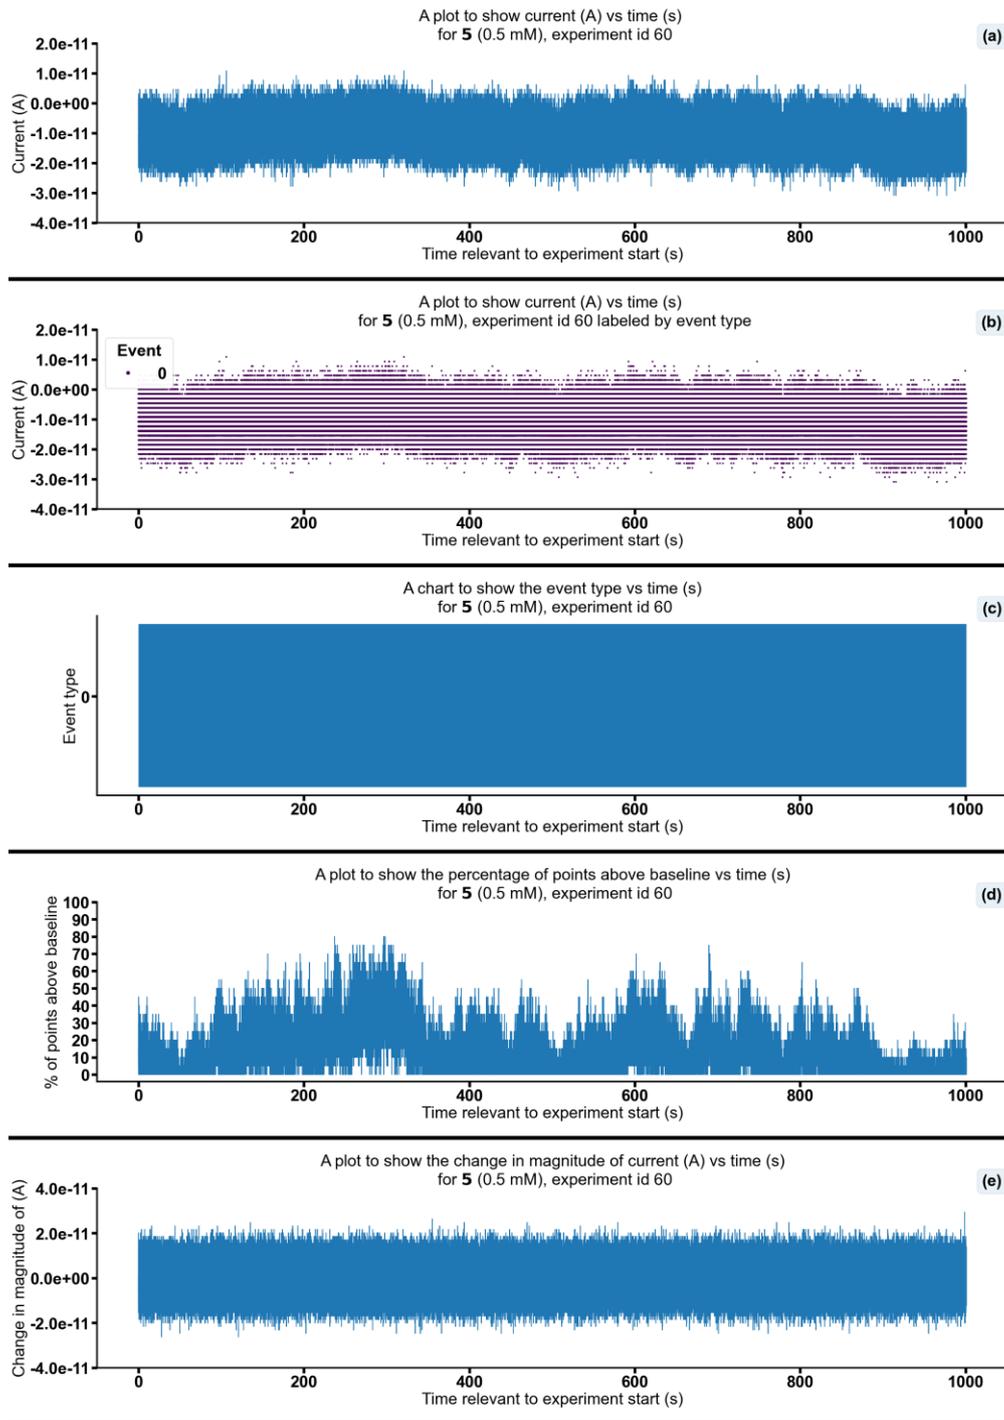

Figure S226 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 60 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -4.7×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

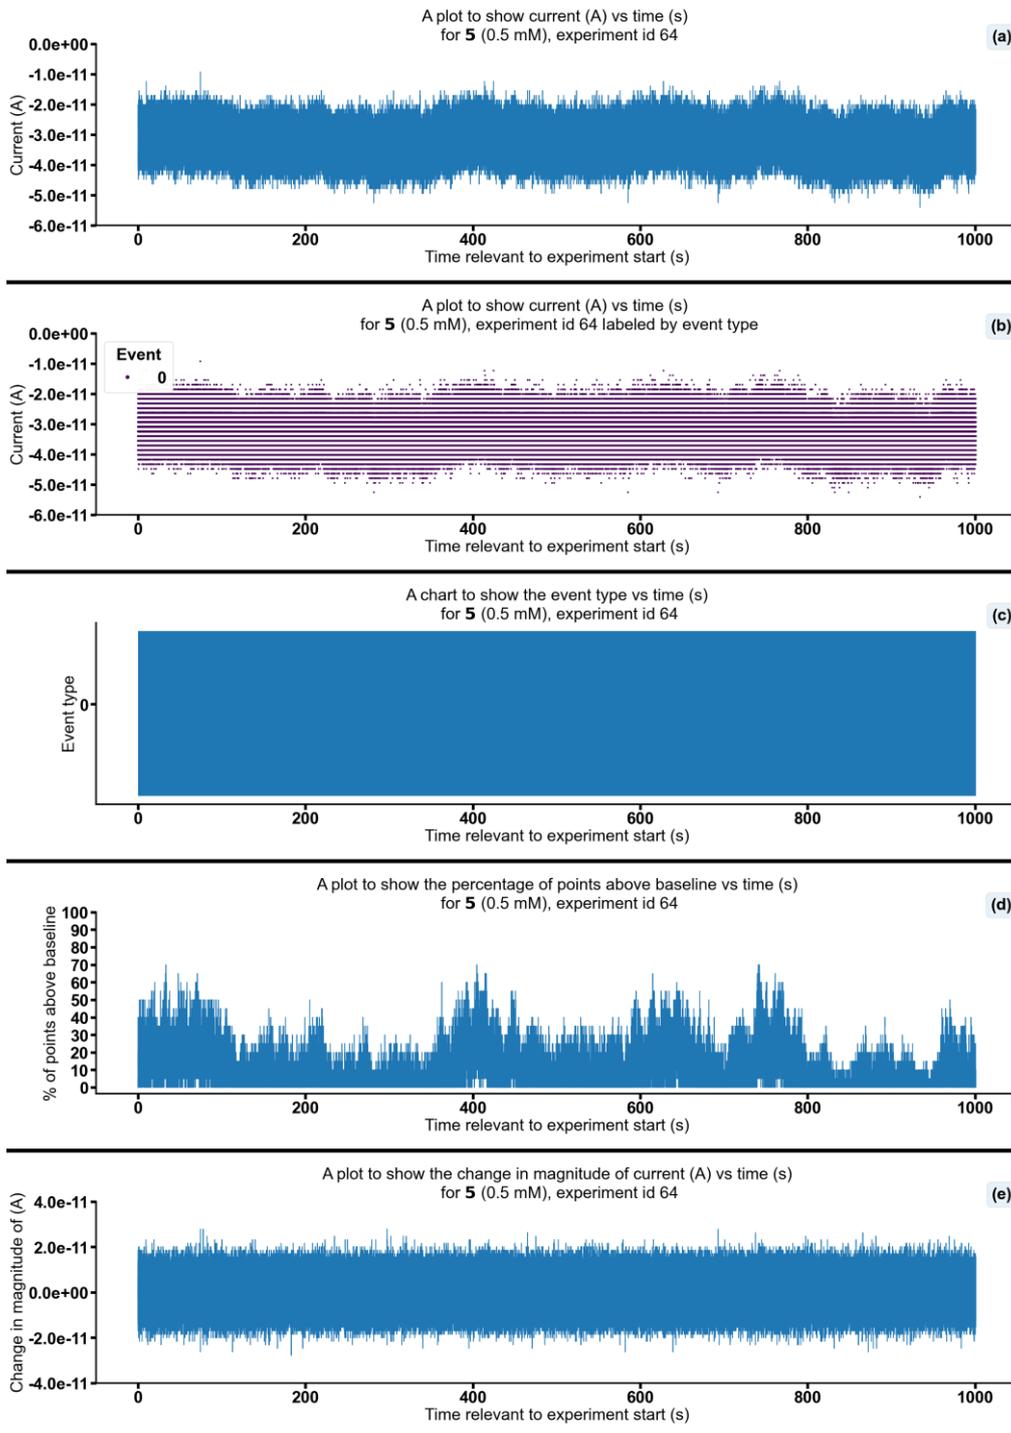

Figure S227 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 64 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00e-11$ A, 1: $5.00e-11$ A \leq Event 1 $< 5.00e-10$ A, 2: $5.00e-10$ A \leq Event 2 $< 4.90e-08$ A, 3: $4.90e-08$ A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold $-2.7e-11$ (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

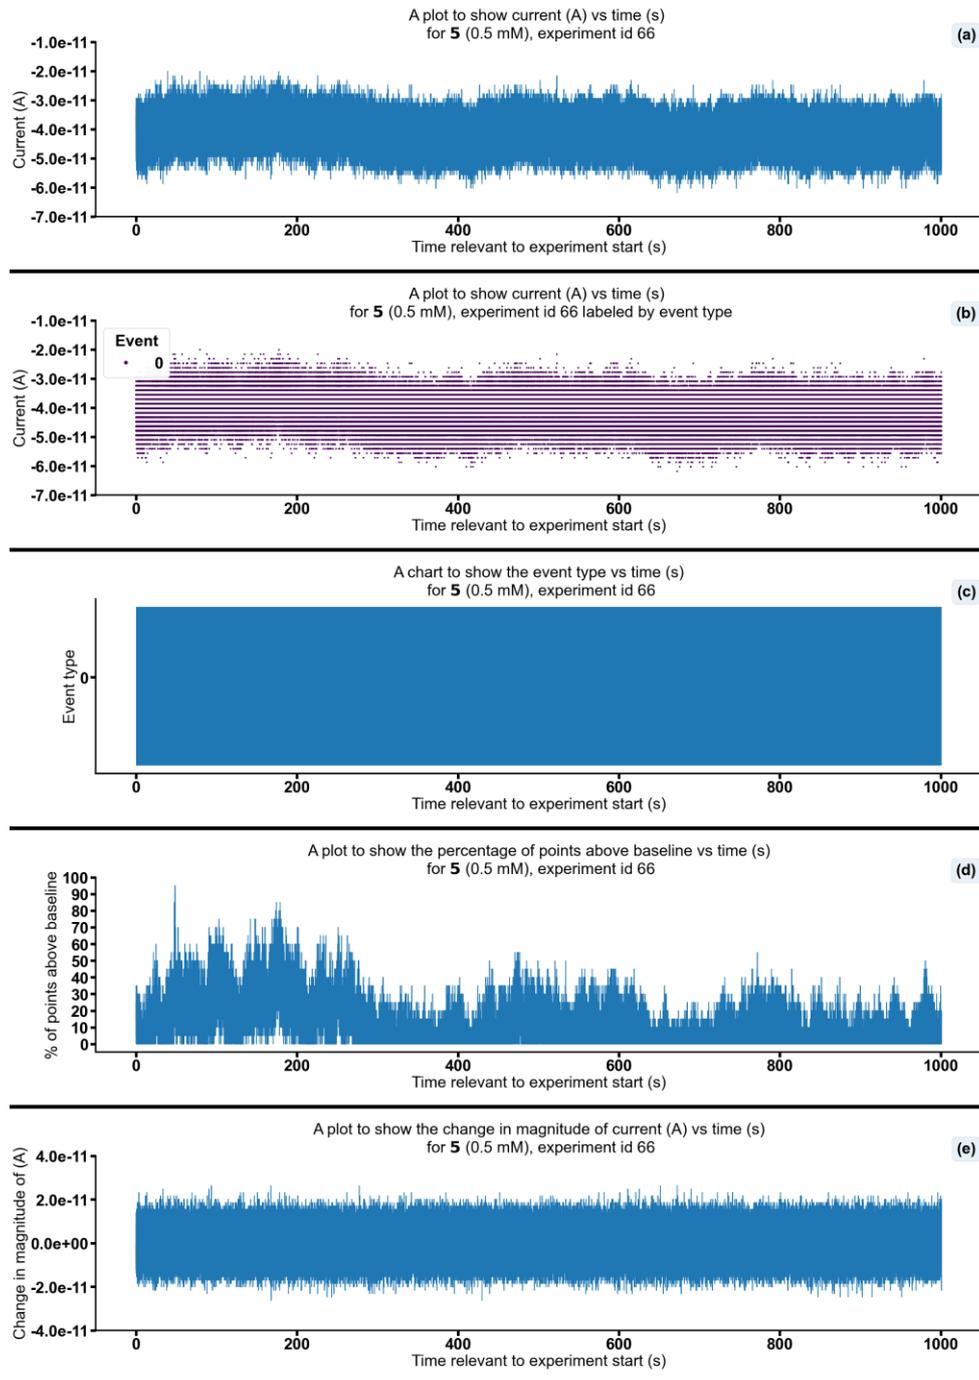

Figure S228 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 66 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.6×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

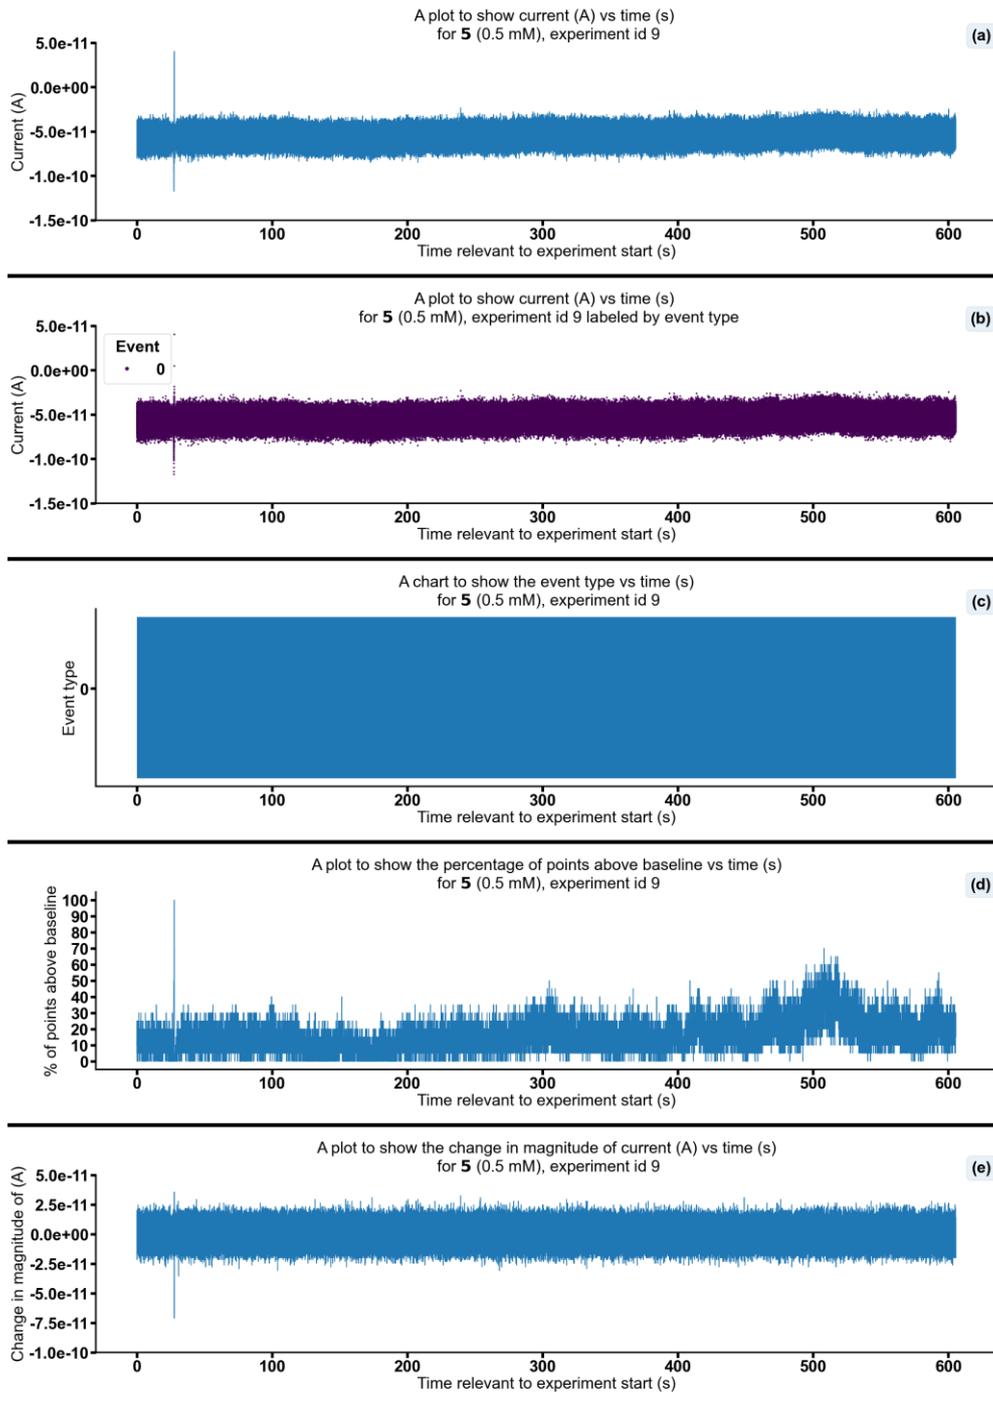

Figure S229 - Summarising the data from the patch clamp experiment for 5 (0.5 mM), experiment id 9 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -4.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

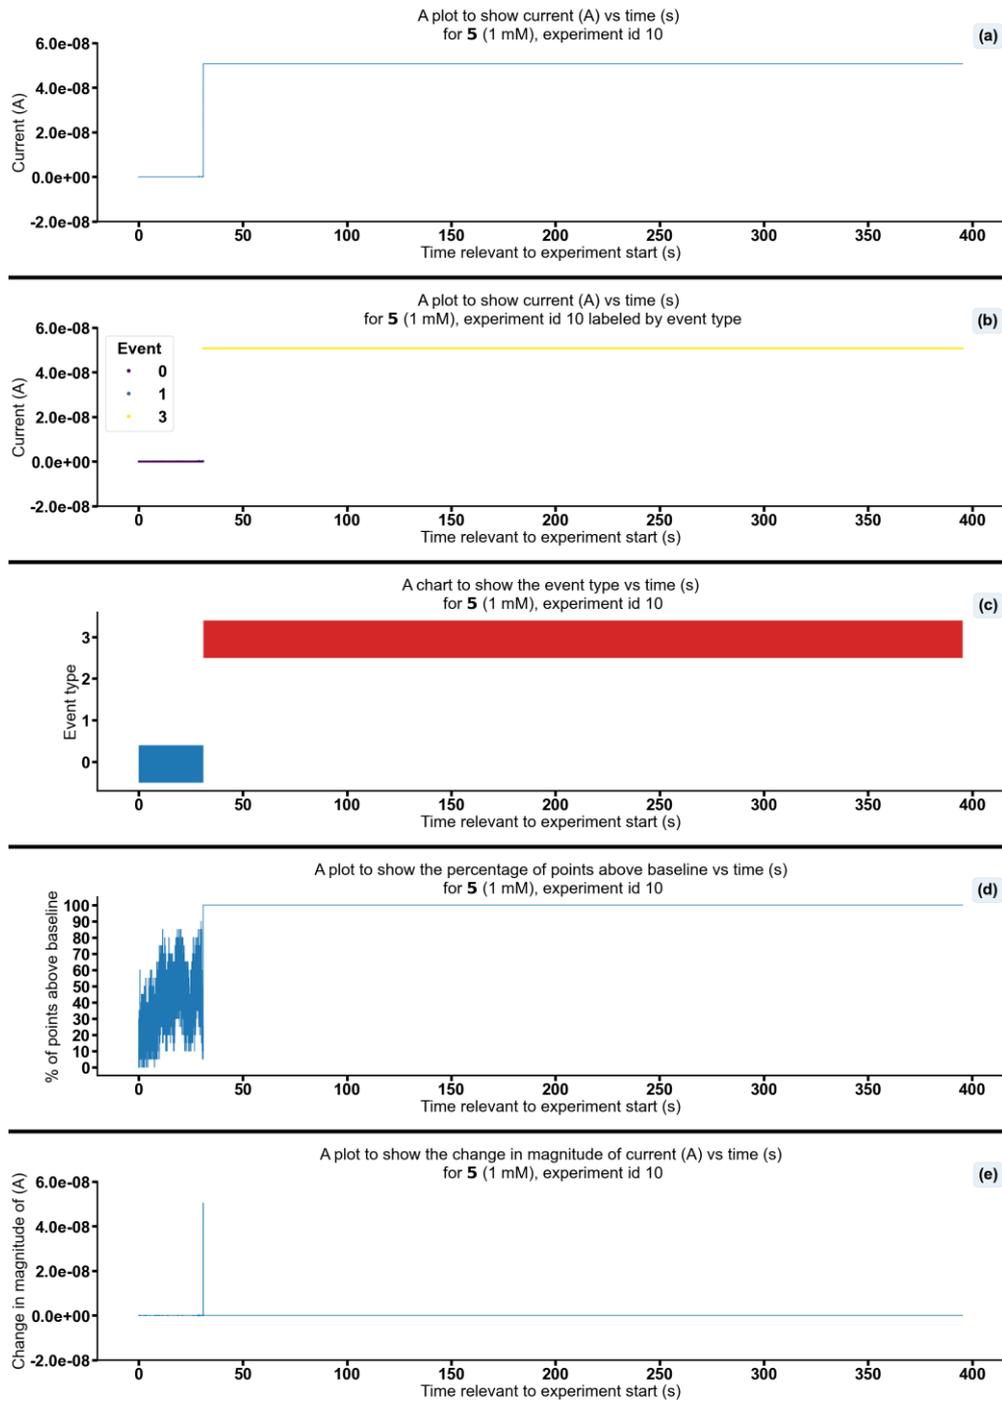

Figure S230 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 10 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

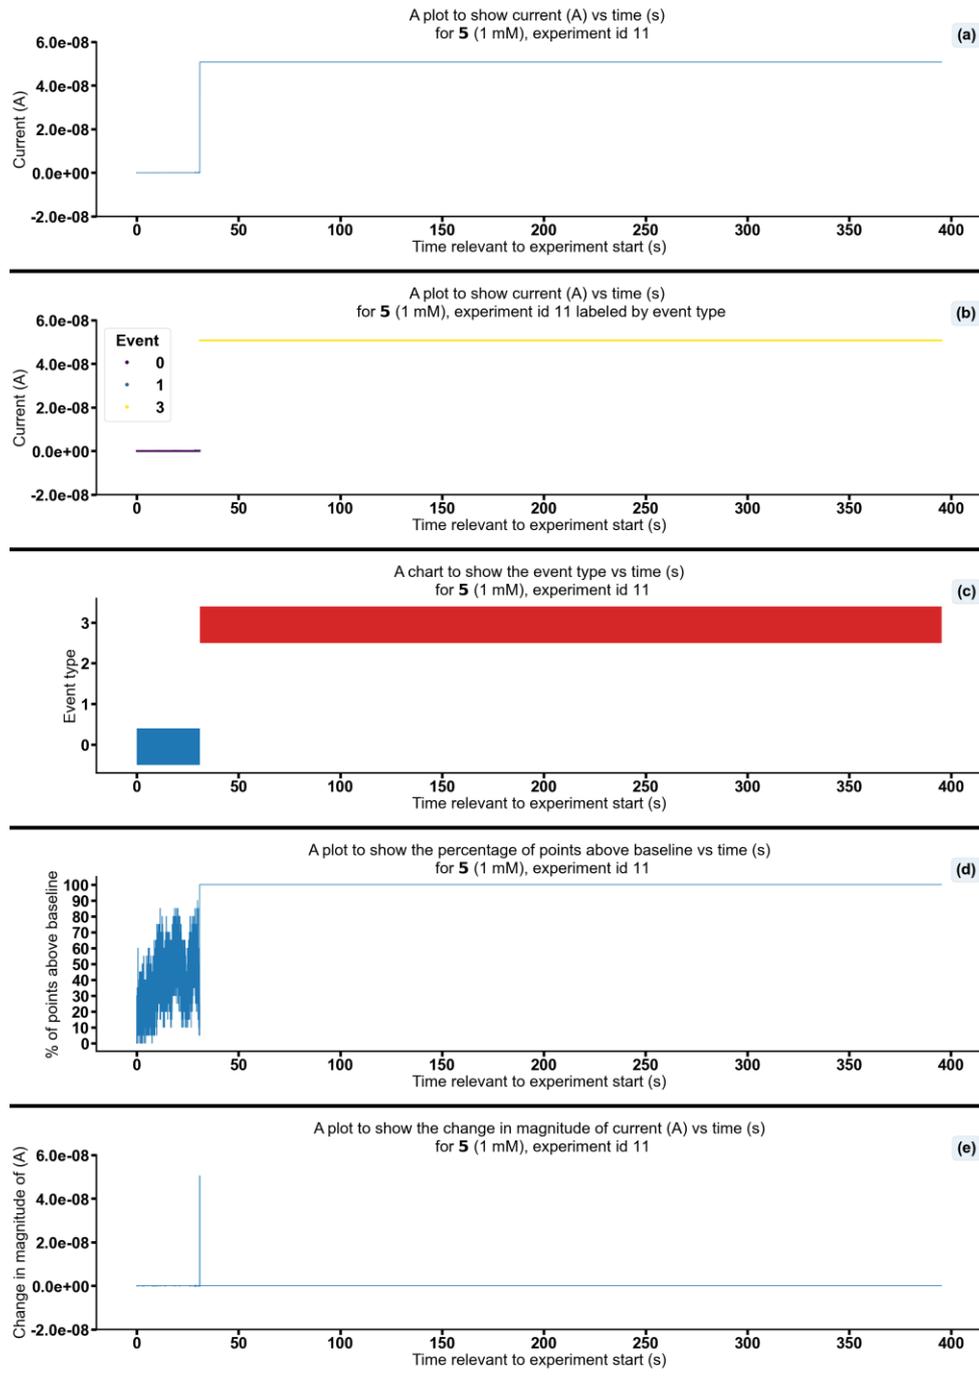

Figure S231 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 11 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

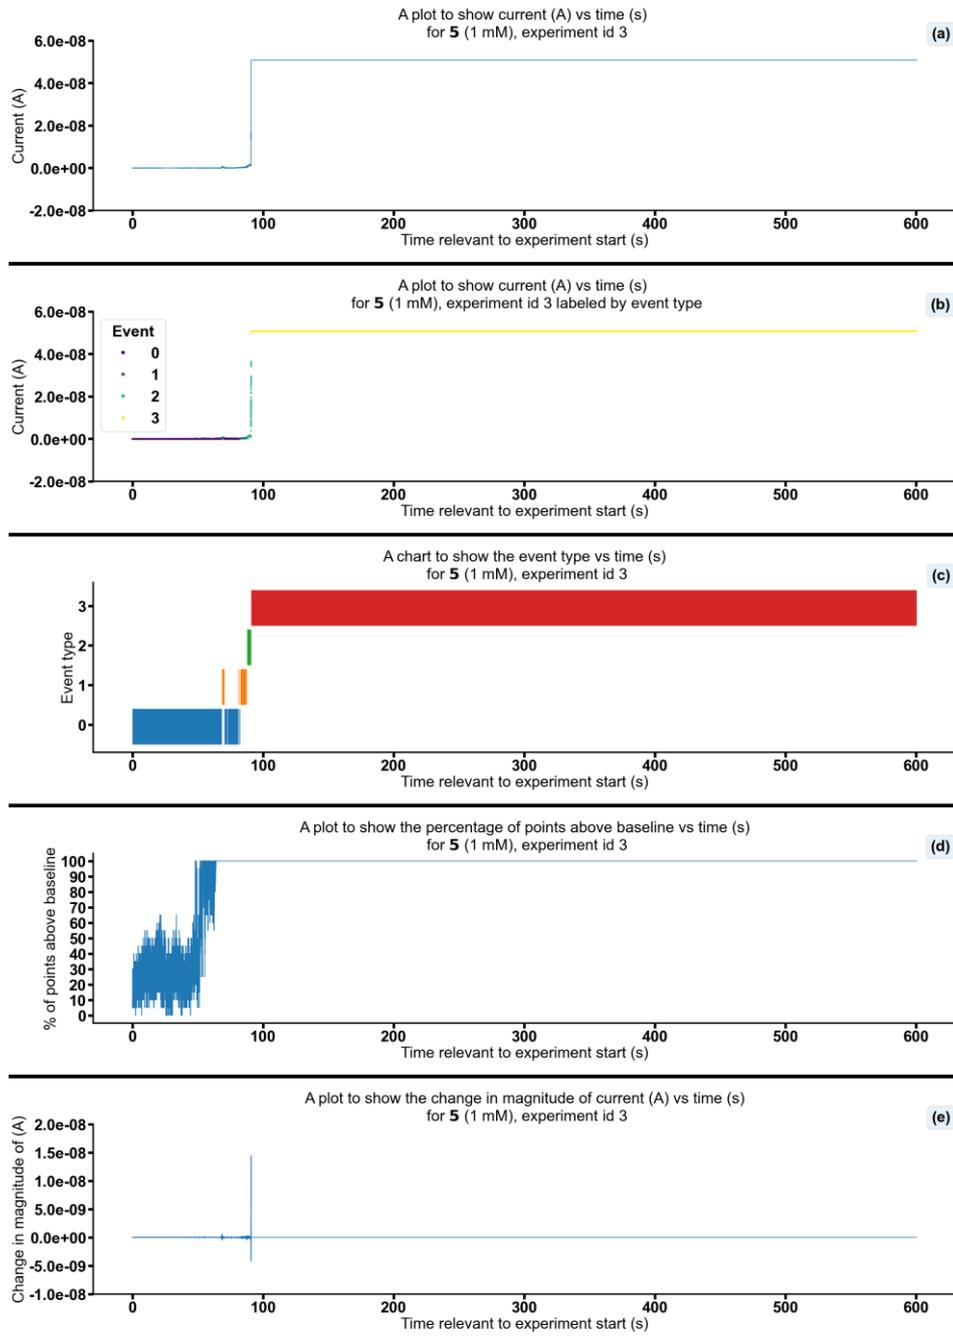

Figure S232 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 3 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.7 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

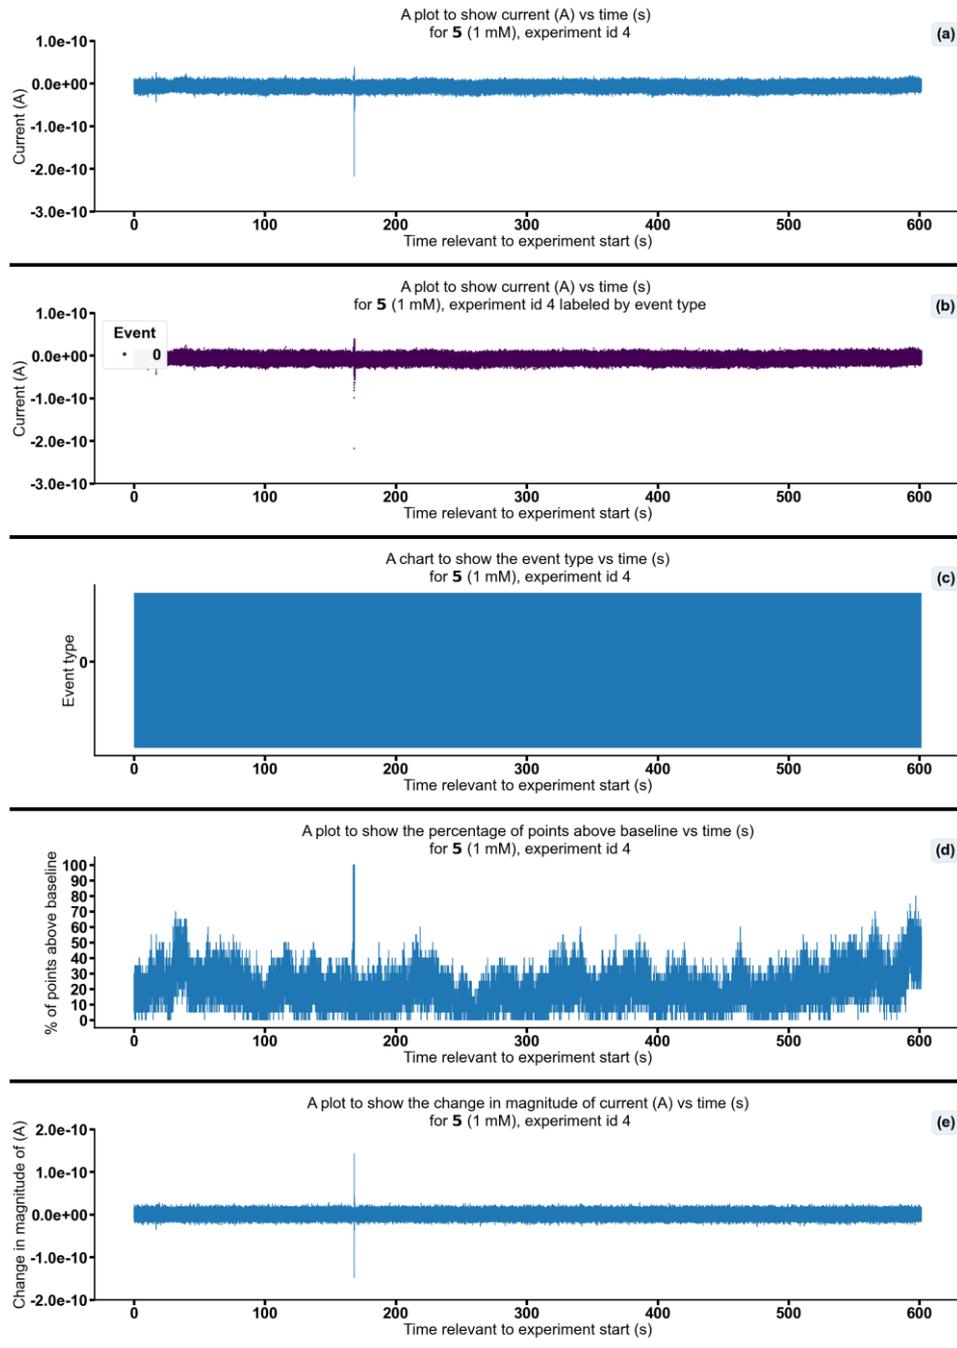

Figure S233 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 4 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.1 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

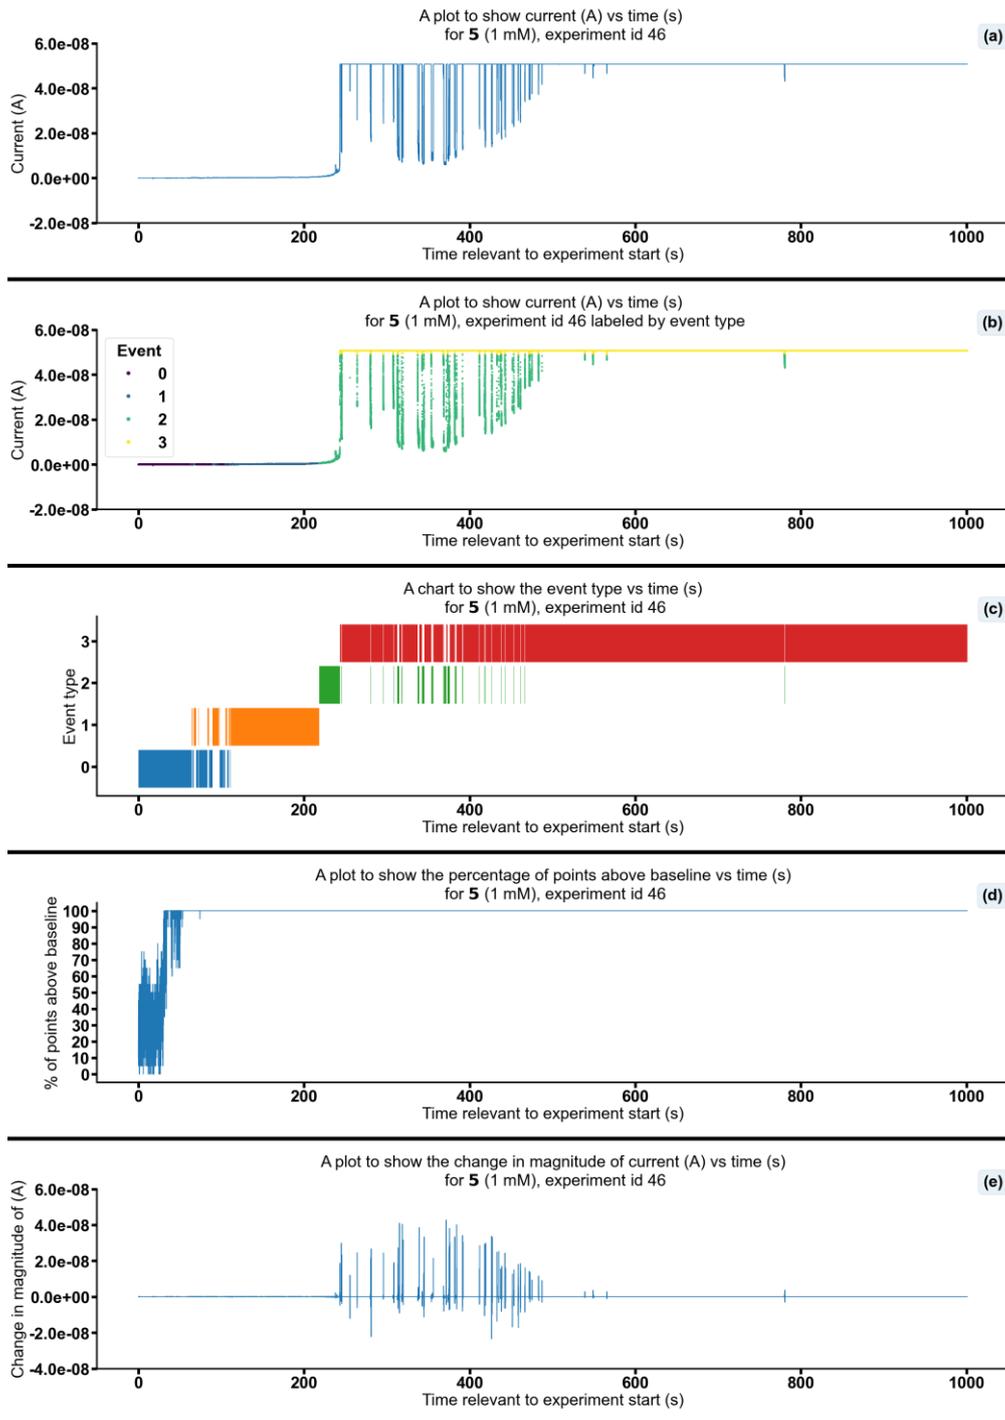

Figure S234 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 46 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -6.3×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

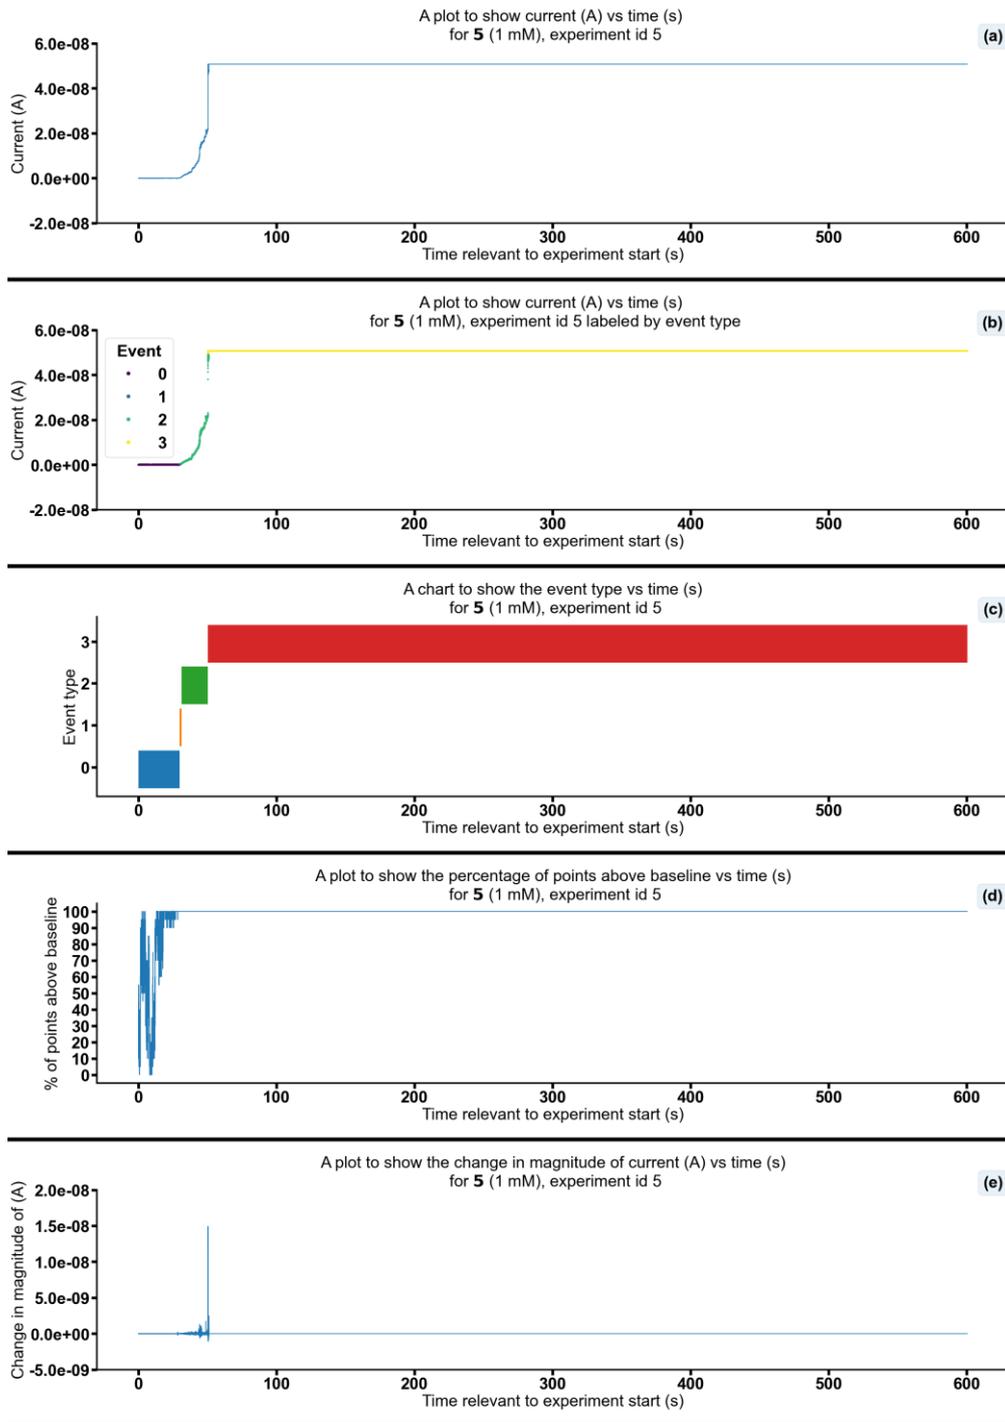

Figure S235 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 5 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-4.7 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

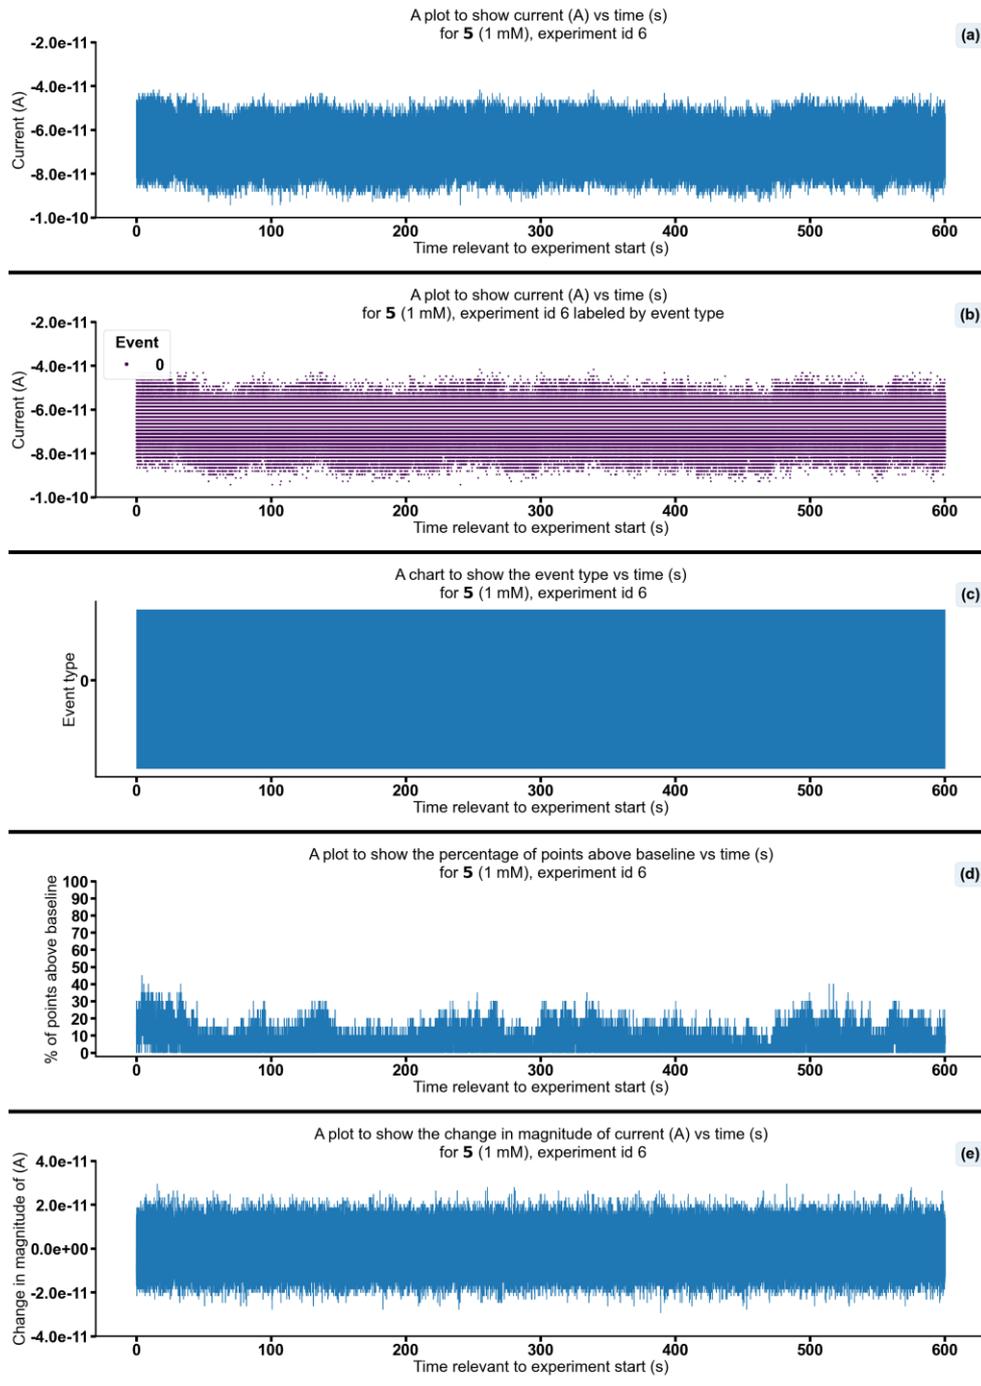

Figure S236 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 6 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-5.8 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

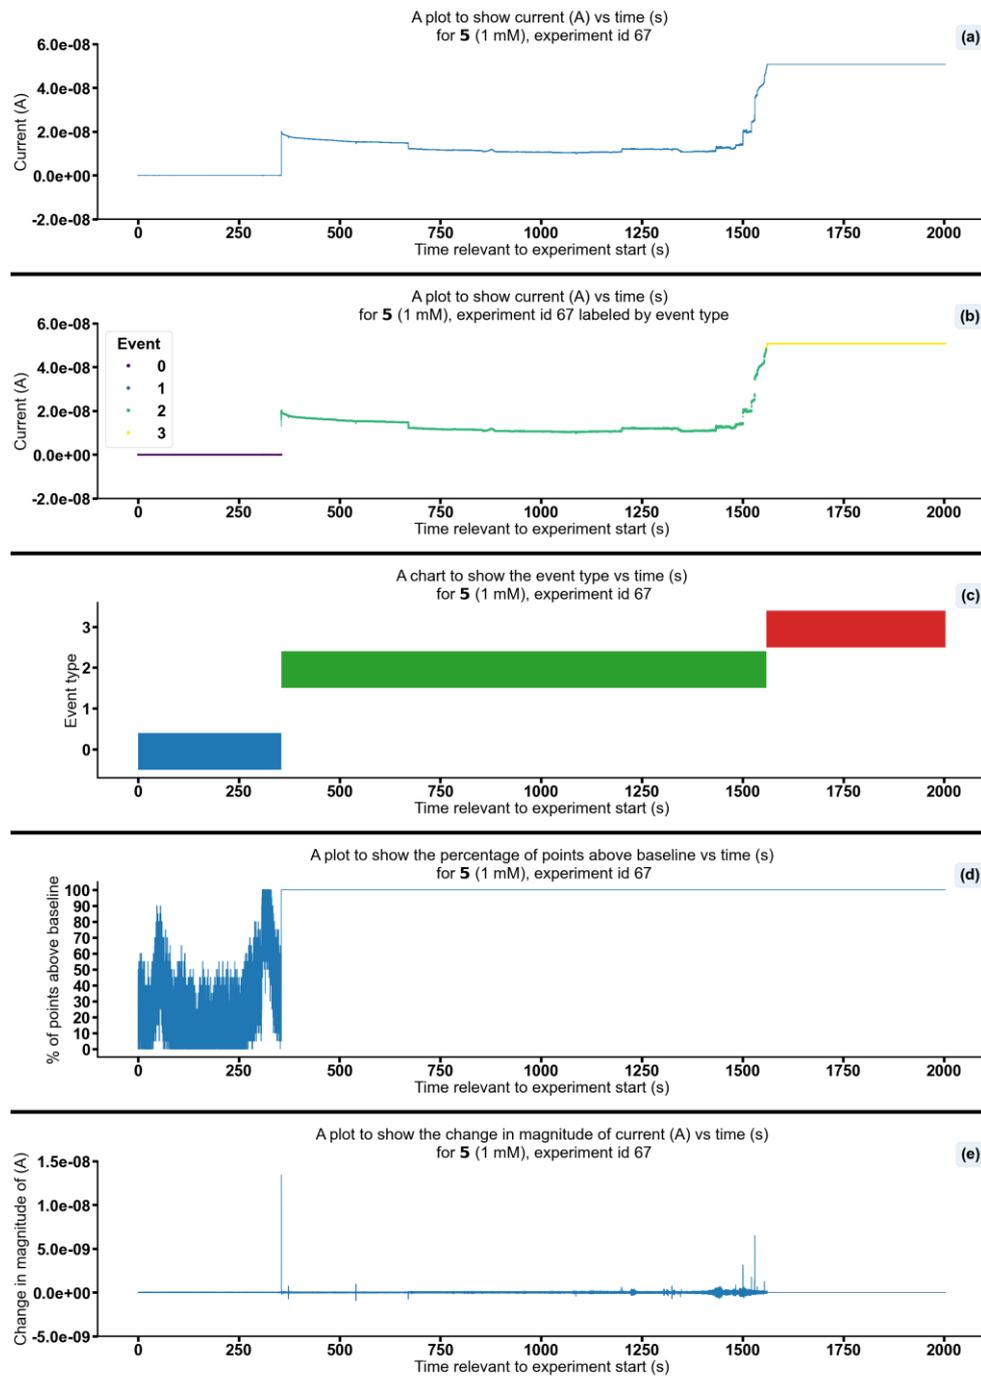

Figure S237 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 67 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -2.0×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

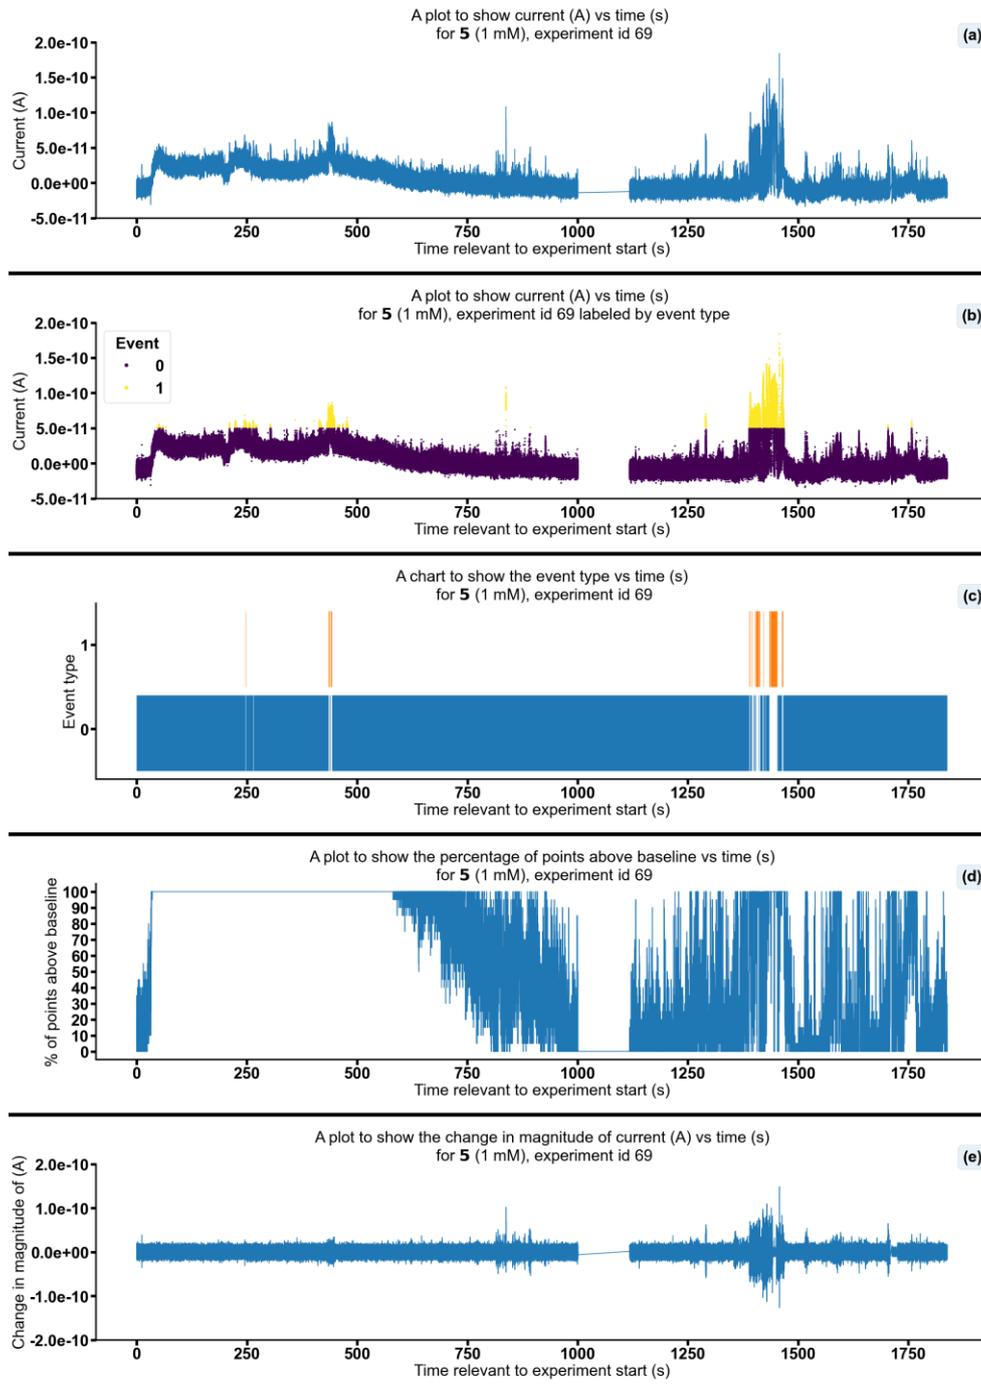

Figure S238 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 69 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -4.2×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

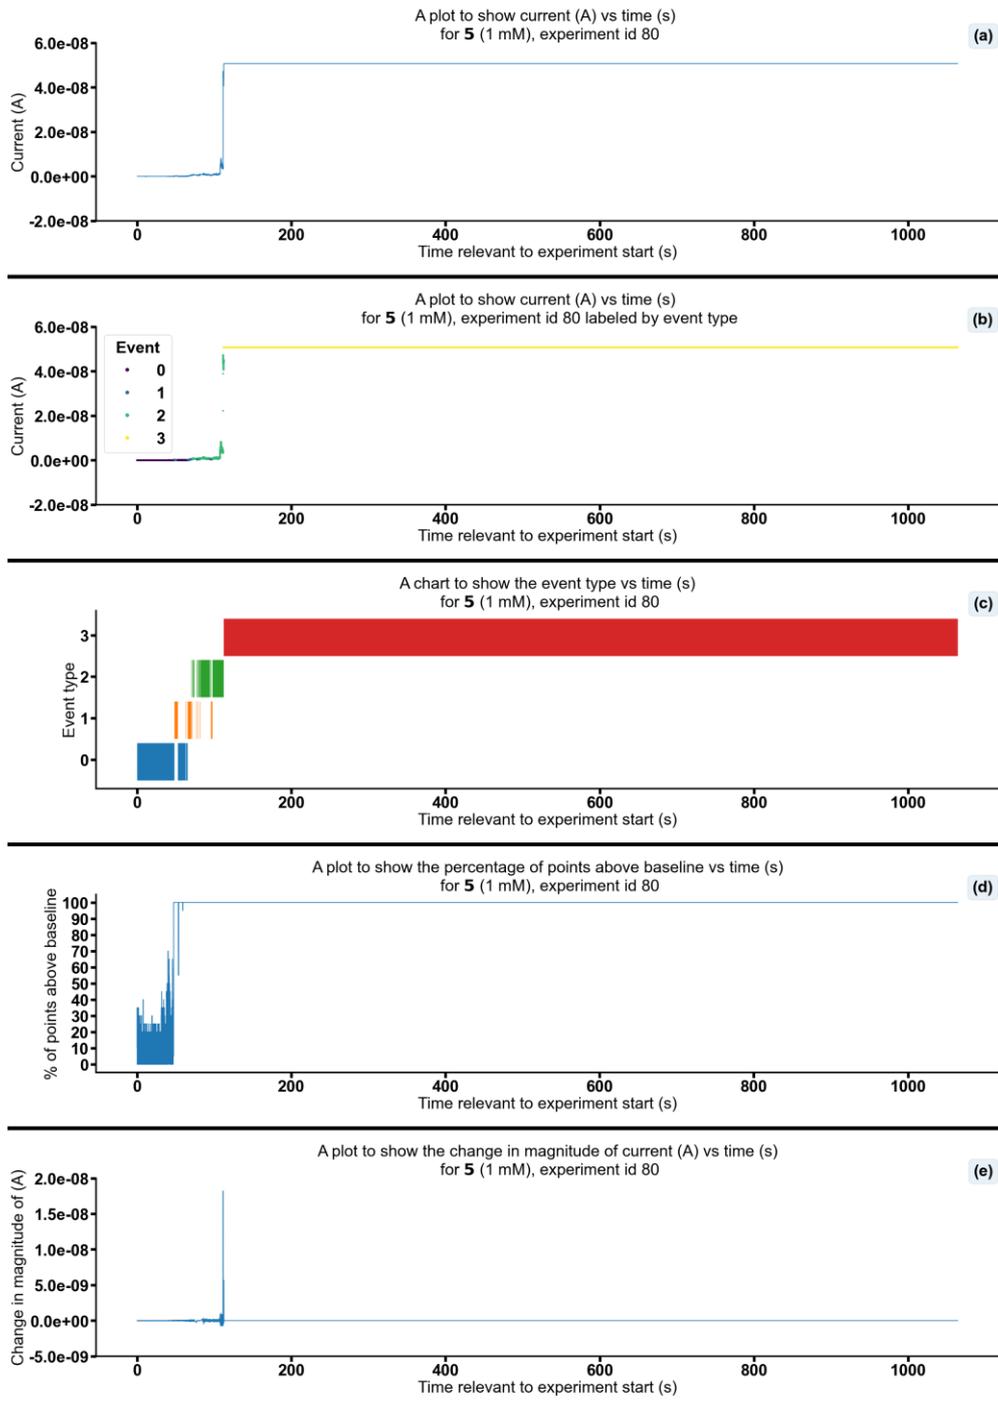

Figure S239 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 80 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing holding voltage with 5

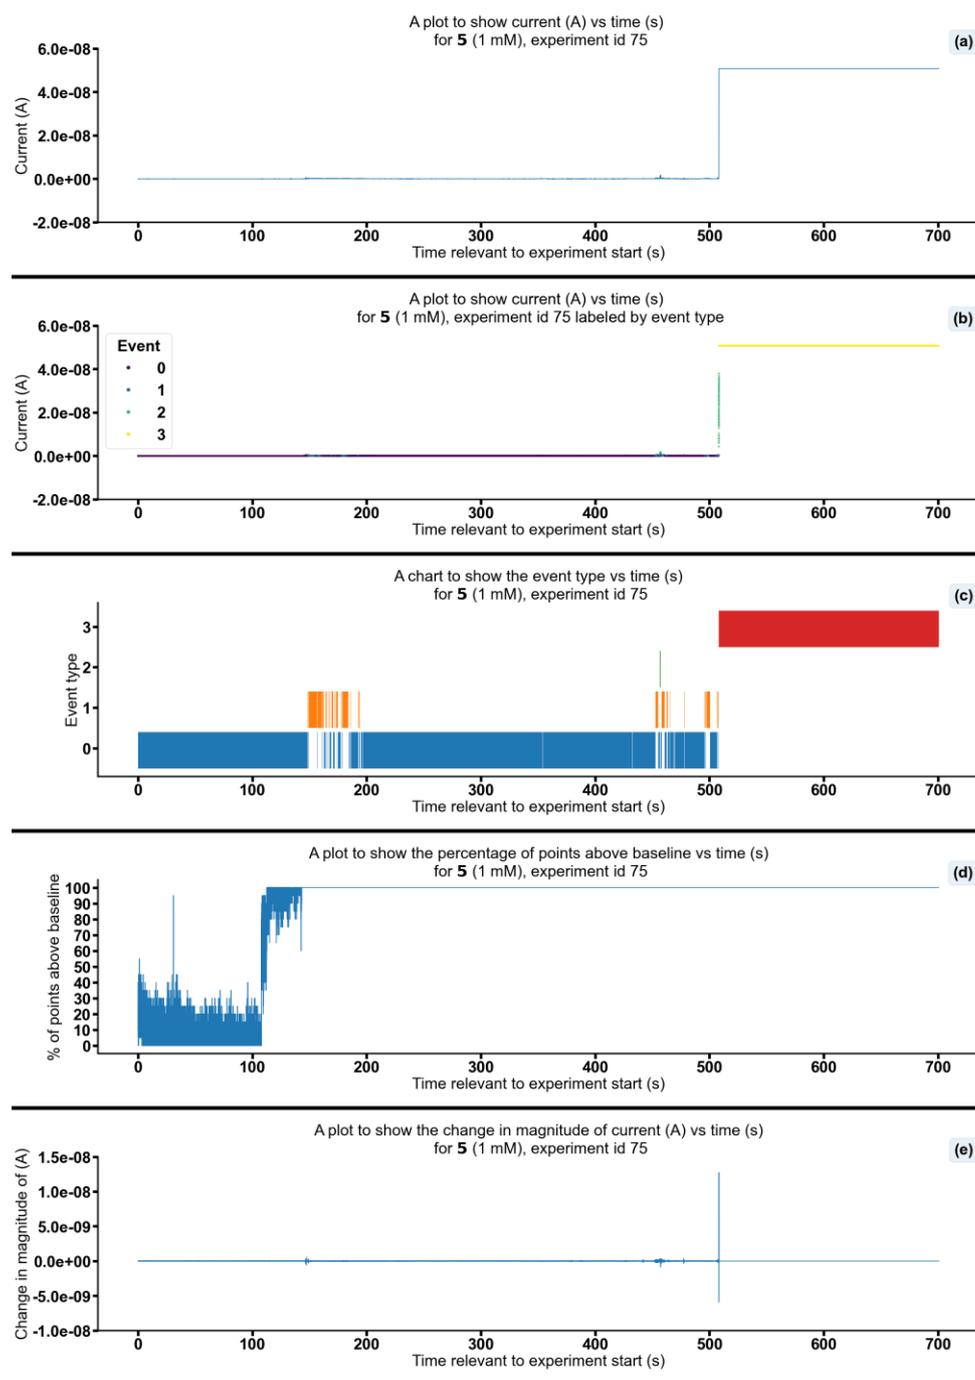

Figure S240 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 75 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.6×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

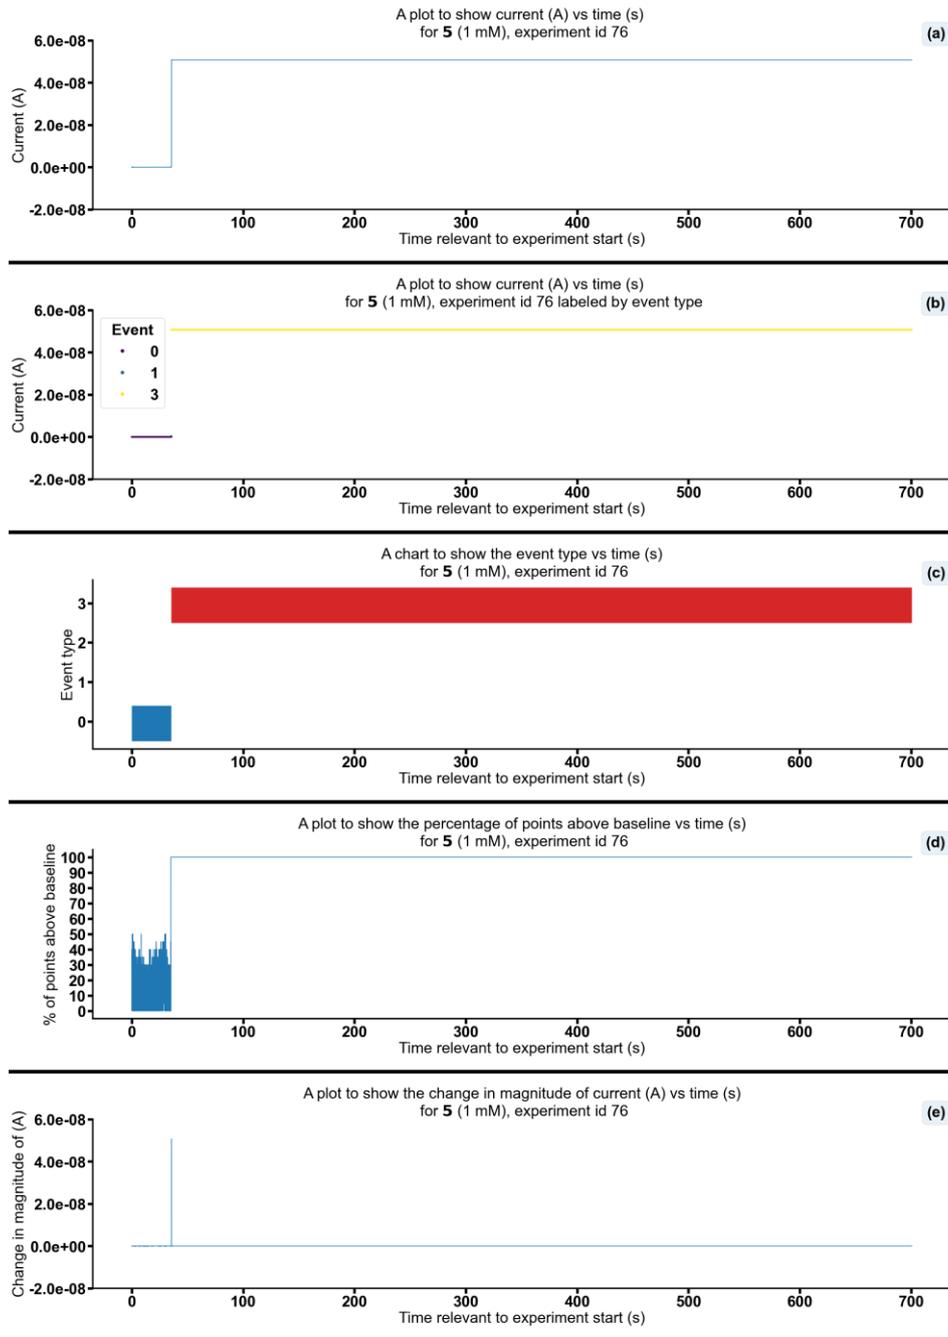

Figure S241 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 76 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -3.4×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

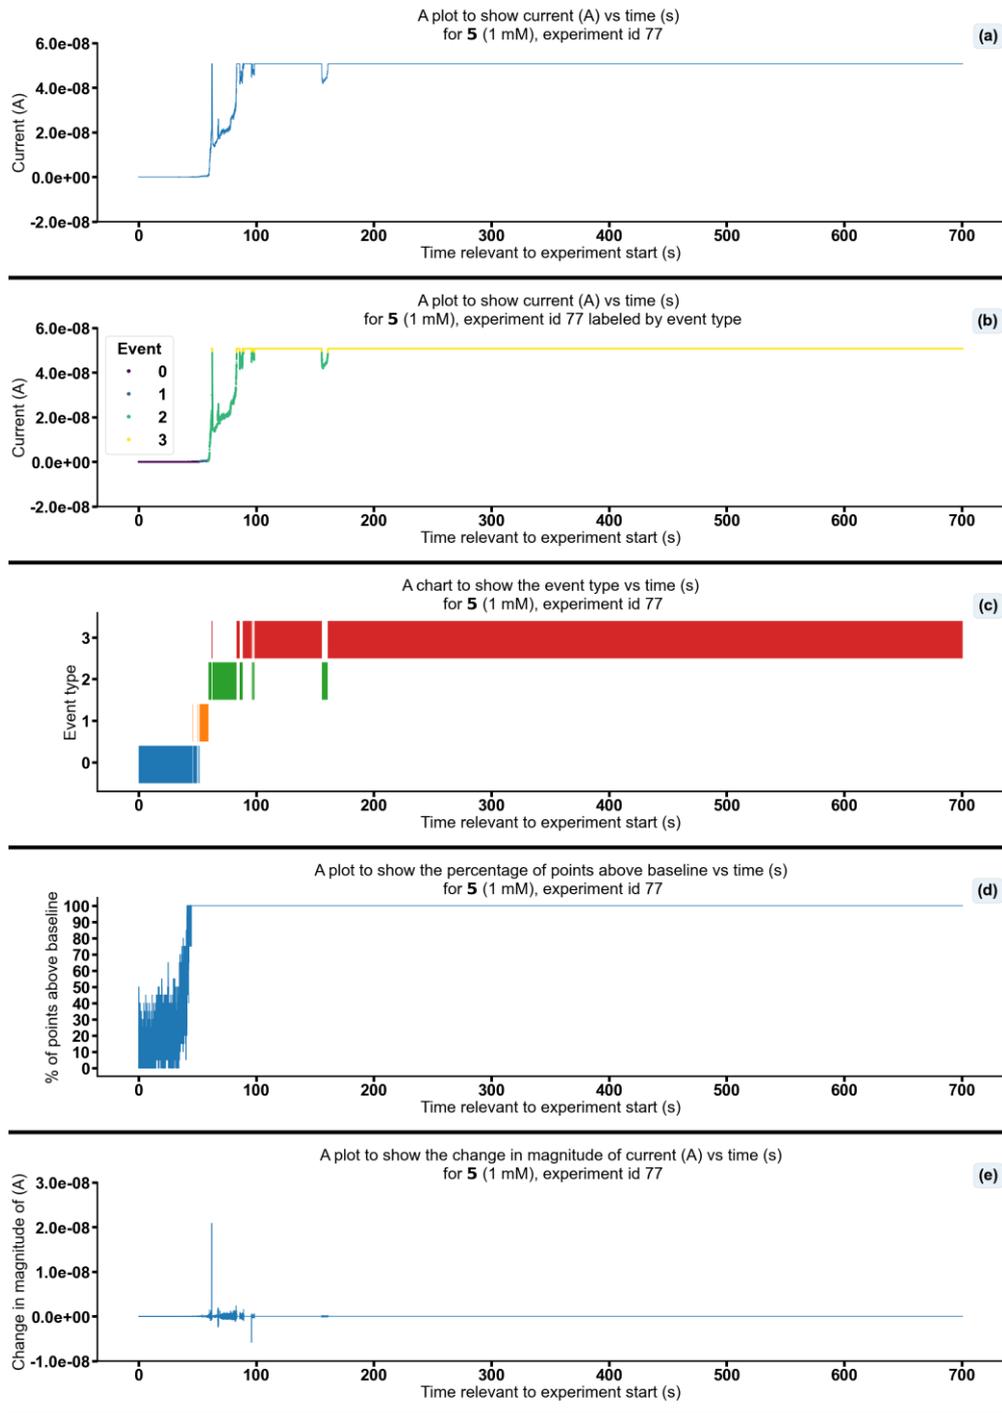

Figure S242 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 77 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.2×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

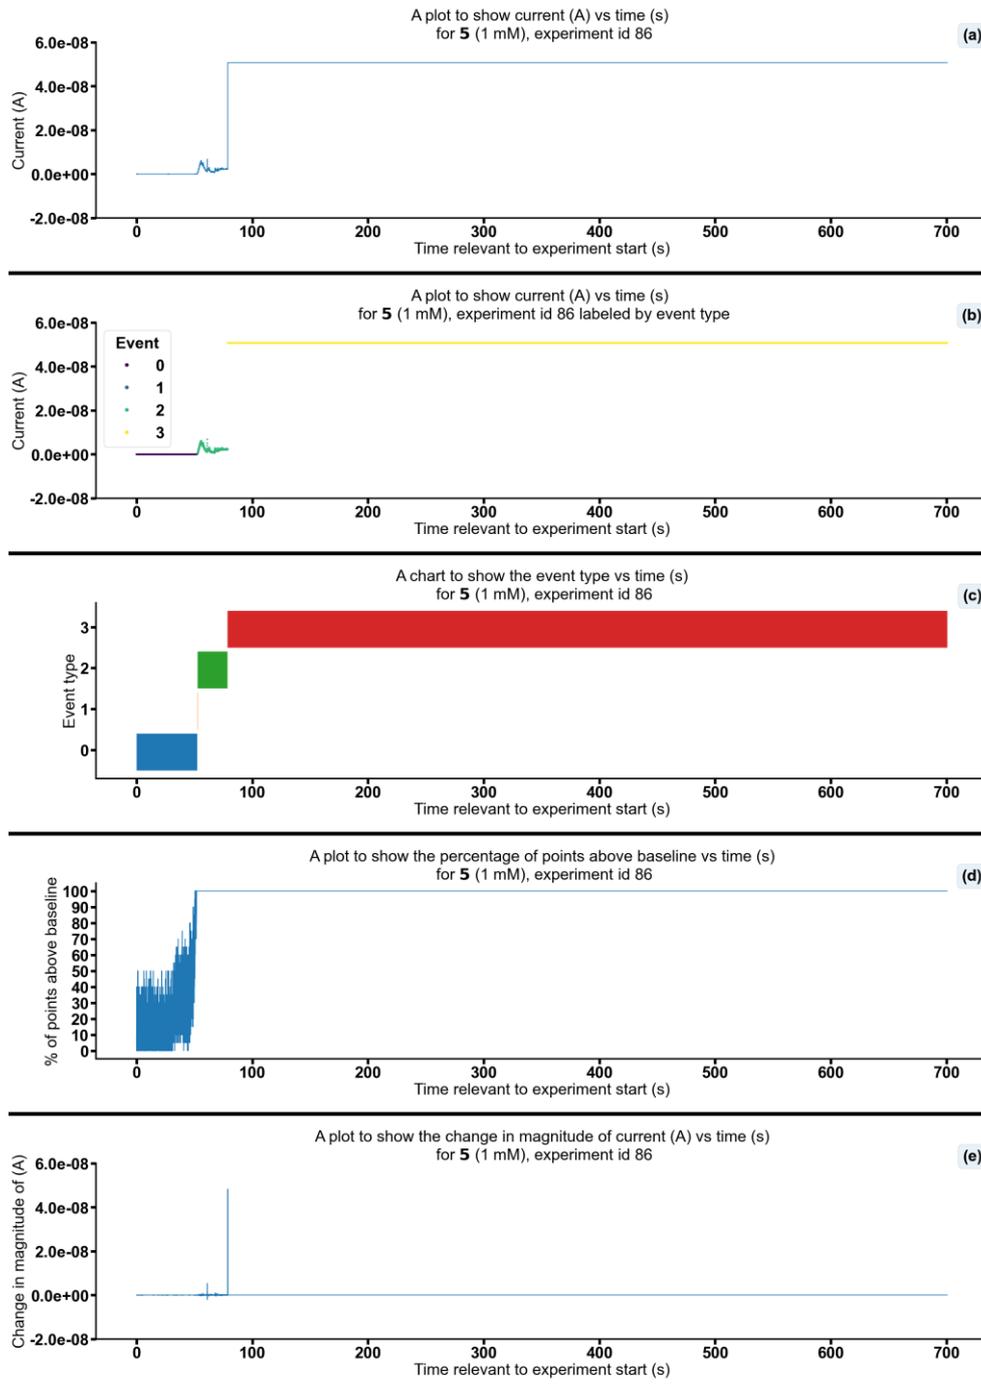

Figure S243 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 86 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.1×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

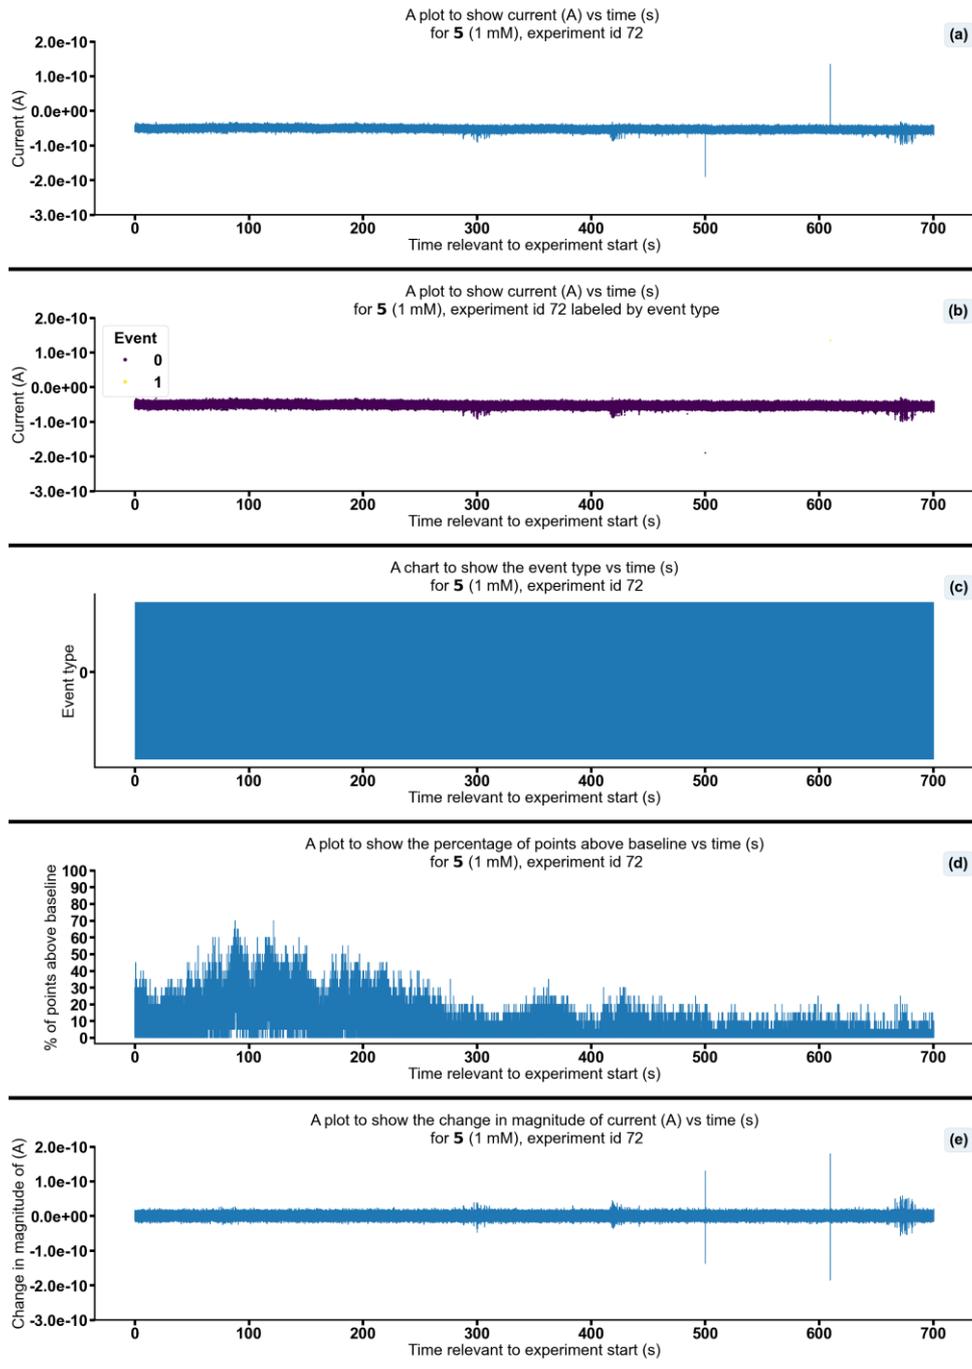

Figure S244 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 72 at +50 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 2.50 \times 10^{-11} \text{ A}$, 1: $2.50 \times 10^{-11} \text{ A} \leq \text{Event 1} < 2.50 \times 10^{-10} \text{ A}$, 2: $2.50 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-4.6 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

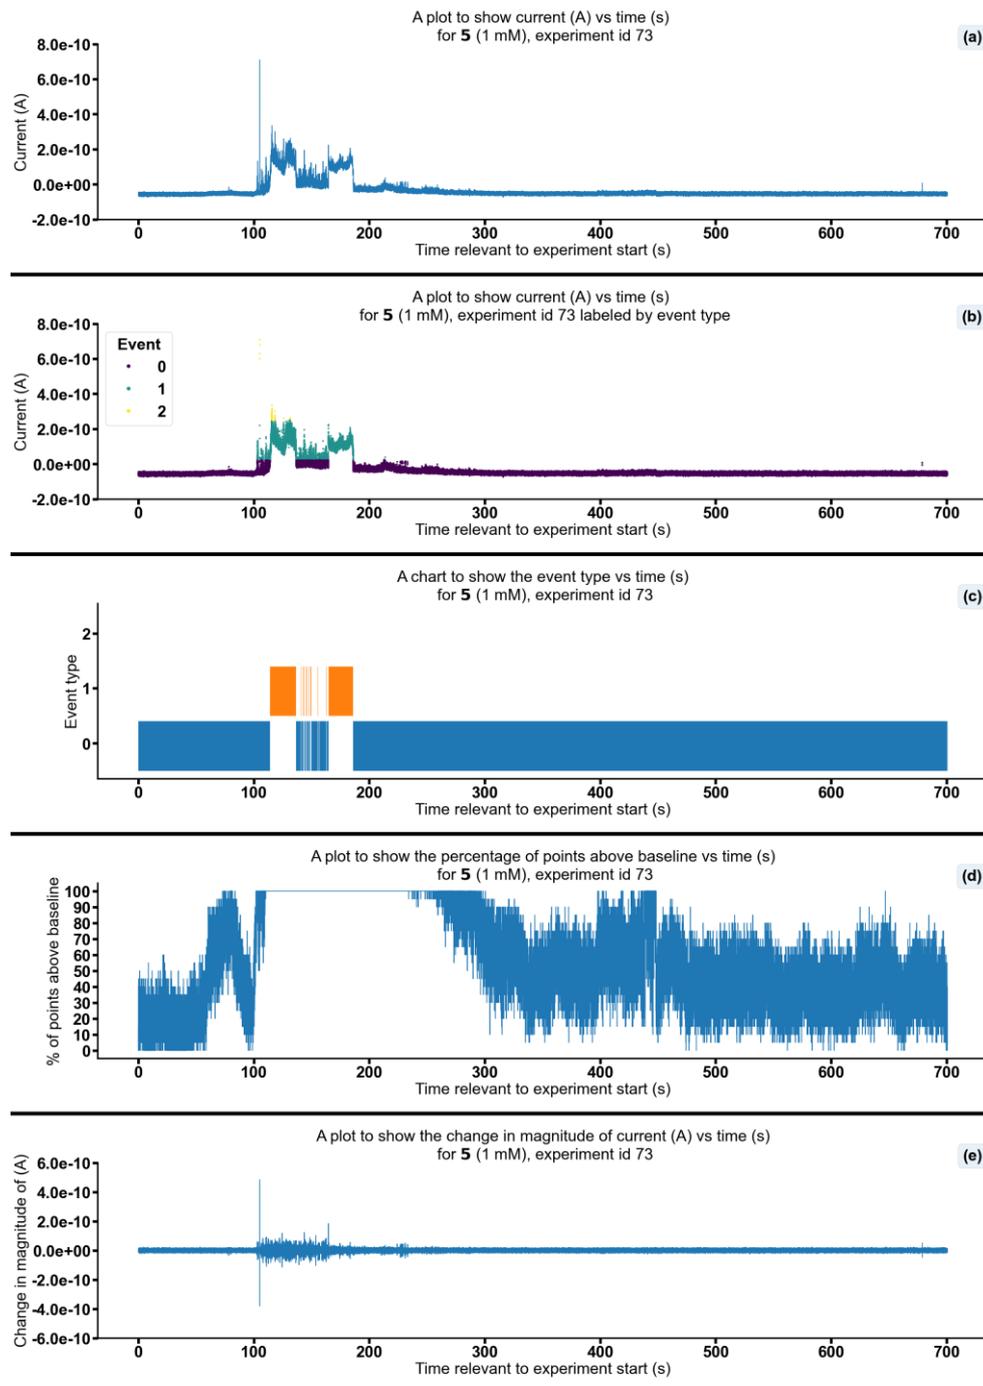

Figure S245 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 73 at +50 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 2.50 \times 10^{-11} \text{ A}$, 1: $2.50 \times 10^{-11} \text{ A} \leq \text{Event 1} < 2.50 \times 10^{-10} \text{ A}$, 2: $2.50 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-5.3 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

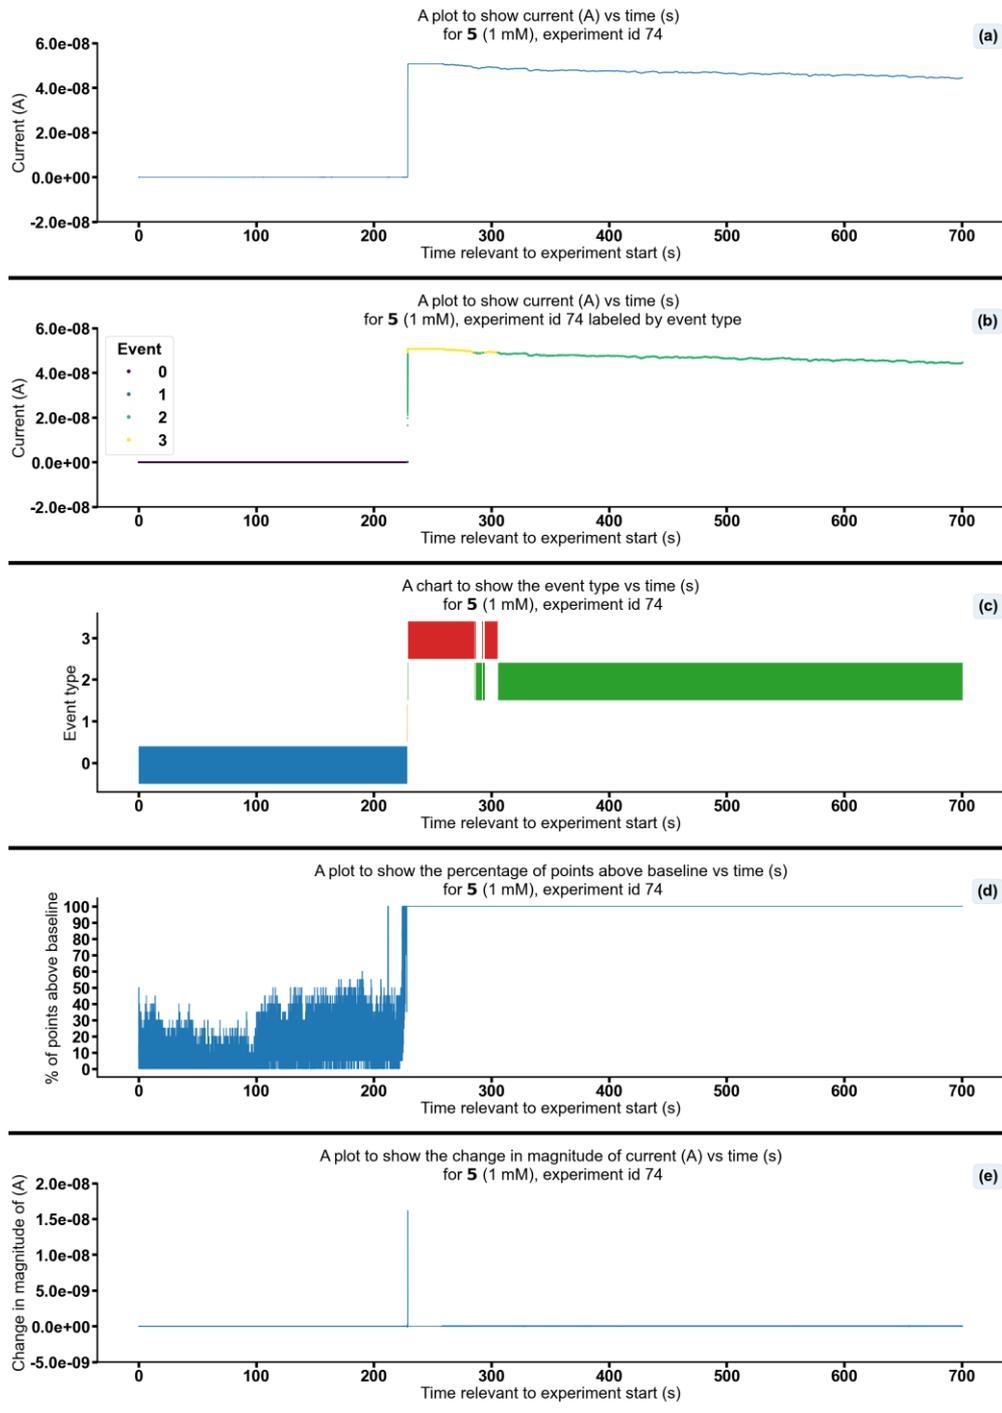

Figure S246 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 74 at +50 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 2.50\text{e-}11 \text{ A}$, 1: $2.50\text{e-}11 \text{ A} \leq \text{Event 1} < 2.50\text{e-}10 \text{ A}$, 2: $2.50\text{e-}10 \text{ A} \leq \text{Event 2} < 4.90\text{e-}08 \text{ A}$, 3: $4.90\text{e-}08 \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-5.0\text{e-}11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

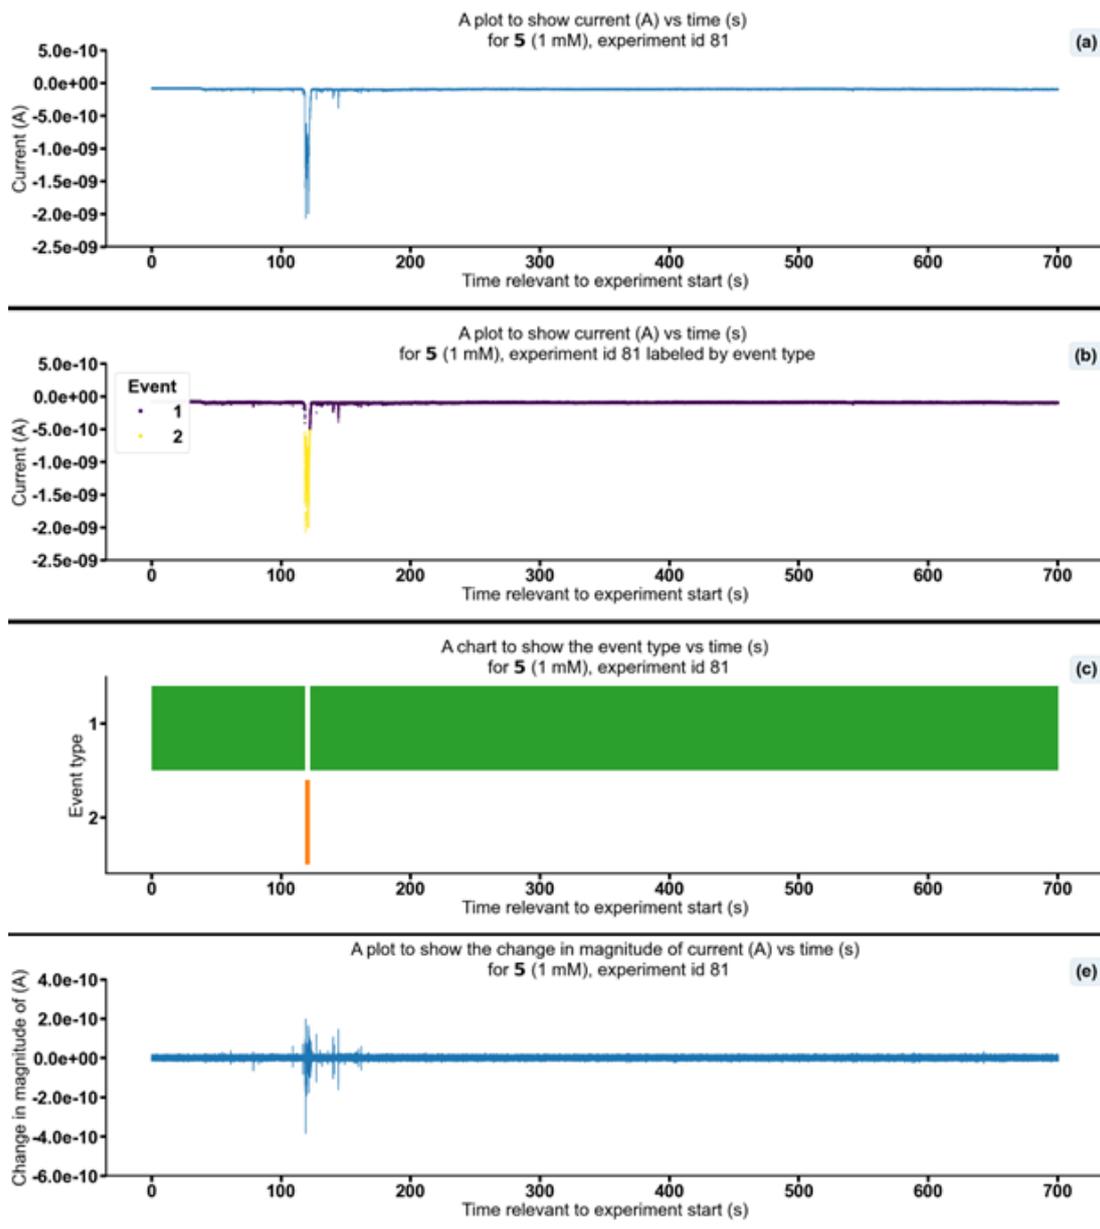

Figure S247 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 81 at -100 mV. Events were categorised into the following types: 0: $-5.00 \times 10^{-11} \text{ A} \leq \text{Event } 0 < \infty \text{ A}$, 1: $-5.00 \times 10^{-10} \text{ A} \leq \text{Event } 1 < -5.00 \times 10^{-11} \text{ A}$, 2: $-4.90 \times 10^{-8} \text{ A} \leq \text{Event } 2 < -5.00 \times 10^{-10} \text{ A}$, 3: $-\infty \text{ A} \leq \text{Event } 3 < -4.90 \times 10^{-8} \text{ A}$. There is no Event 0 as the current of the baseline noise is less than the lower bound of Event 0.

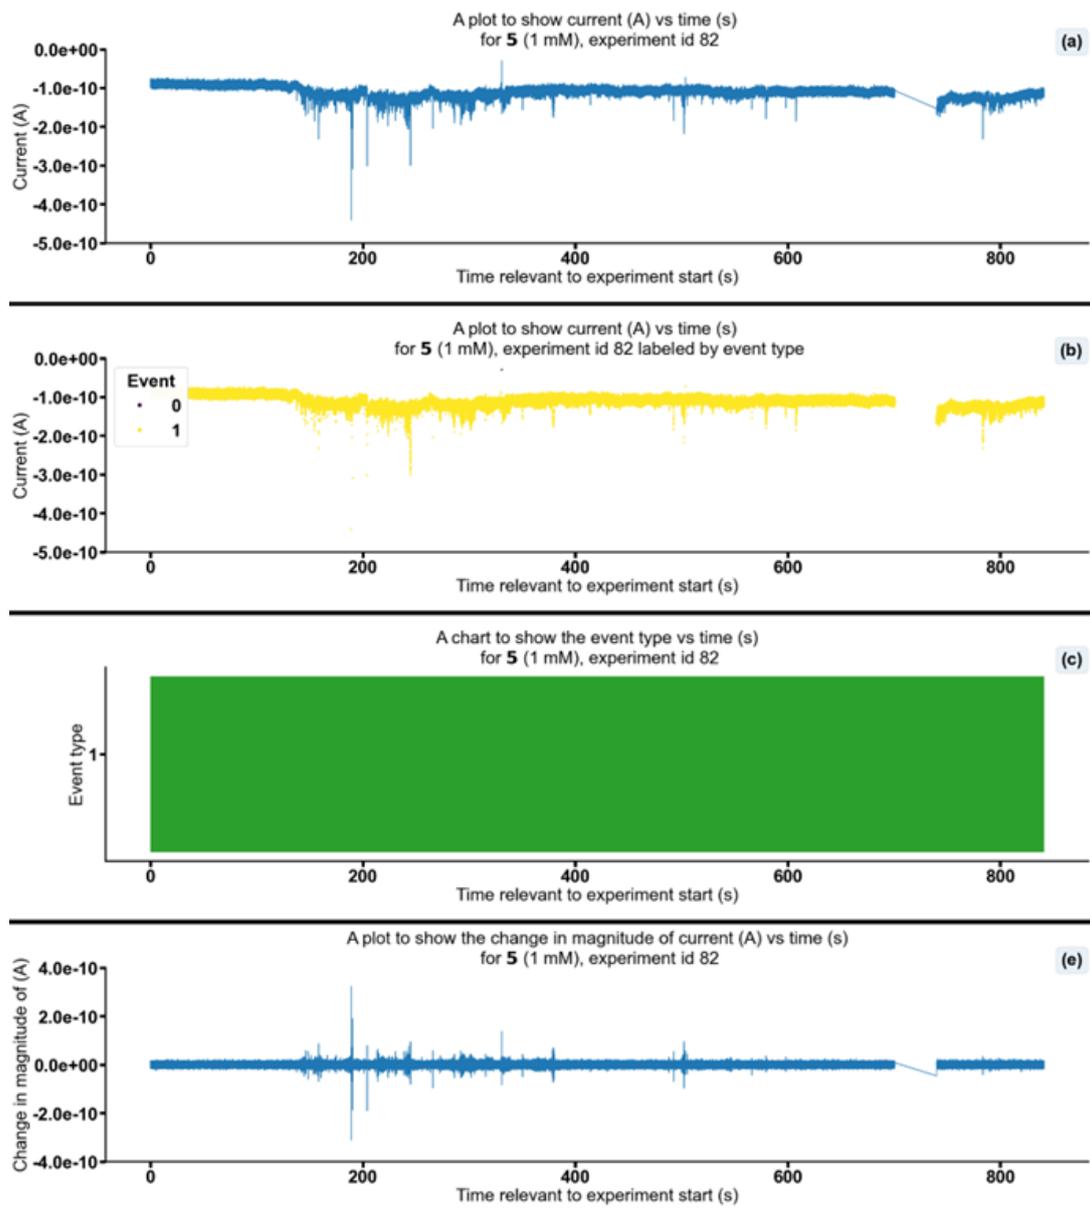

Figure S248 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 82 at -100 mV. Events were categorised into the following types: 0: $-5.00e-11$ A \leq Event 0 $< \infty$ A, 1: $-5.00e-10$ A \leq Event 1 $< -5.00e-11$ A, 2: $-4.90e-08$ A \leq Event 2 $< -5.00e-10$ A, 3: $-\infty$ A \leq Event 3 $< -4.90e-08$ A.

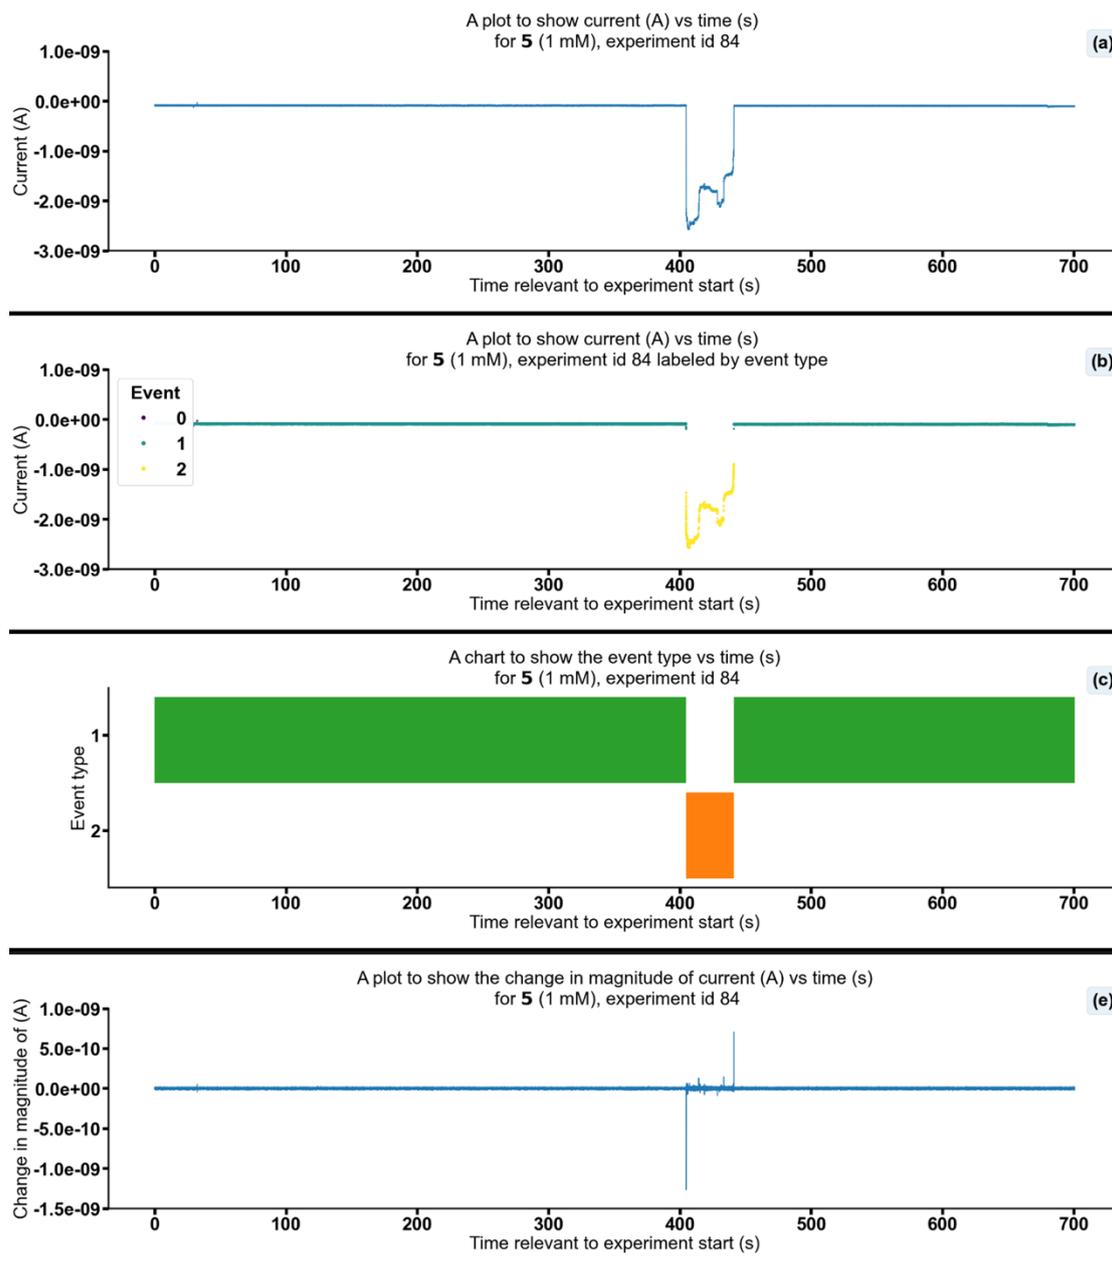

Figure S249 - Summarising the data from the patch clamp experiment for **5** (1 mM), experiment id 84 at -100 mV. Events were categorised into the following types: 0: $-5.00e-11$ A \leq Event 0 $< \infty$ A, 1: $-5.00e-10$ A \leq Event 1 $< -5.00e-11$ A, 2: $-4.90e-08$ A \leq Event 2 $< -5.00e-10$ A, 3: $-\infty$ A \leq Event 3 $< -4.90e-08$ A.

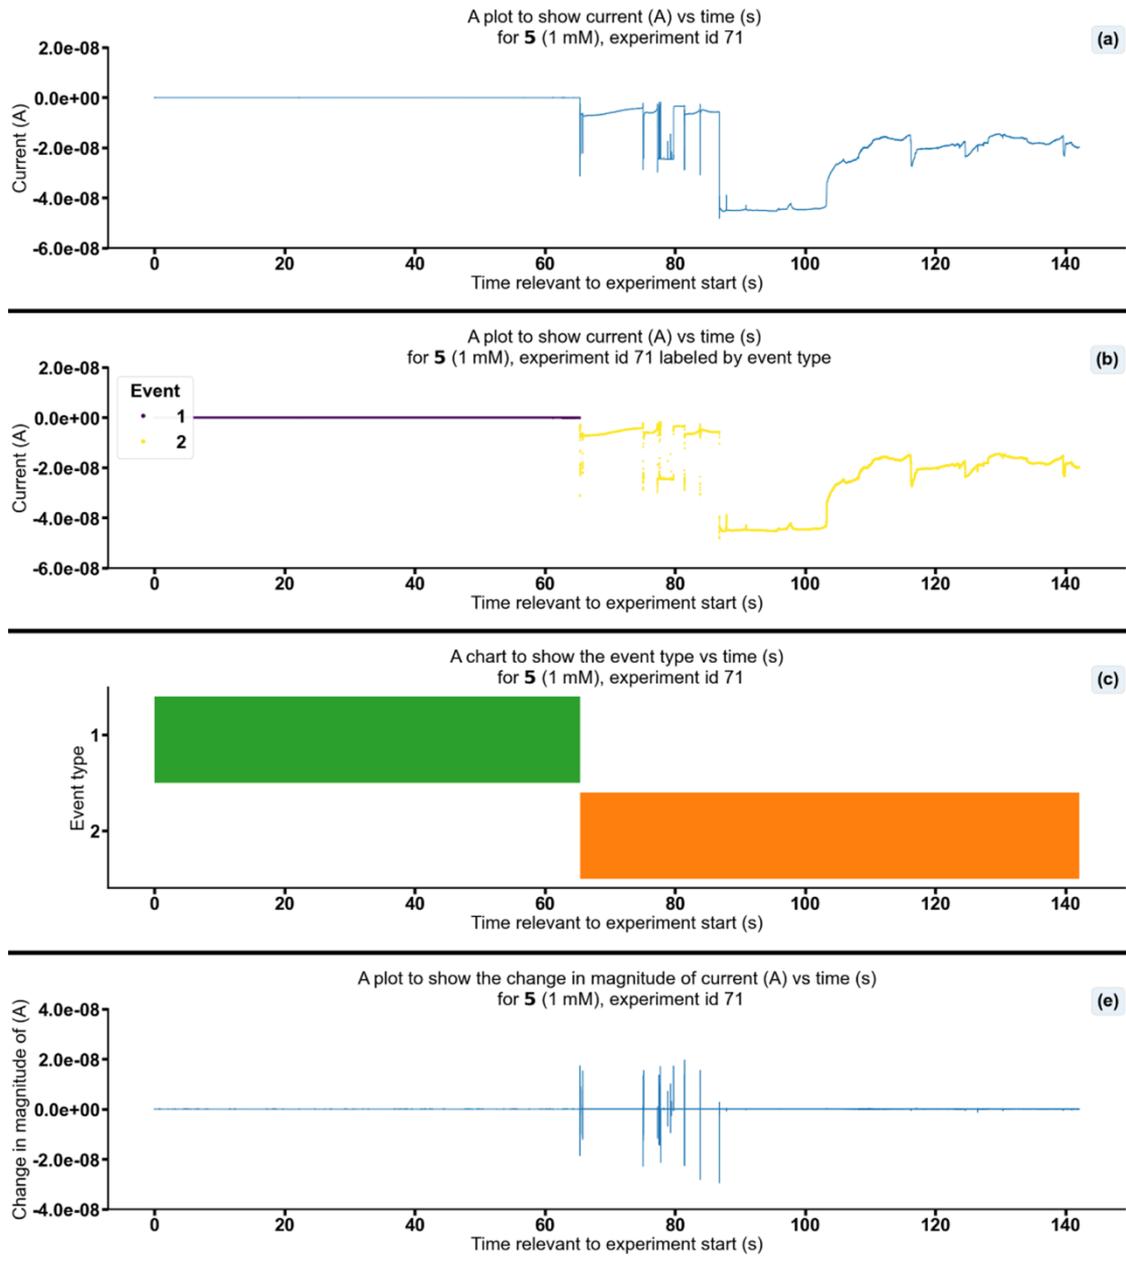

Figure S250 - Summarising the data from the patch clamp experiment for 5 (1 mM), experiment id 71 at -50 mV. Events were categorised into the following types: 0: $-2.50 \times 10^{-11} \text{ A} \leq \text{Event 0} < \infty \text{ A}$, 1: $-2.50 \times 10^{-10} \text{ A} \leq \text{Event 1} < -2.50 \times 10^{-11} \text{ A}$, 2: $-4.90 \times 10^{-8} \text{ A} \leq \text{Event 2} < -2.50 \times 10^{-10} \text{ A}$, 3: $-\infty \text{ A} \leq \text{Event 3} < -4.90 \times 10^{-8} \text{ A}$. There is no Event 0 as the current of the baseline noise is less than the lower bound of Event 0.

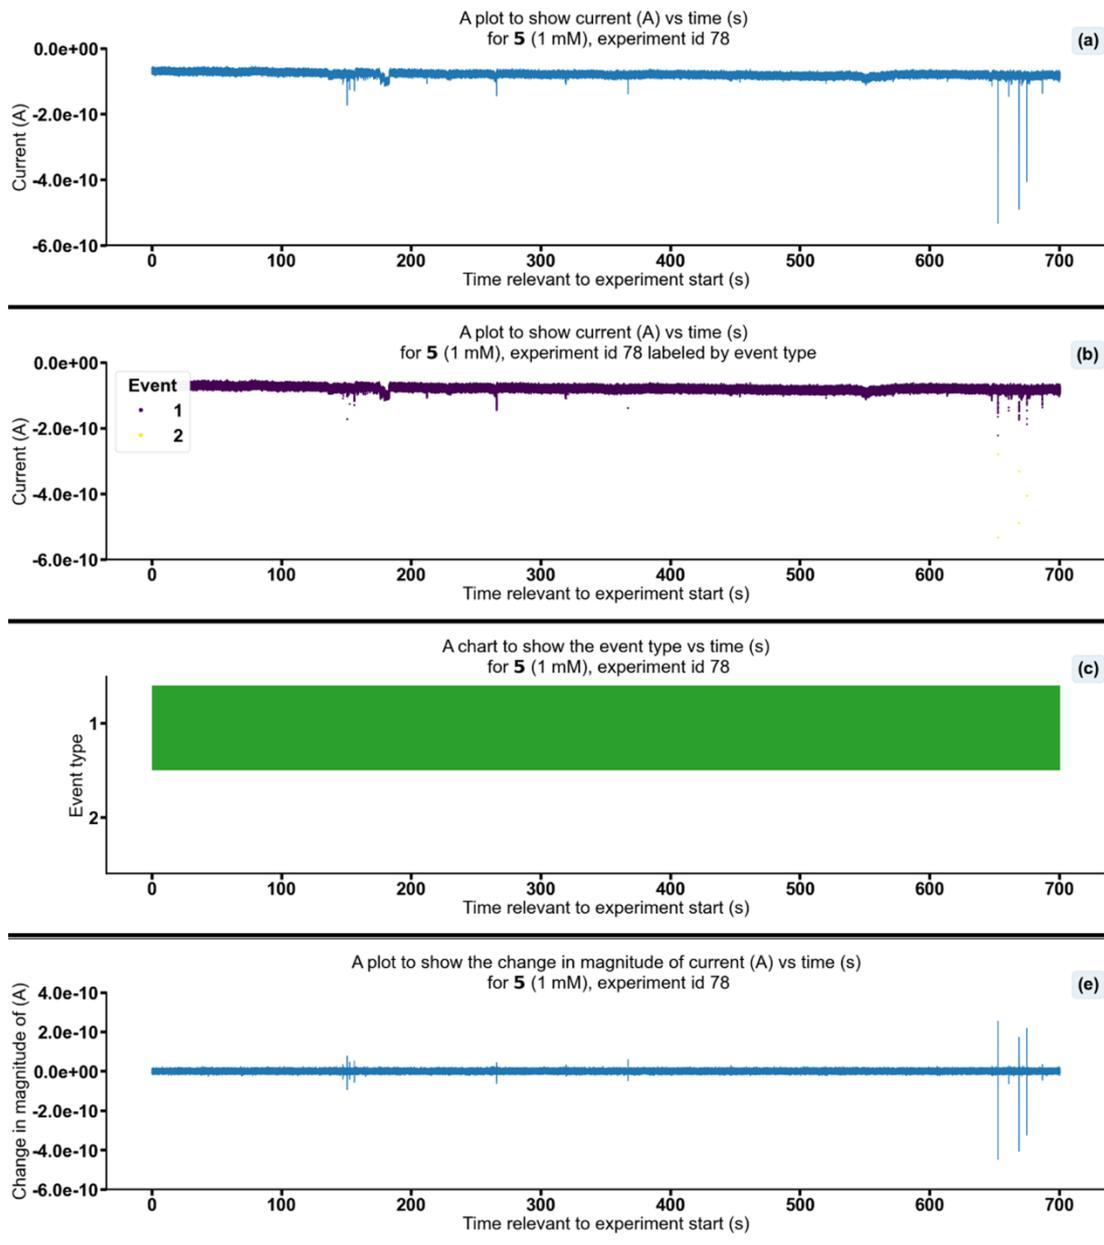

Figure S251 - Summarising the data from the patch clamp experiment for **5** (1 mM), experiment id 78 at -50 mV. Events were categorised into the following types: 0: $-2.50e-11 \text{ A} \leq \text{Event 0} < \infty \text{ A}$, 1: $-2.50e-10 \text{ A} \leq \text{Event 1} < -2.50e-11 \text{ A}$, 2: $-4.90e-08 \text{ A} \leq \text{Event 2} < -2.50e-10 \text{ A}$, 3: $-\infty \text{ A} \leq \text{Event 3} < -4.90e-08 \text{ A}$. There is no Event 0 as the current of the baseline noise is less than the lower bound of Event 0.

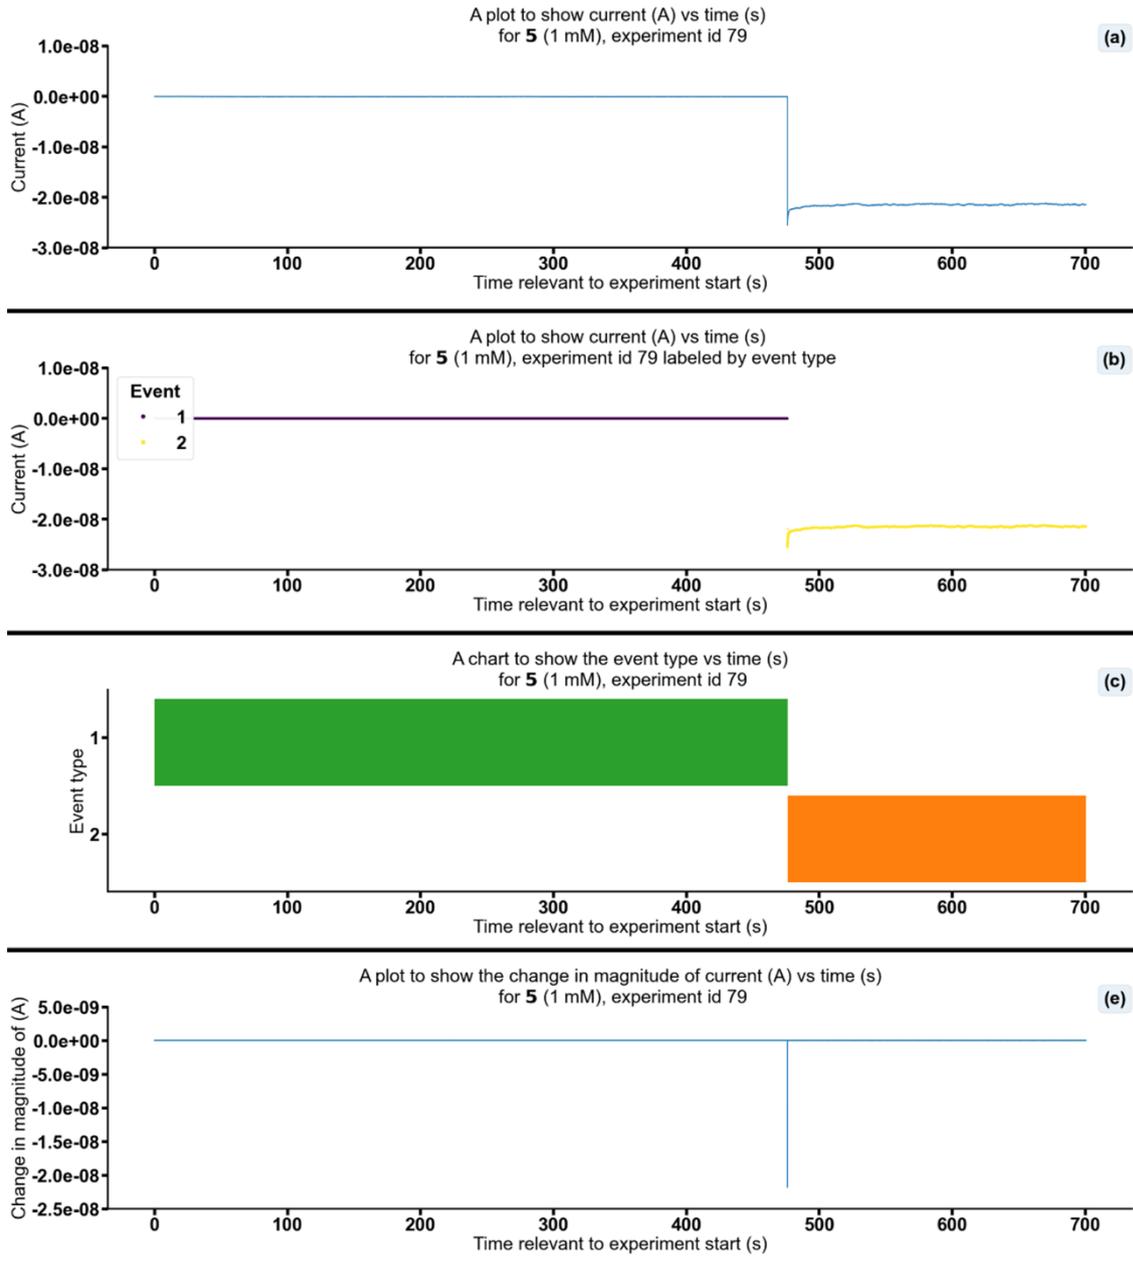

Figure S252 - Summarising the data from the patch clamp experiment for **5** (1 mM), experiment id 79 at -50 mV. Events were categorised into the following types: 0: $-2.50e-11$ A \leq Event 0 $< \infty$ A, 1: $-2.50e-10$ A \leq Event 1 $< -2.50e-11$ A, 2: $-4.90e-08$ A \leq Event 2 $< -2.50e-10$ A, 3: $-\infty$ A \leq Event 3 $< -4.90e-08$ A. There is no Event 0 as the current of the baseline noise is less than the lower bound of Event 0.

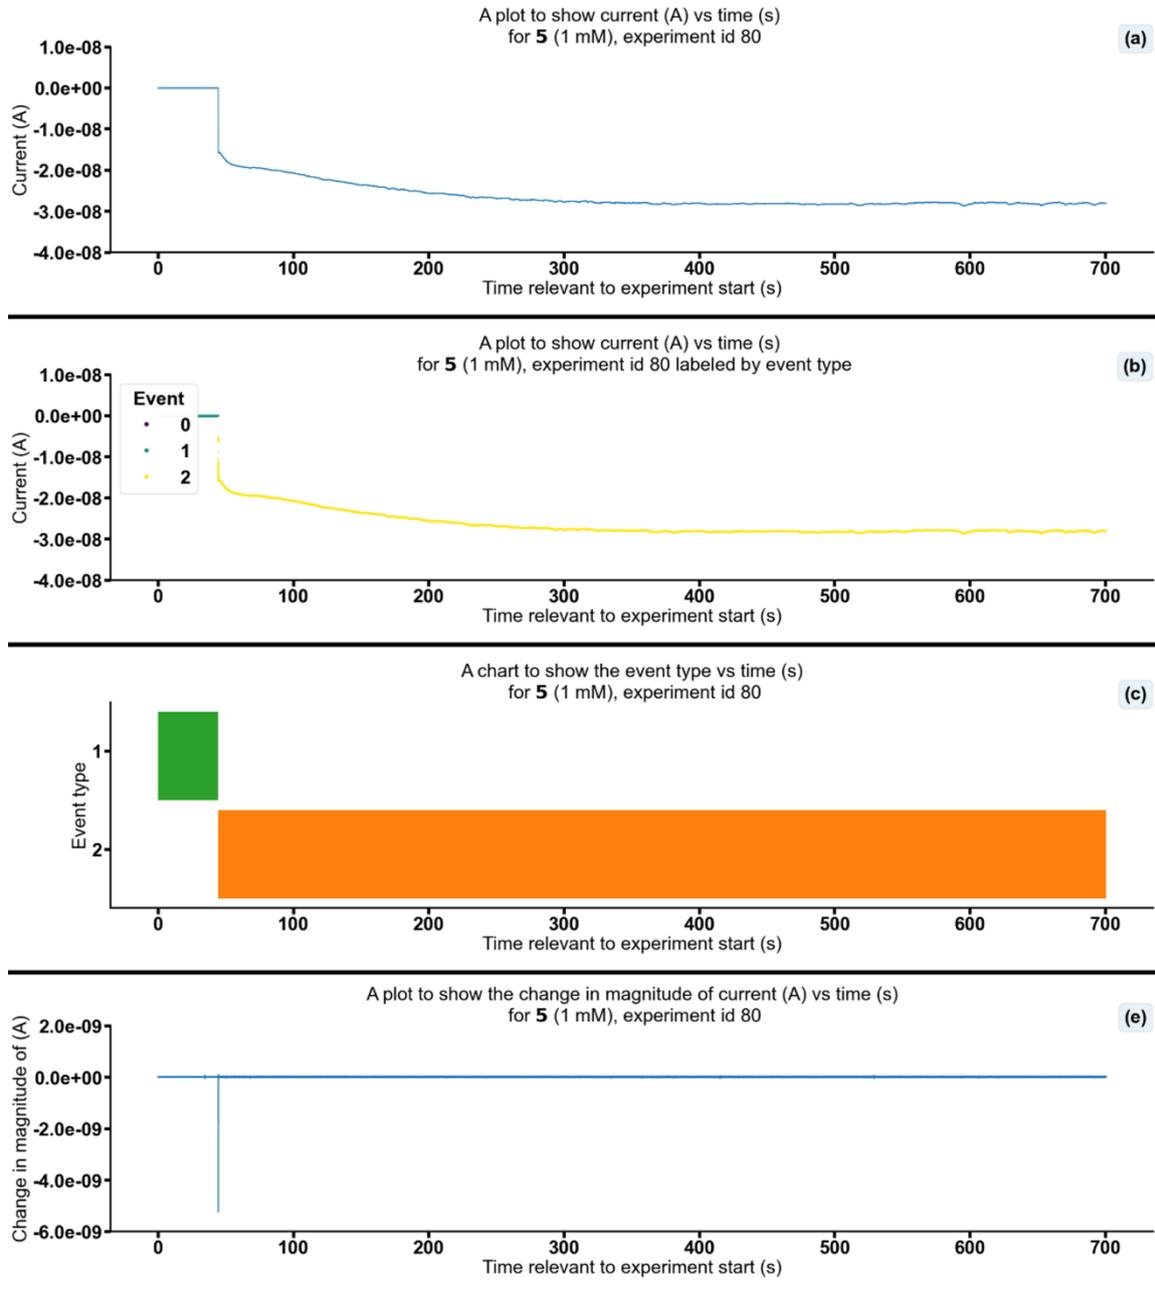

Figure S253 - Summarising the data from the patch clamp experiment for **5** (1 mM), experiment id 80 at -50 mV. Events were categorised into the following types: 0: $-2.50e-11 \text{ A} \leq \text{Event 0} < \infty \text{ A}$, 1: $-2.50e-10 \text{ A} \leq \text{Event 1} < -2.50e-11 \text{ A}$, 2: $-4.90e-08 \text{ A} \leq \text{Event 2} < -2.50e-10 \text{ A}$, 3: $-\infty \text{ A} \leq \text{Event 3} < -4.90e-08 \text{ A}$.

Changing the concentration of **3** and **5** (1:1)

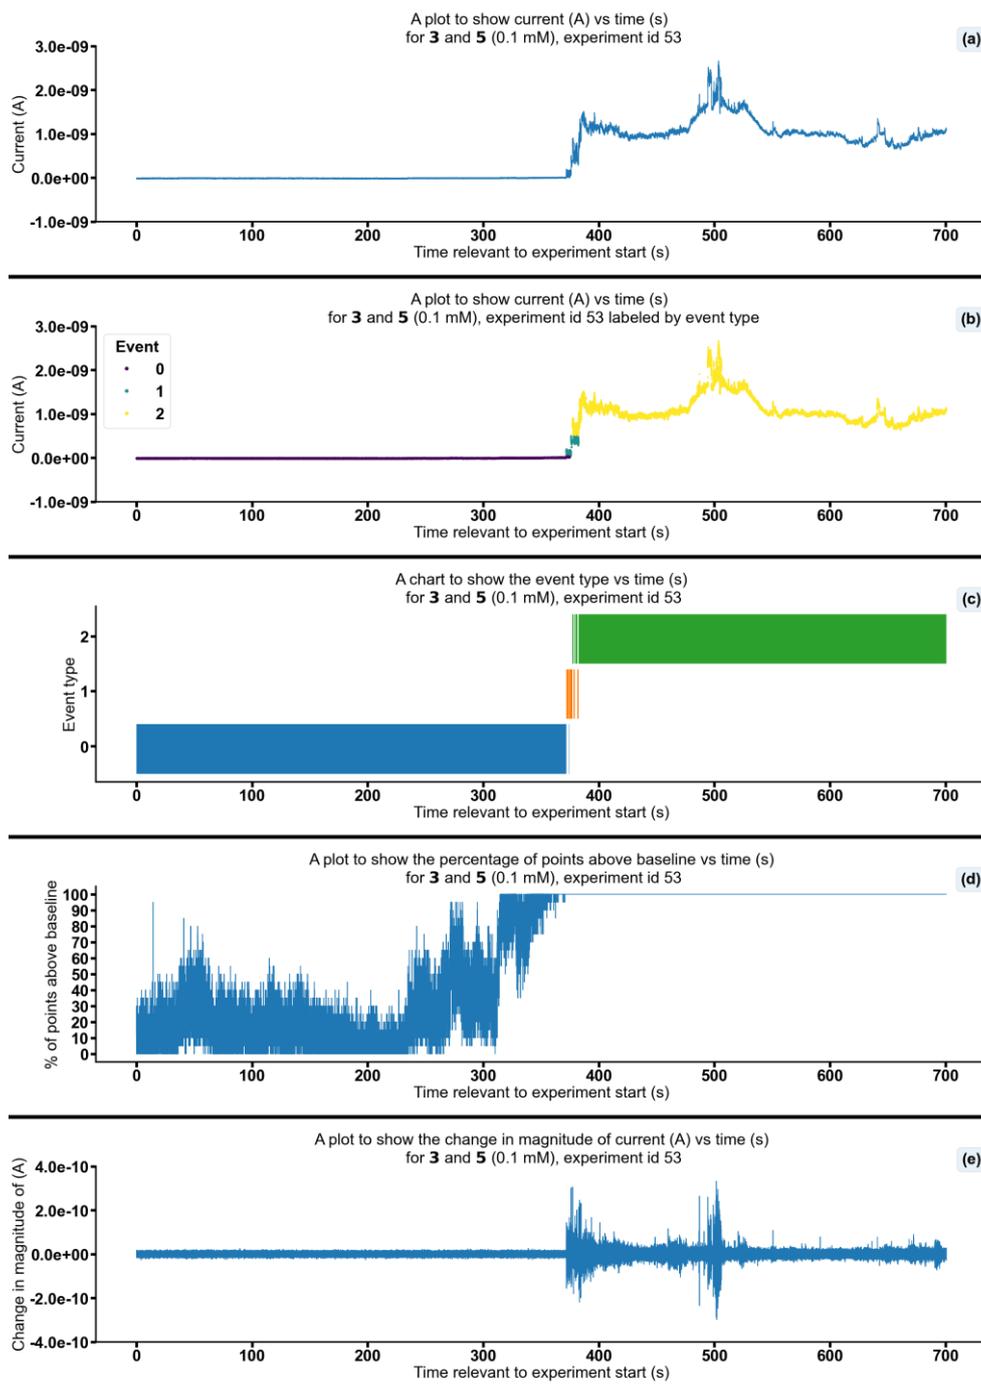

Figure S254 - Summarising the data from the patch clamp experiment for **3** and **5** (0.1 mM), experiment id 53 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00\text{e-}11 \text{ A}$, 1: $5.00\text{e-}11 \text{ A} \leq$ Event 1 $< 5.00\text{e-}10 \text{ A}$, 2: $5.00\text{e-}10 \text{ A} \leq$ Event 2 $< 4.90\text{e-}08 \text{ A}$, 3: $4.90\text{e-}08 \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.1\text{e-}11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

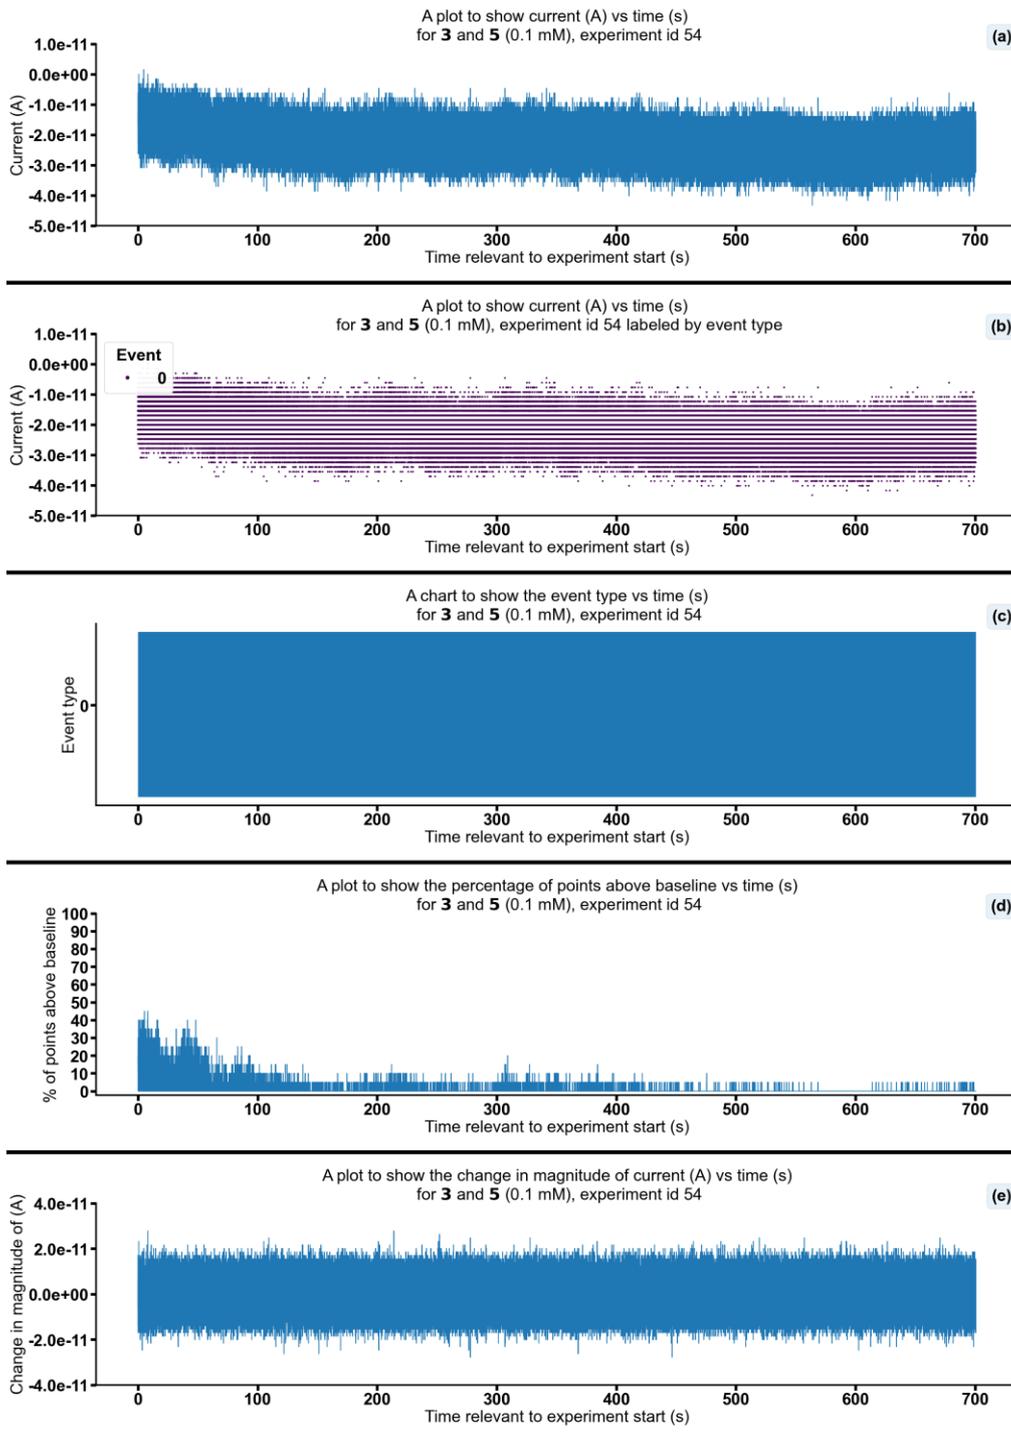

Figure S255 - Summarising the data from the patch clamp experiment for **3** and **5** (0.1 mM), experiment id 54 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

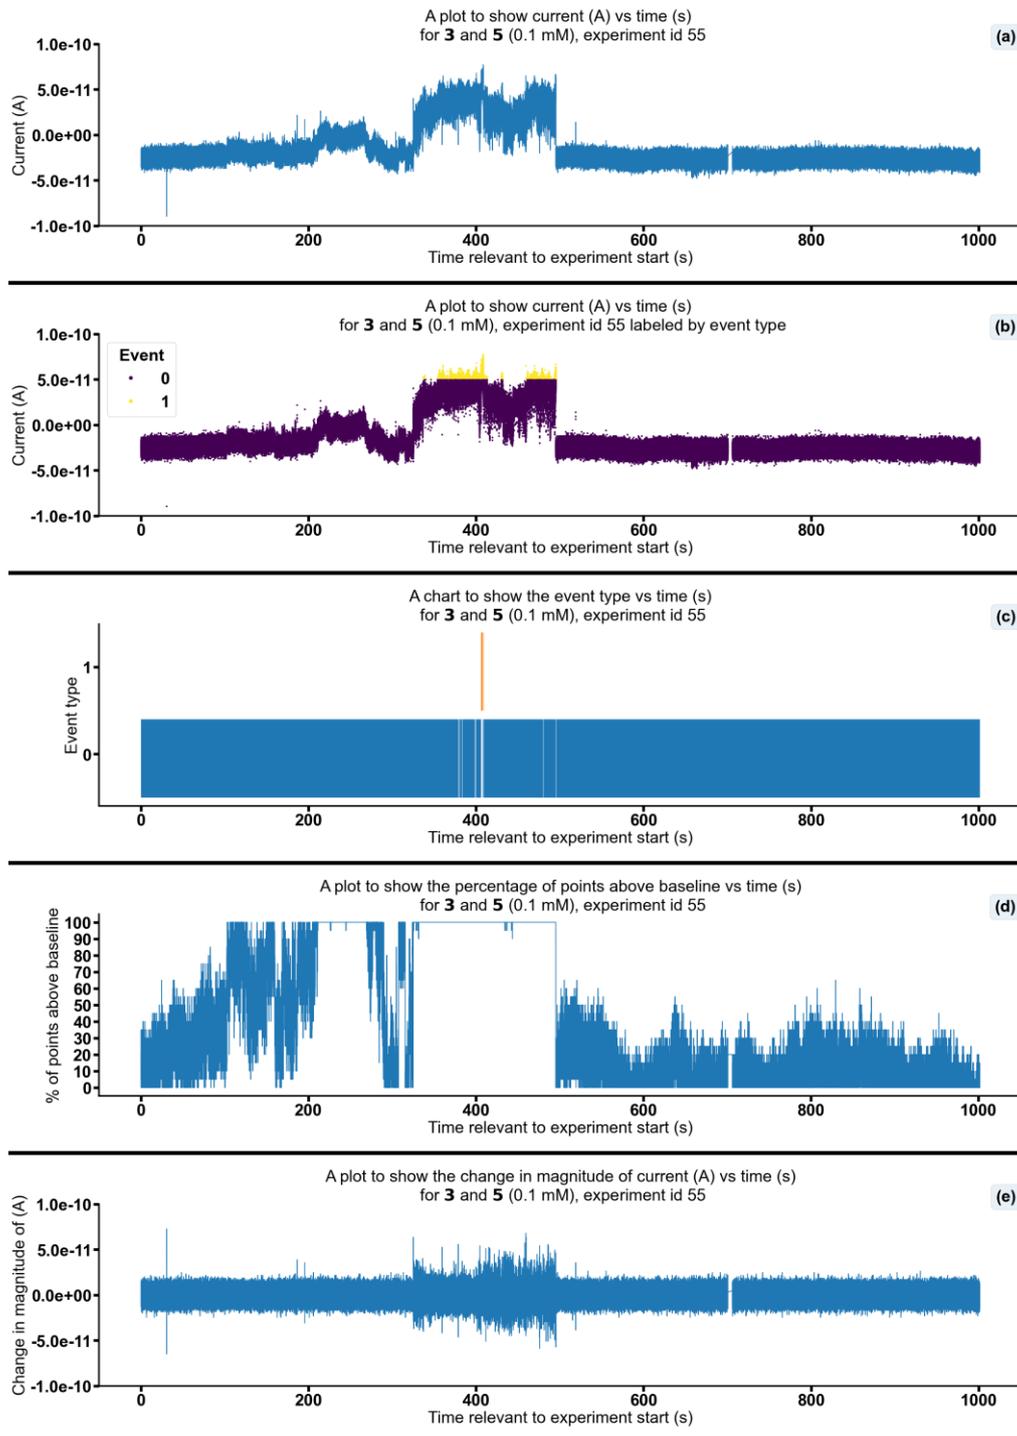

Figure S256 - Summarising the data from the patch clamp experiment for **3** and **5** (0.1 mM), experiment id 55 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.1 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

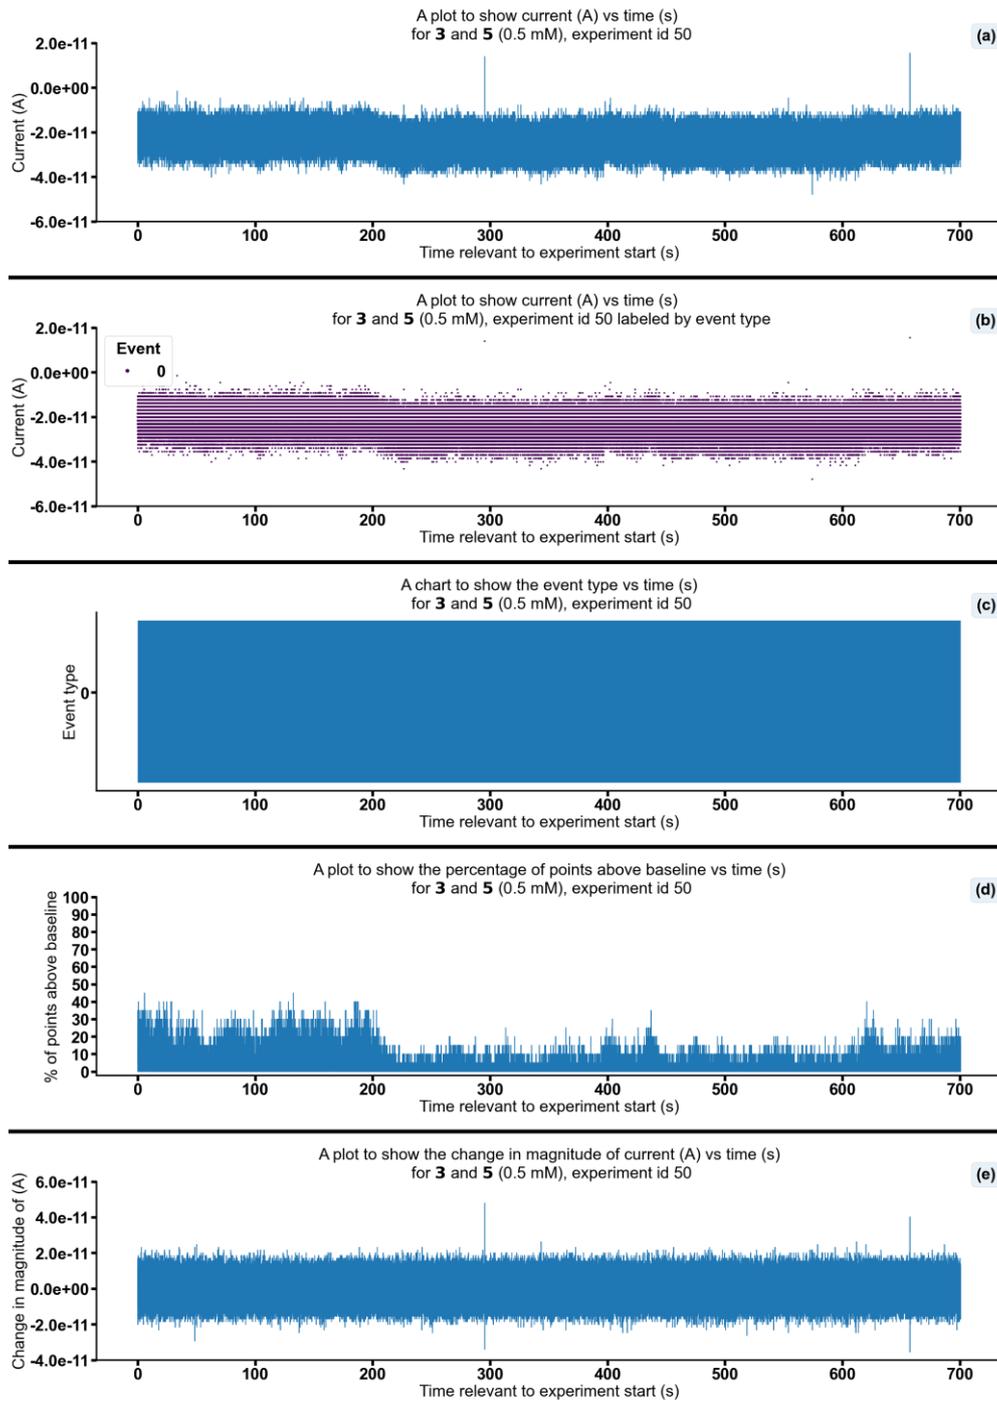

Figure S257 - Summarising the data from the patch clamp experiment for **3** and **5** (0.5 mM), experiment id 50 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.6×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

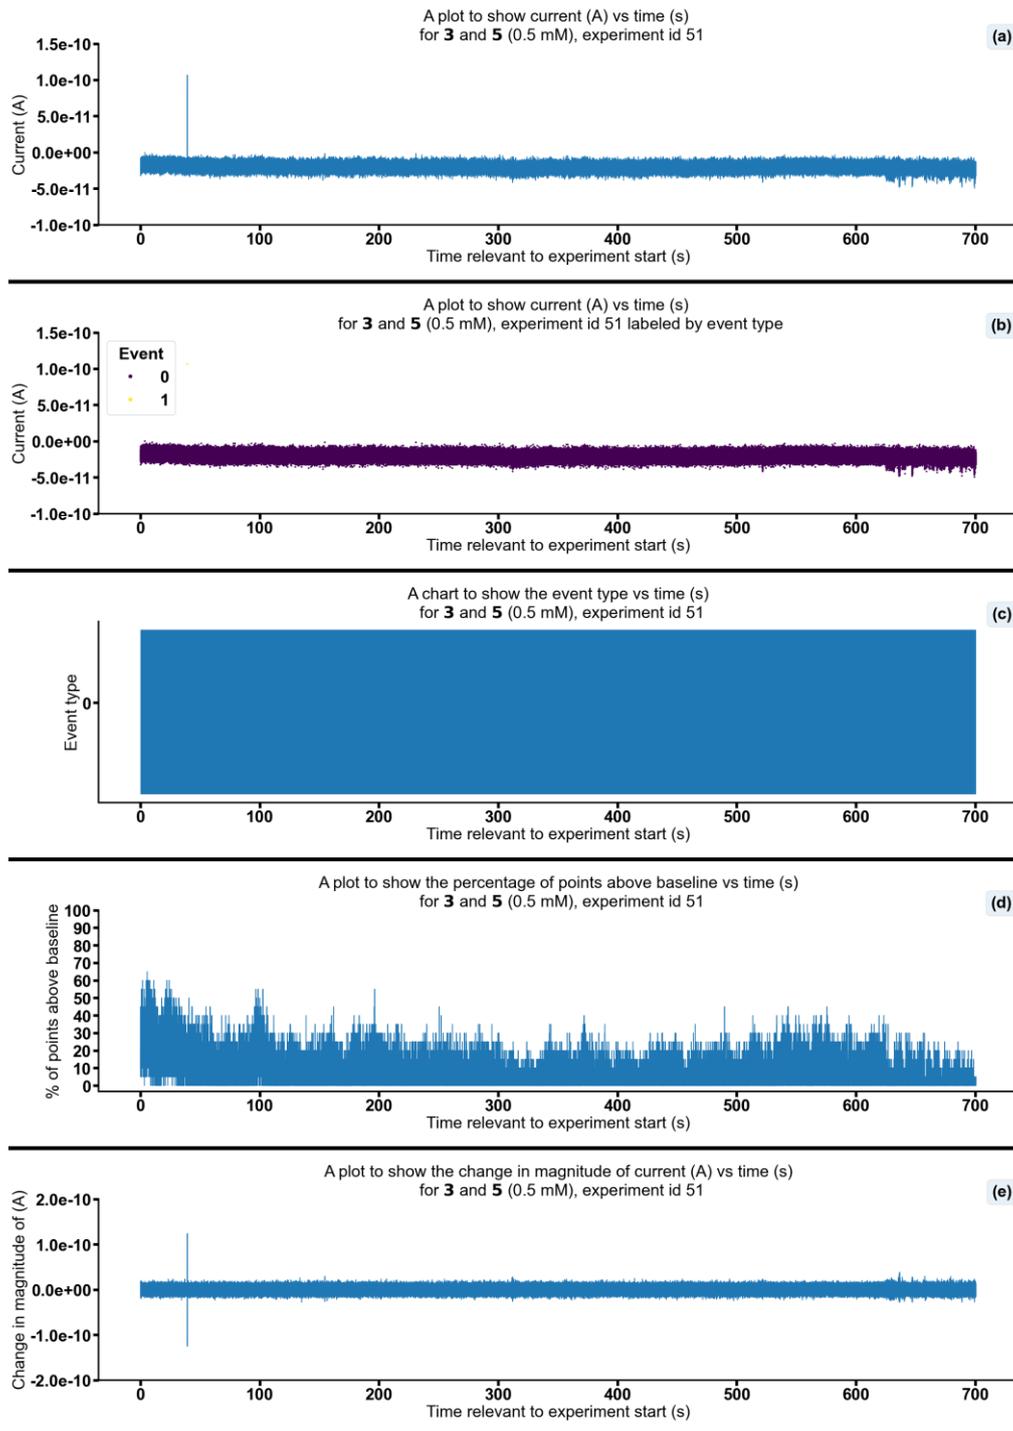

Figure S258 - Summarising the data from the patch clamp experiment for **3** and **5** (0.5 mM), experiment id 51 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.4 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

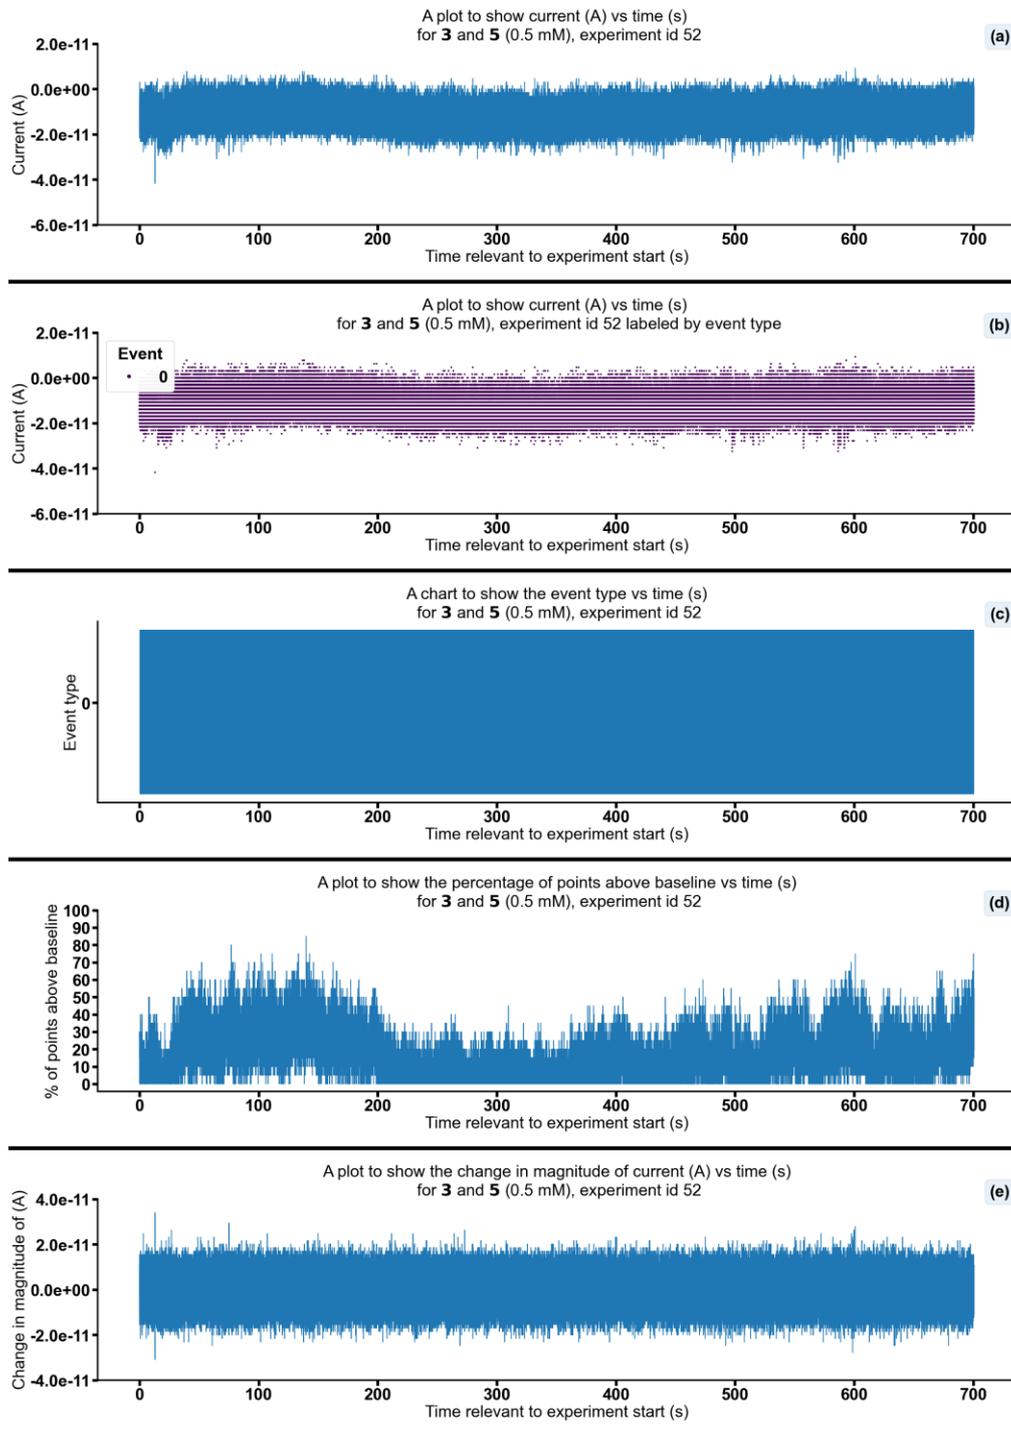

Figure S259 - Summarising the data from the patch clamp experiment for **3** and **5** (0.5 mM), experiment id 52 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event}$ 0 < $5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event}$ 1 < $5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event}$ 2 < $4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event}$ 3 < $\infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-7.6 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing the concentration of 7

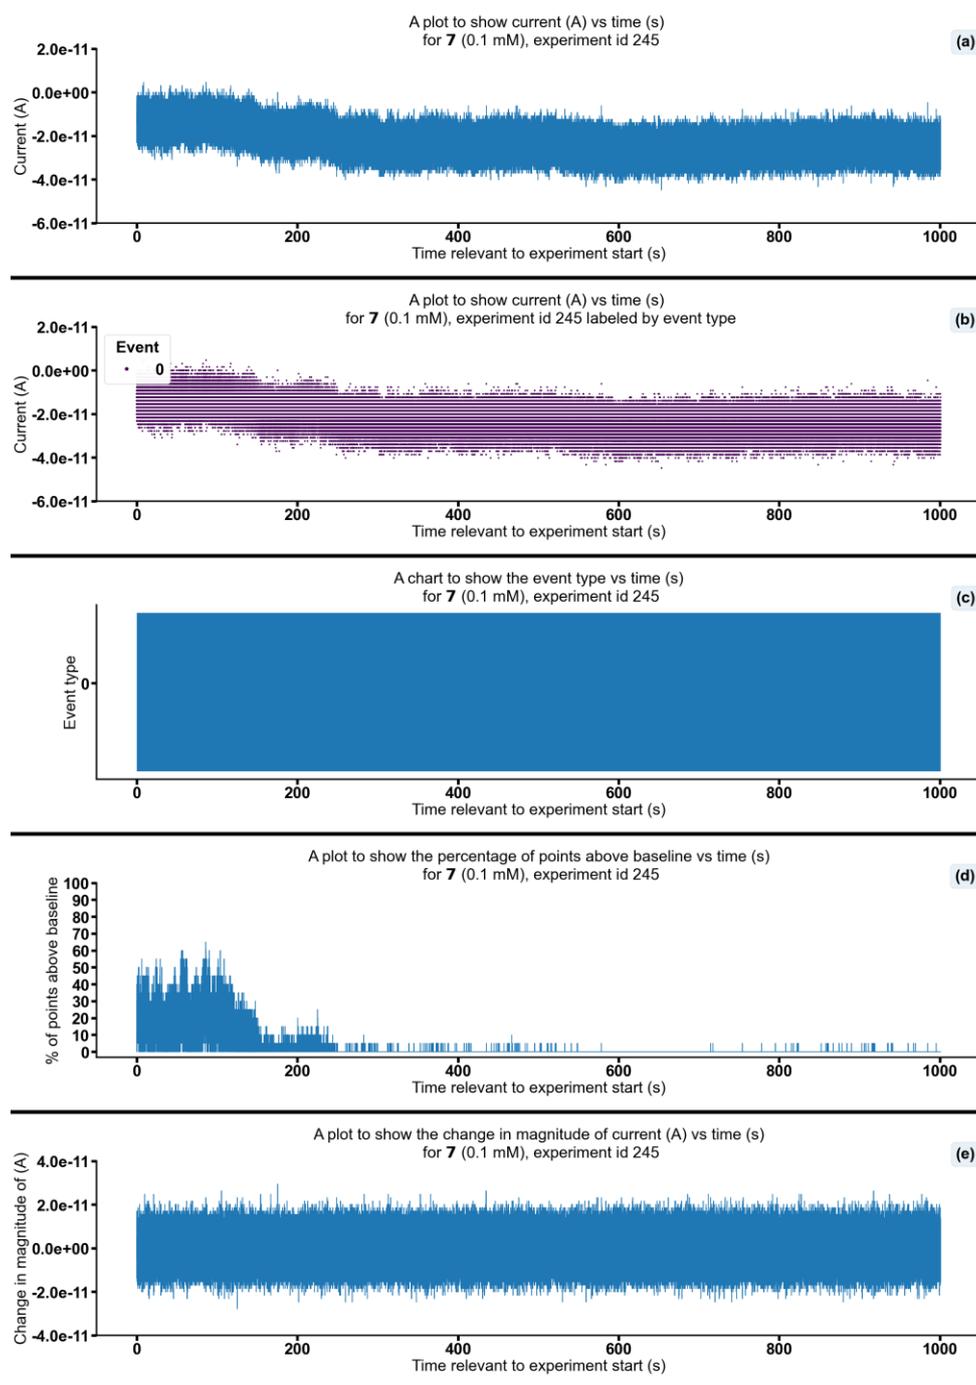

Figure S260 - Summarising the data from the patch clamp experiment for 7 (0.1 mM), experiment id 245 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.6 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

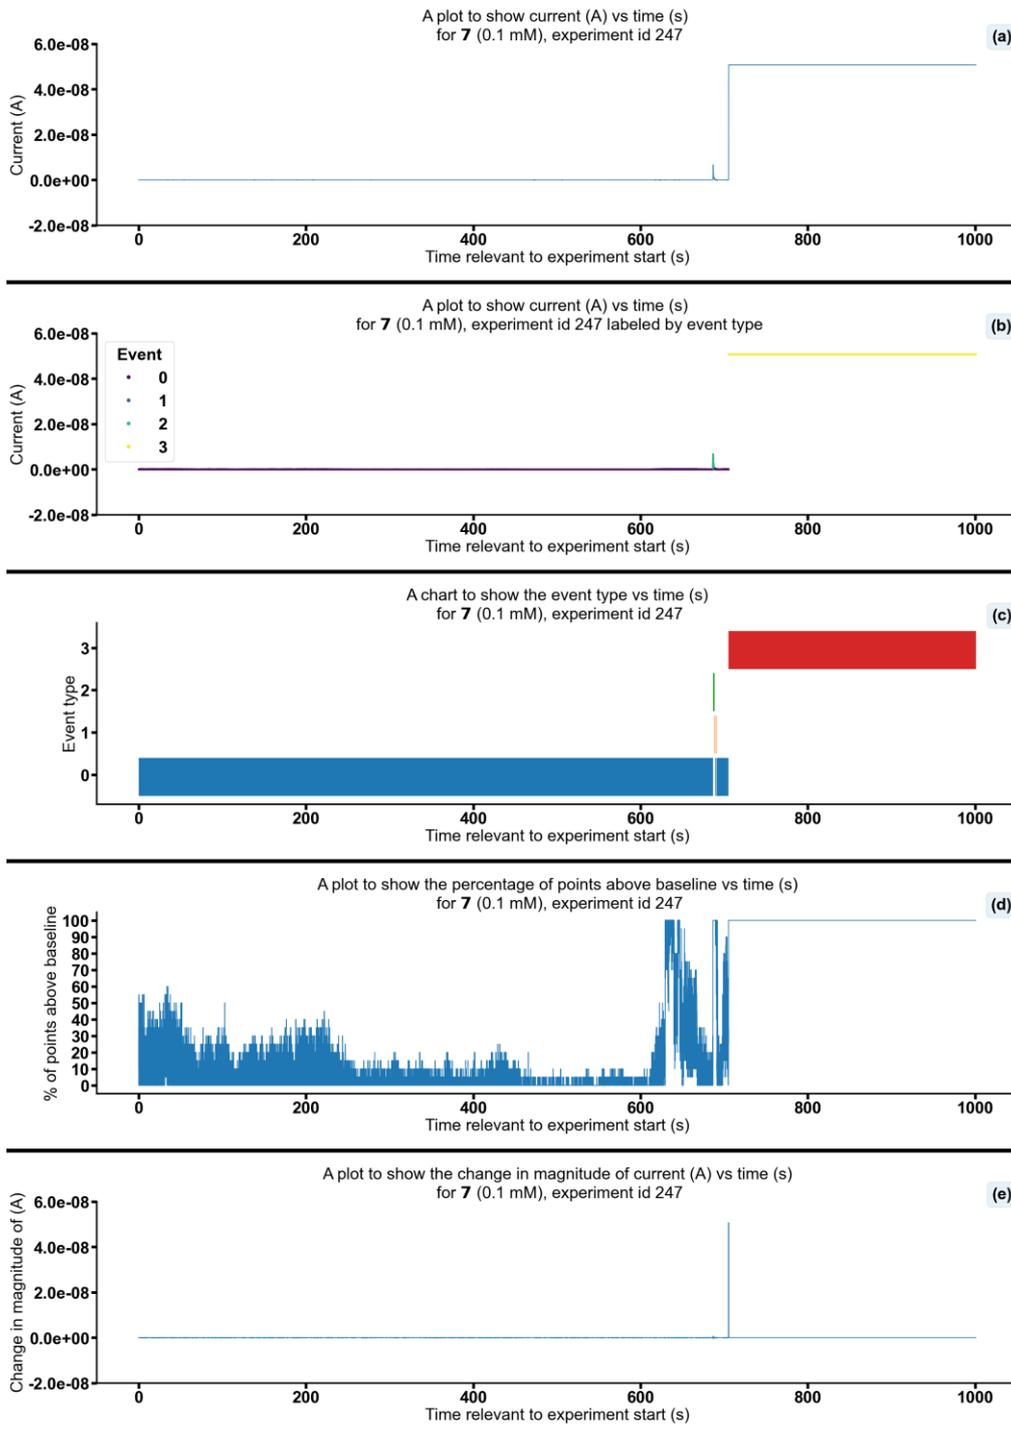

Figure S261 - Summarising the data from the patch clamp experiment for **7** (0.1 mM), experiment id 247 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-7.0 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

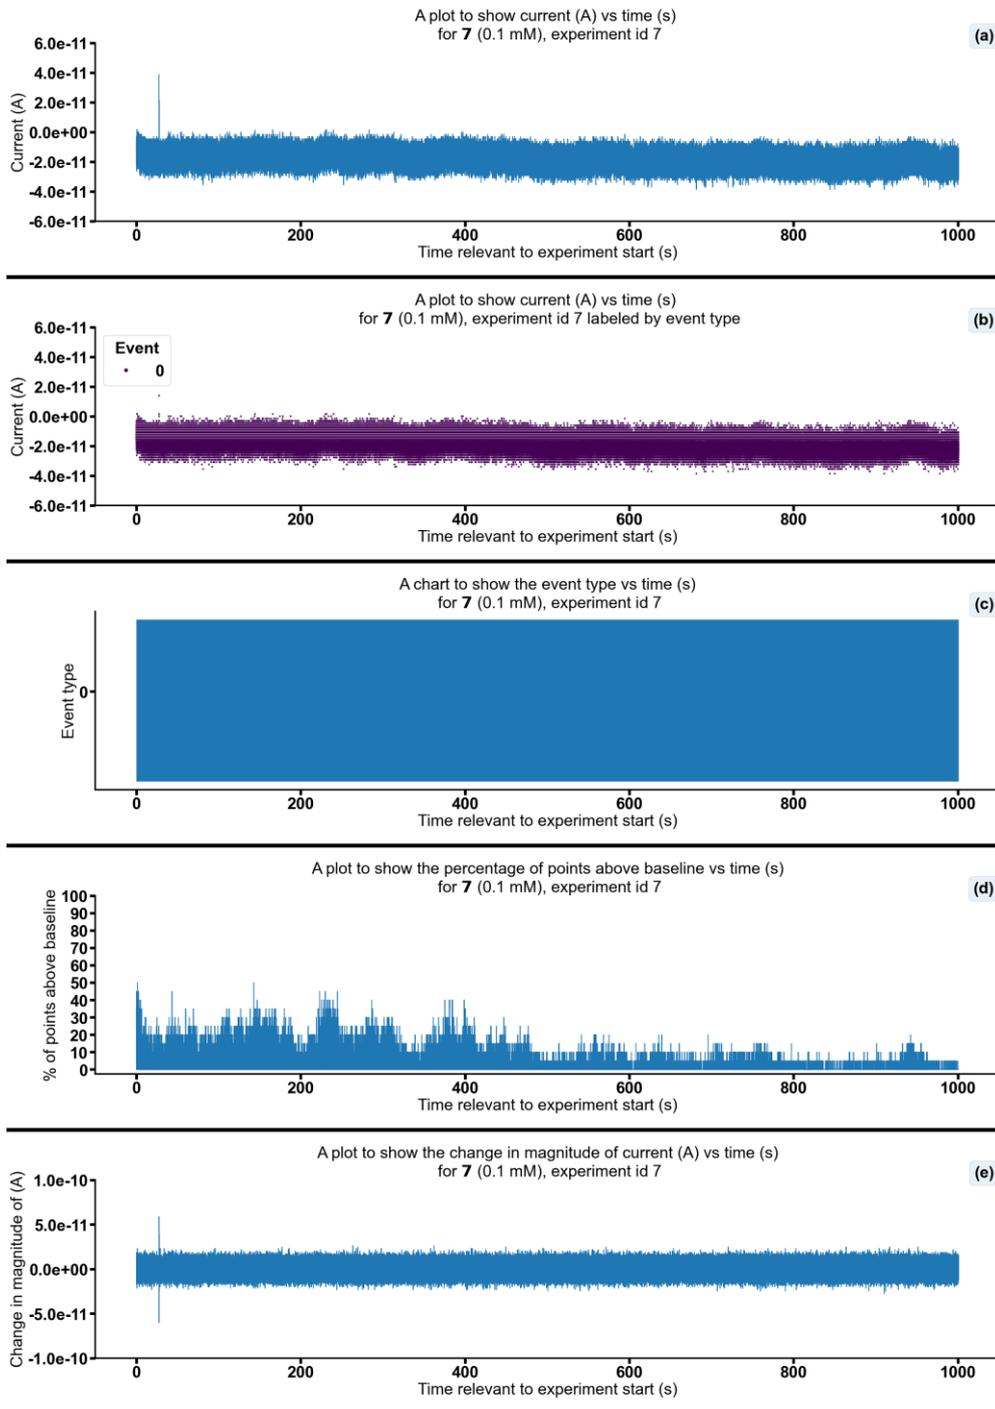

Figure S262 - Summarising the data from the patch clamp experiment for 7 (0.1 mM), experiment id 7 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.9 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

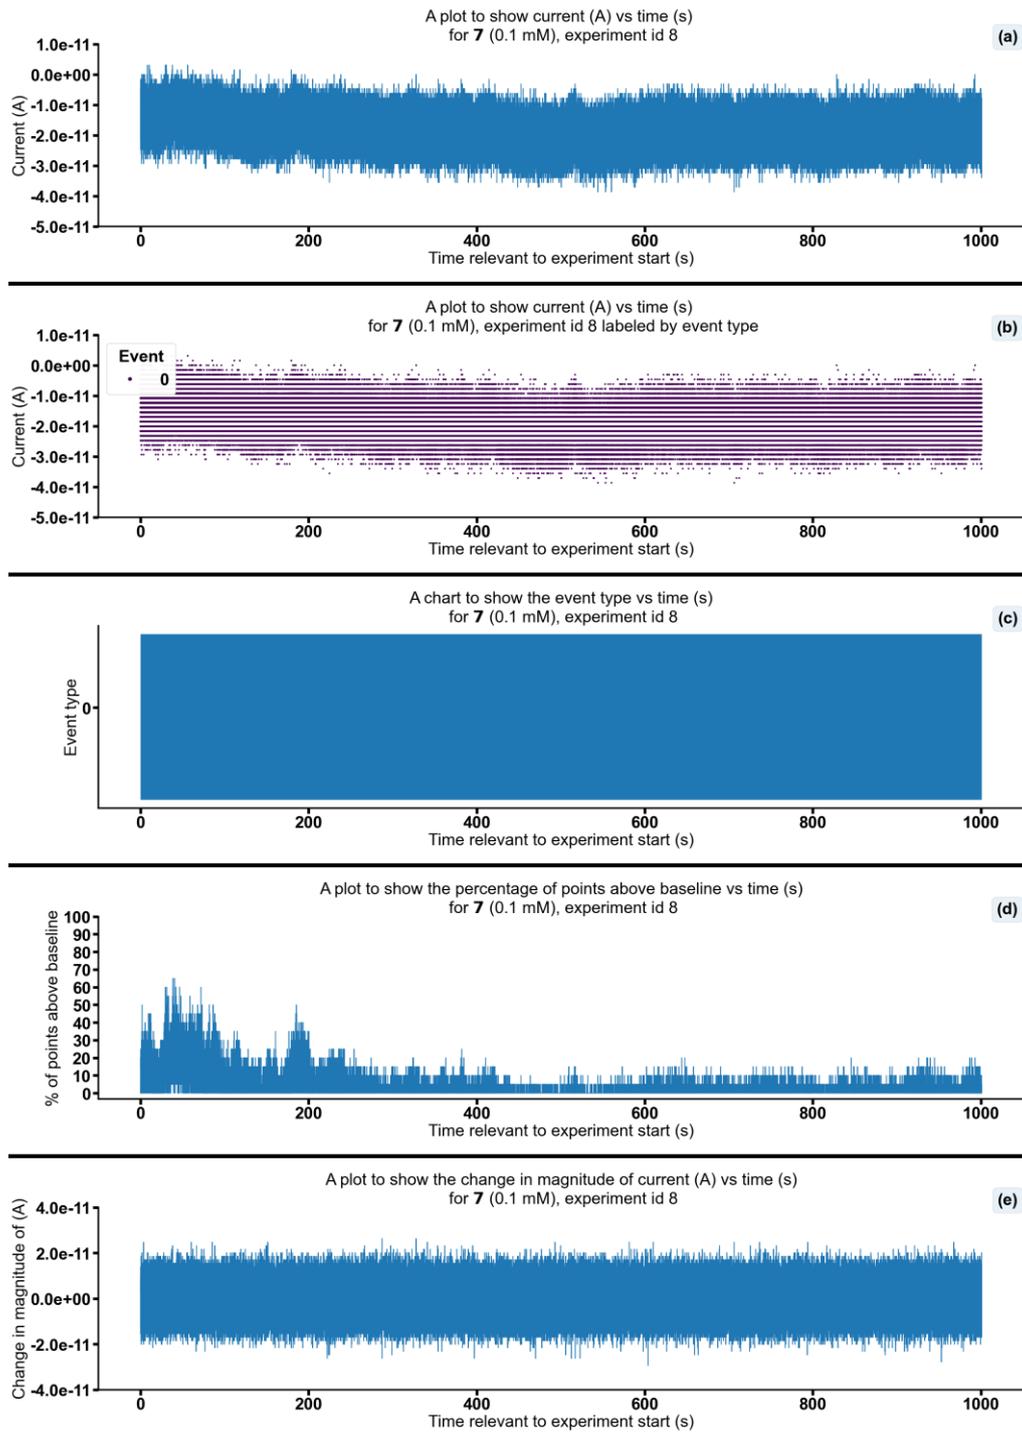

Figure S263 - Summarising the data from the patch clamp experiment for **7** (0.1 mM), experiment id 8 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.1 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

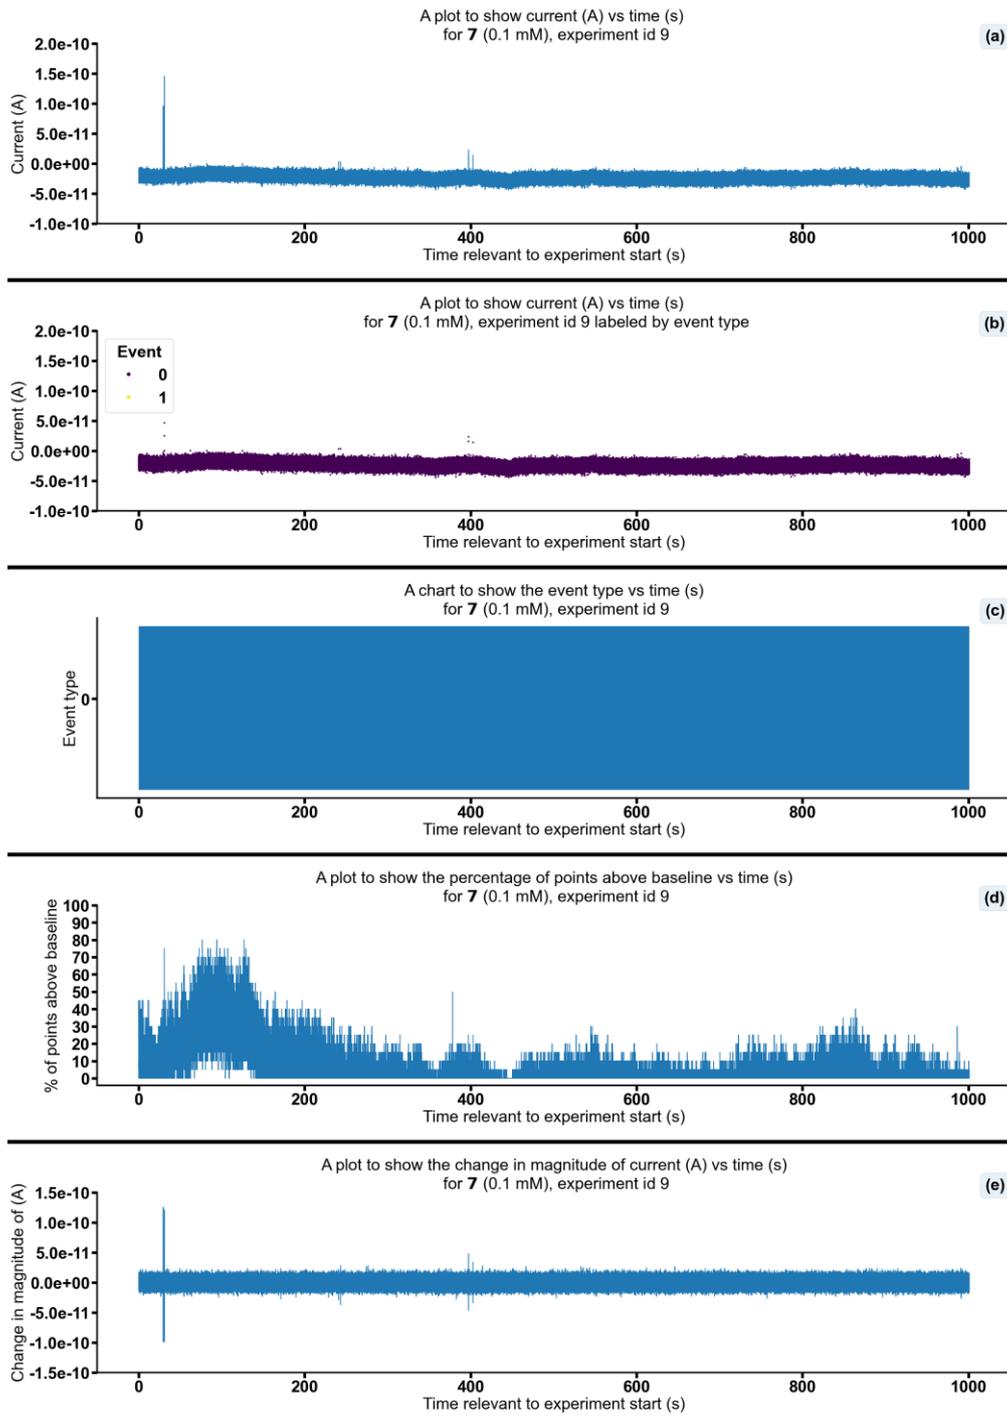

Figure S264- Summarising the data from the patch clamp experiment for 7 (0.1 mM), experiment id 9 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.6 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

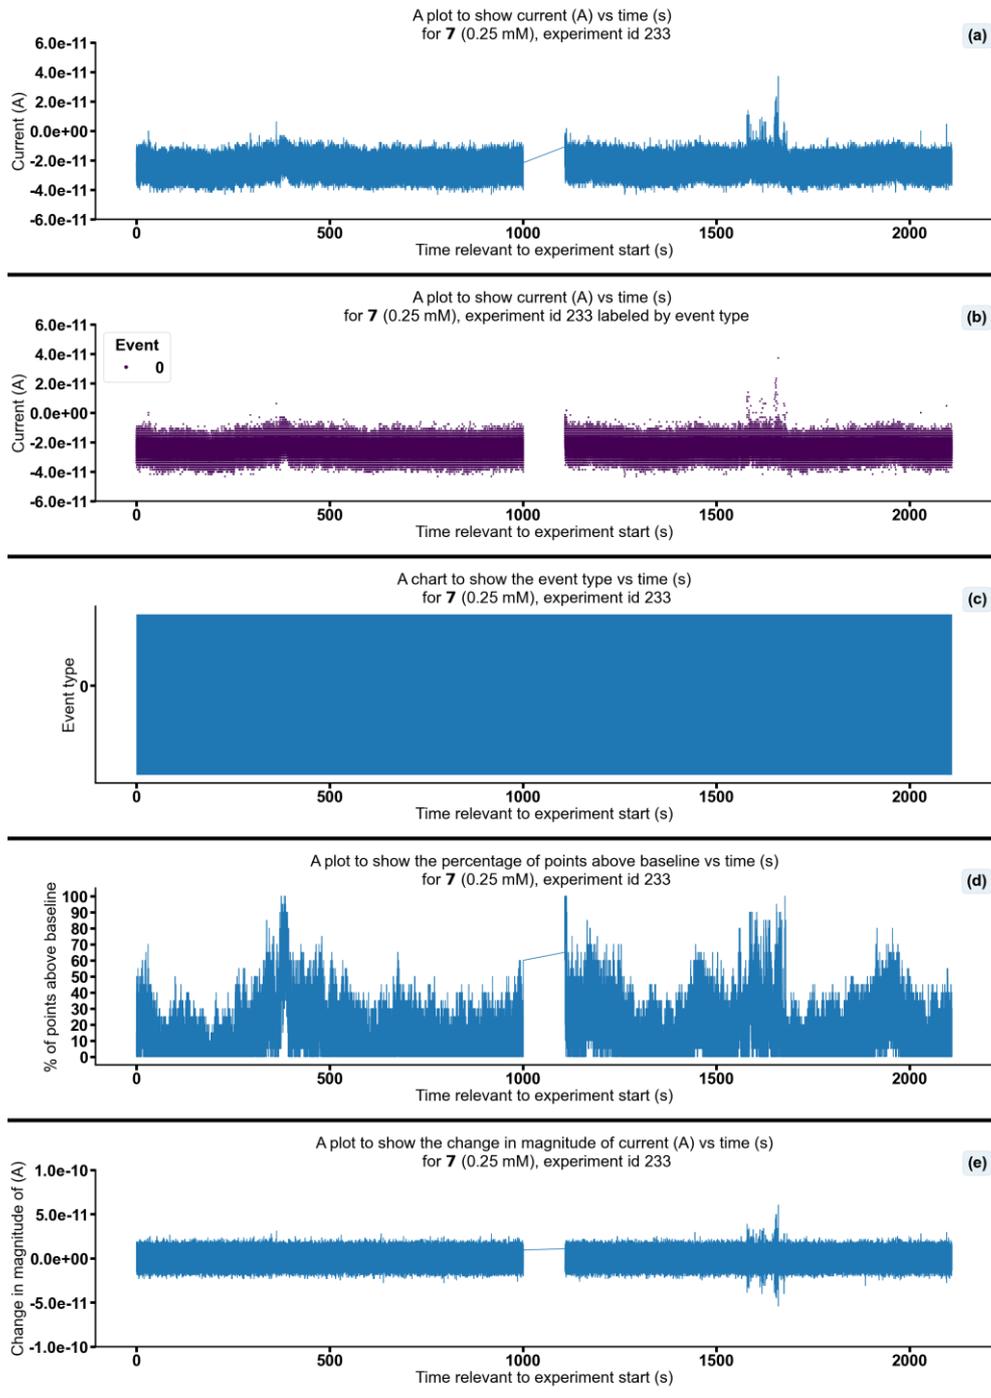

Figure S265 - Summarising the data from the patch clamp experiment for **7** (0.25 mM), experiment id 233 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.0 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

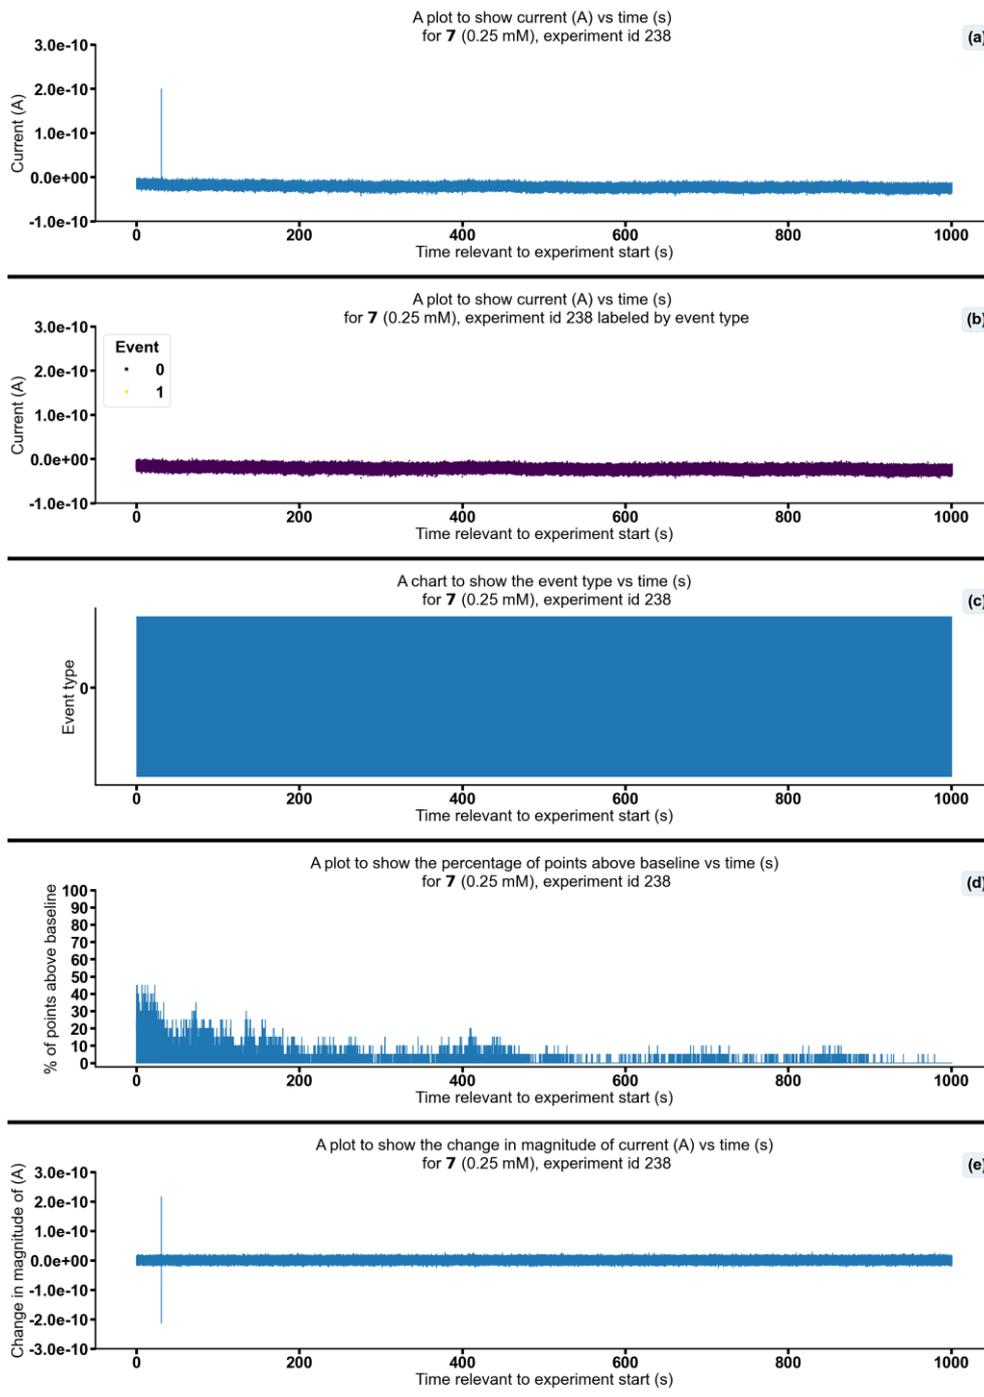

Figure S266 - Summarising the data from the patch clamp experiment for **7** (0.25 mM), experiment id 238 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00\text{e-}11 \text{ A}$, 1: $5.00\text{e-}11 \text{ A} \leq \text{Event 1} < 5.00\text{e-}10 \text{ A}$, 2: $5.00\text{e-}10 \text{ A} \leq \text{Event 2} < 4.90\text{e-}08 \text{ A}$, 3: $4.90\text{e-}08 \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.1\text{e-}11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

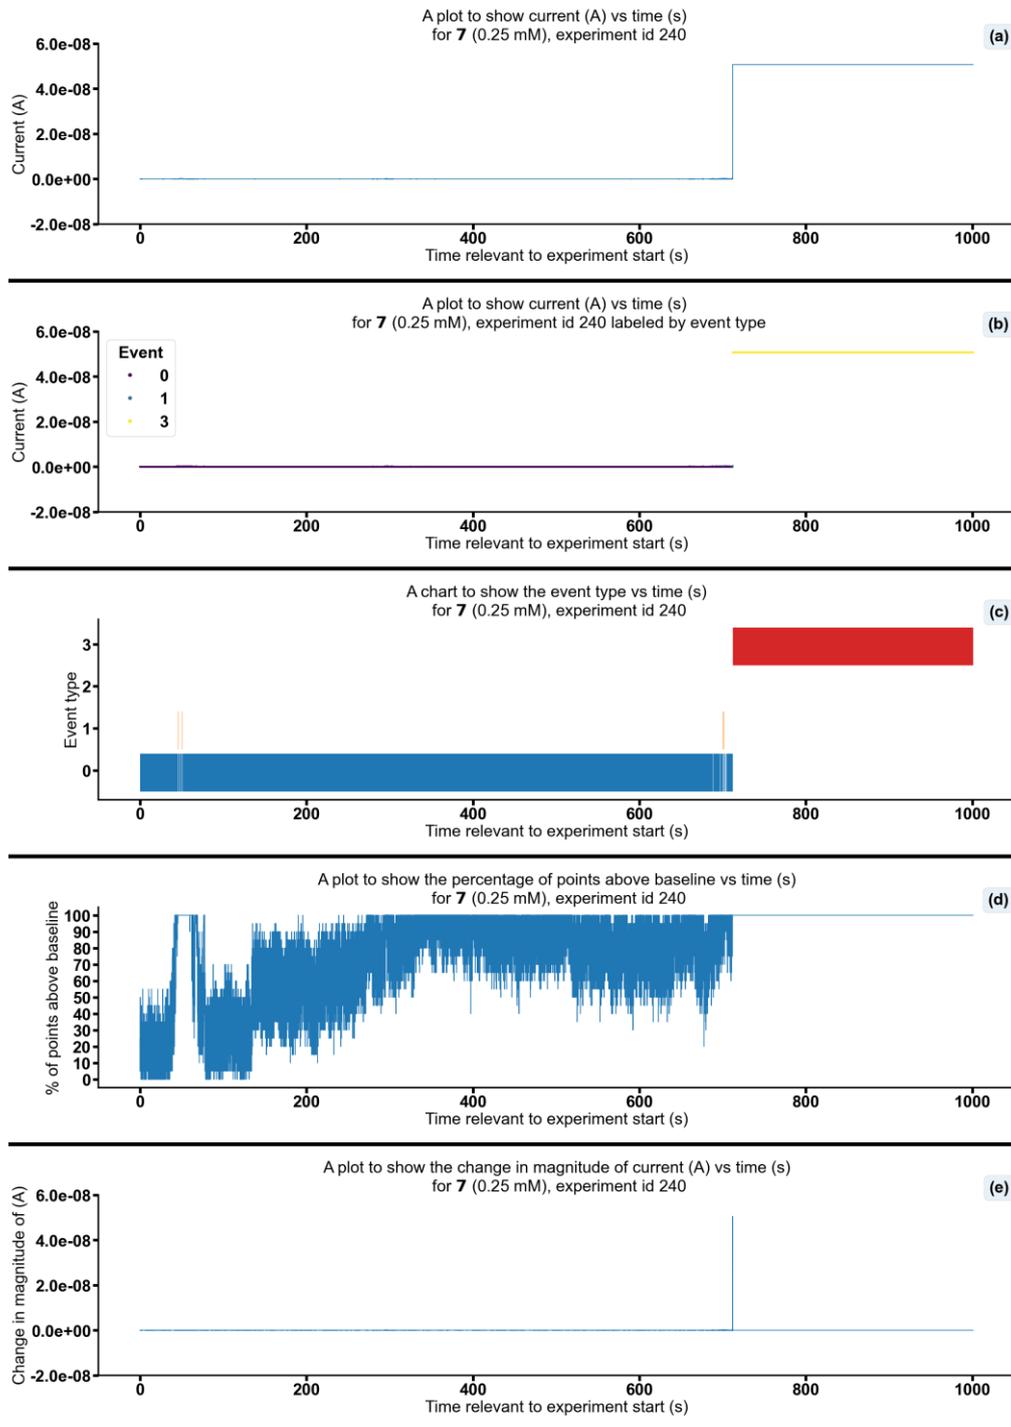

Figure S267 - Summarising the data from the patch clamp experiment for **7** (0.25 mM), experiment id 240 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.3 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

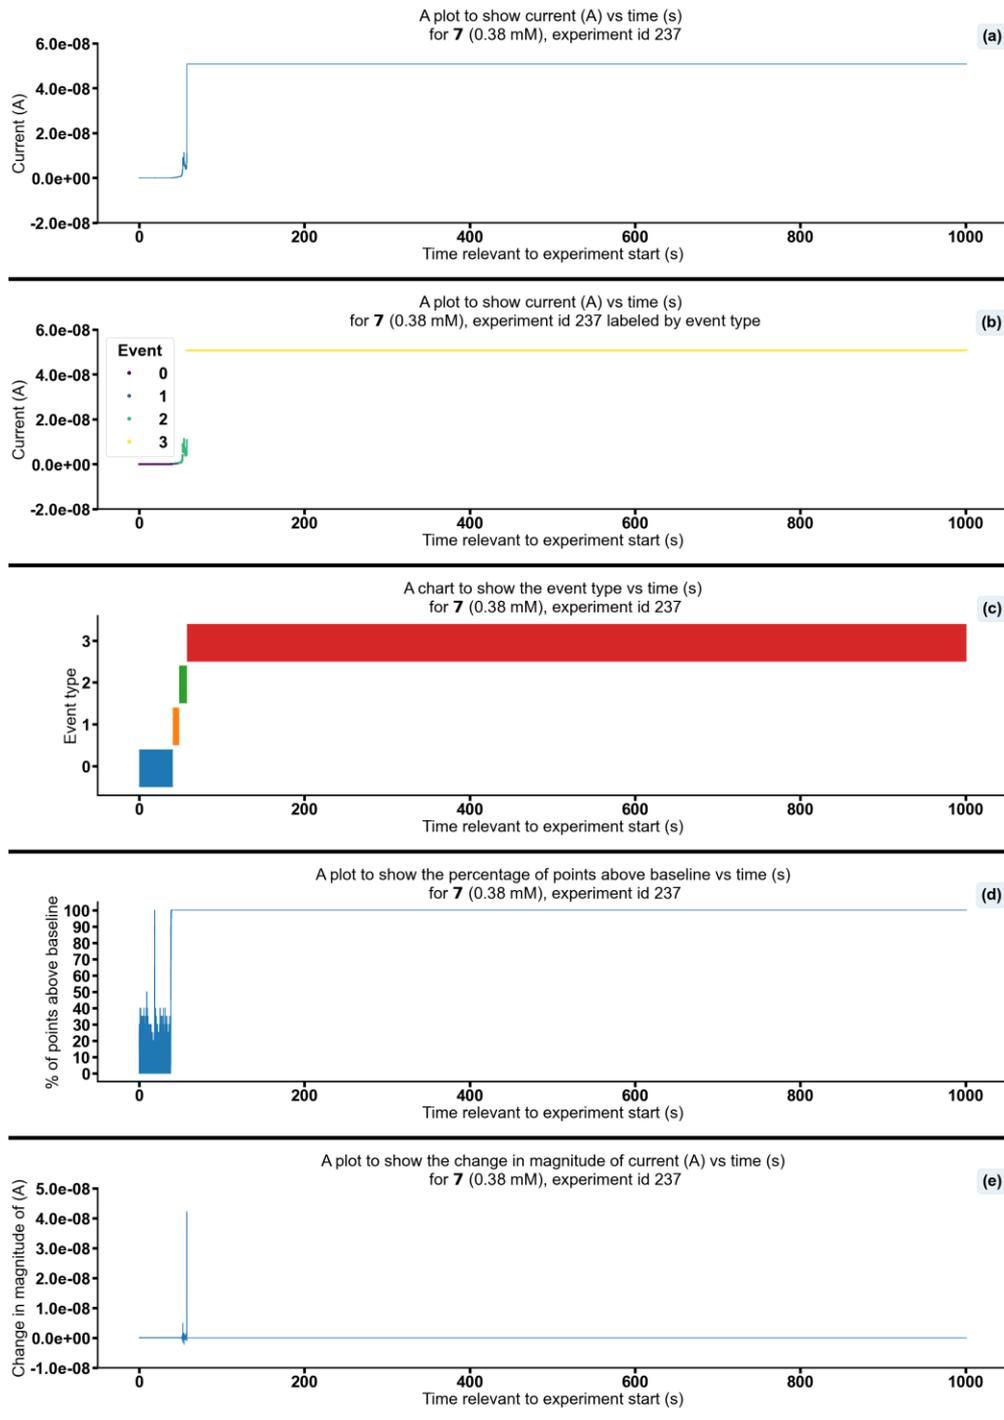

Figure S268 - Summarising the data from the patch clamp experiment for **7** (0.38 mM), experiment id 237 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00\text{e-}11 \text{ A}$, 1: $5.00\text{e-}11 \text{ A} \leq \text{Event 1} < 5.00\text{e-}10 \text{ A}$, 2: $5.00\text{e-}10 \text{ A} \leq \text{Event 2} < 4.90\text{e-}08 \text{ A}$, 3: $4.90\text{e-}08 \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.5\text{e-}11 \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

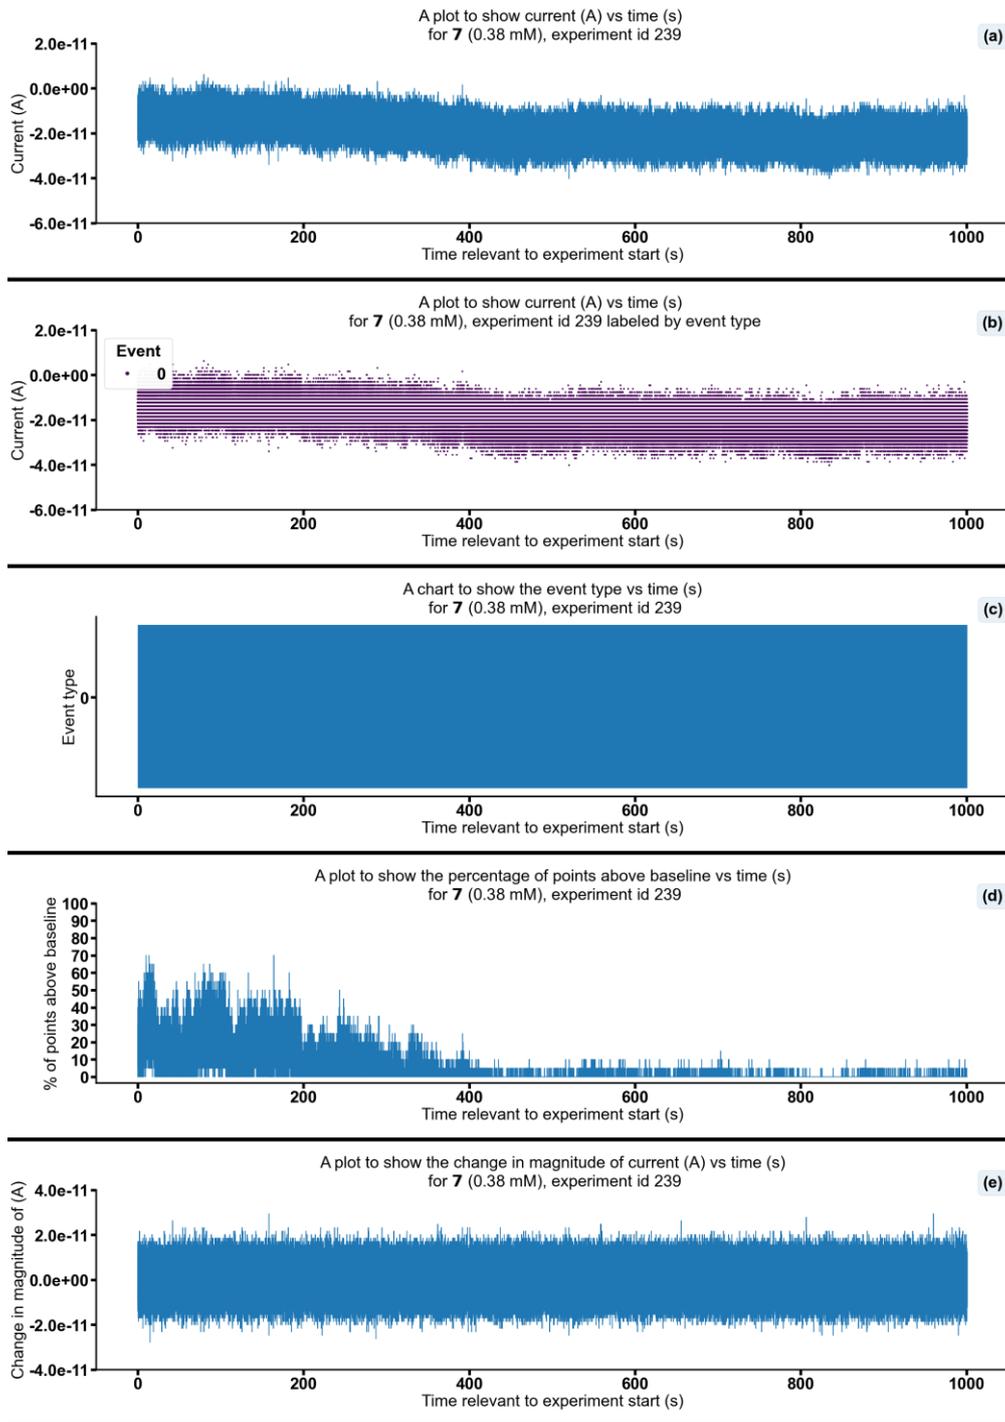

Figure S269 - Summarising the data from the patch clamp experiment for **7** (0.38 mM), experiment id 239 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.5 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

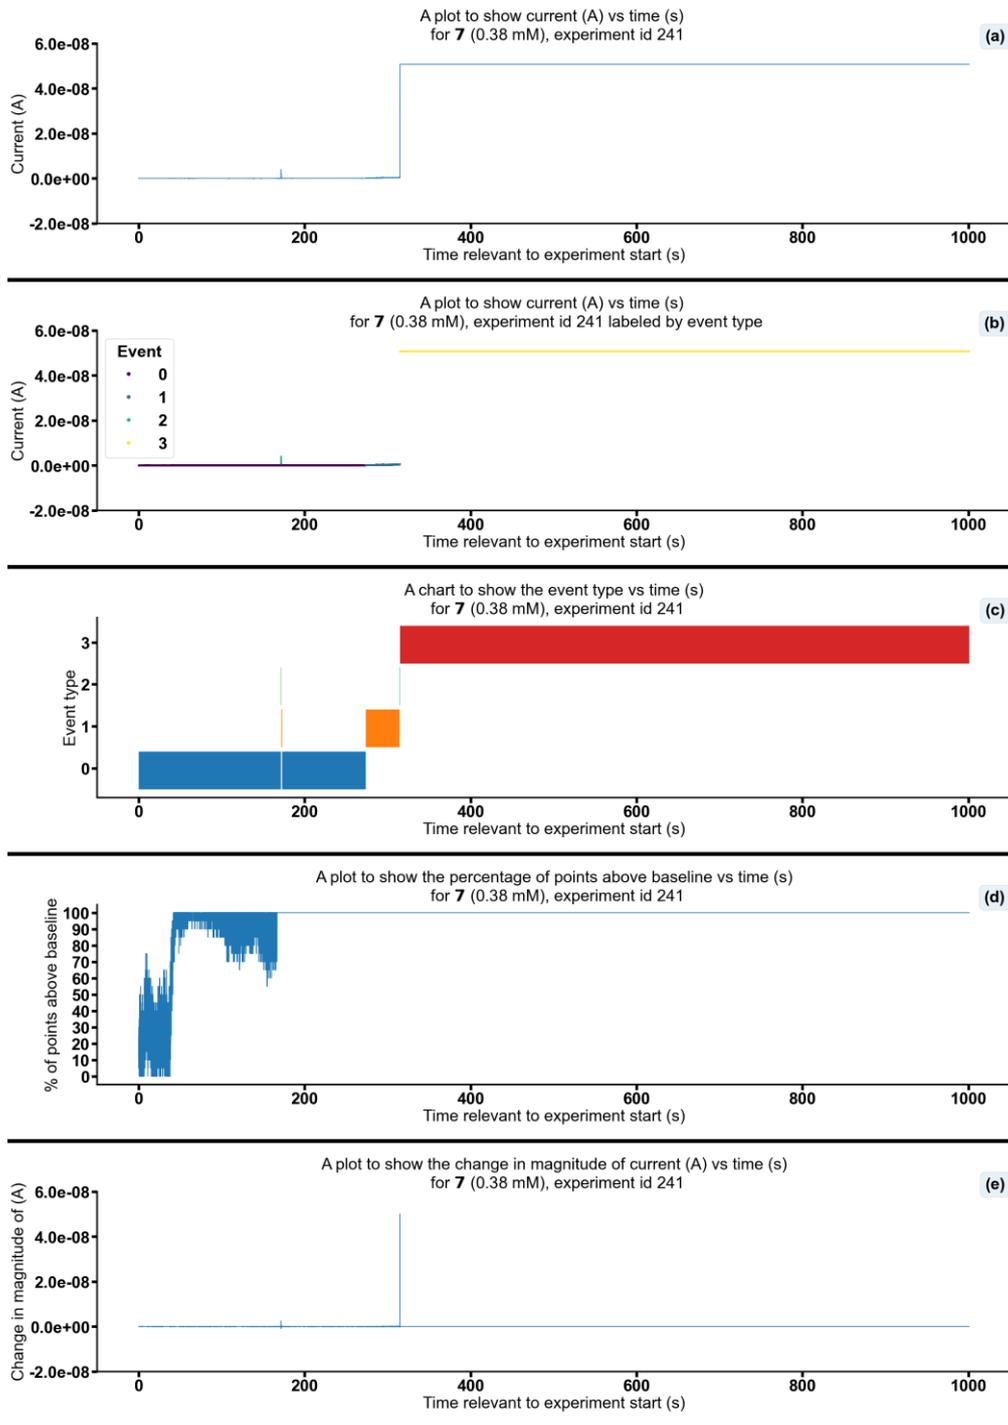

Figure S270 - Summarising the data from the patch clamp experiment for **7** (0.38 mM), experiment id 241 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.1 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

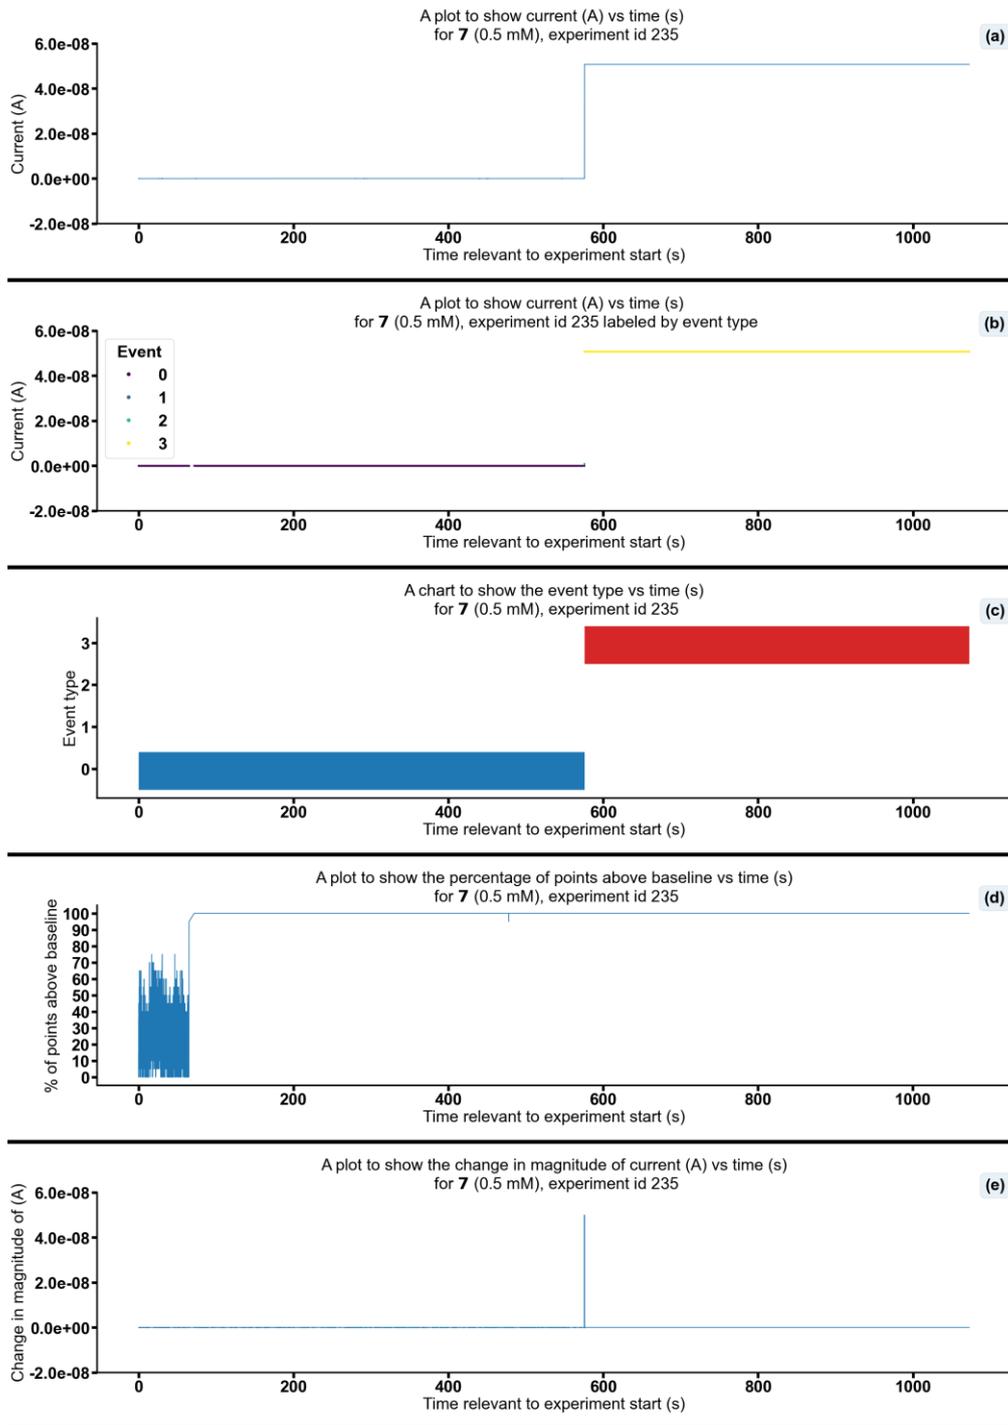

Figure S271 - Summarising the data from the patch clamp experiment for 7 (0.5 mM), experiment id 235 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-4.5 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

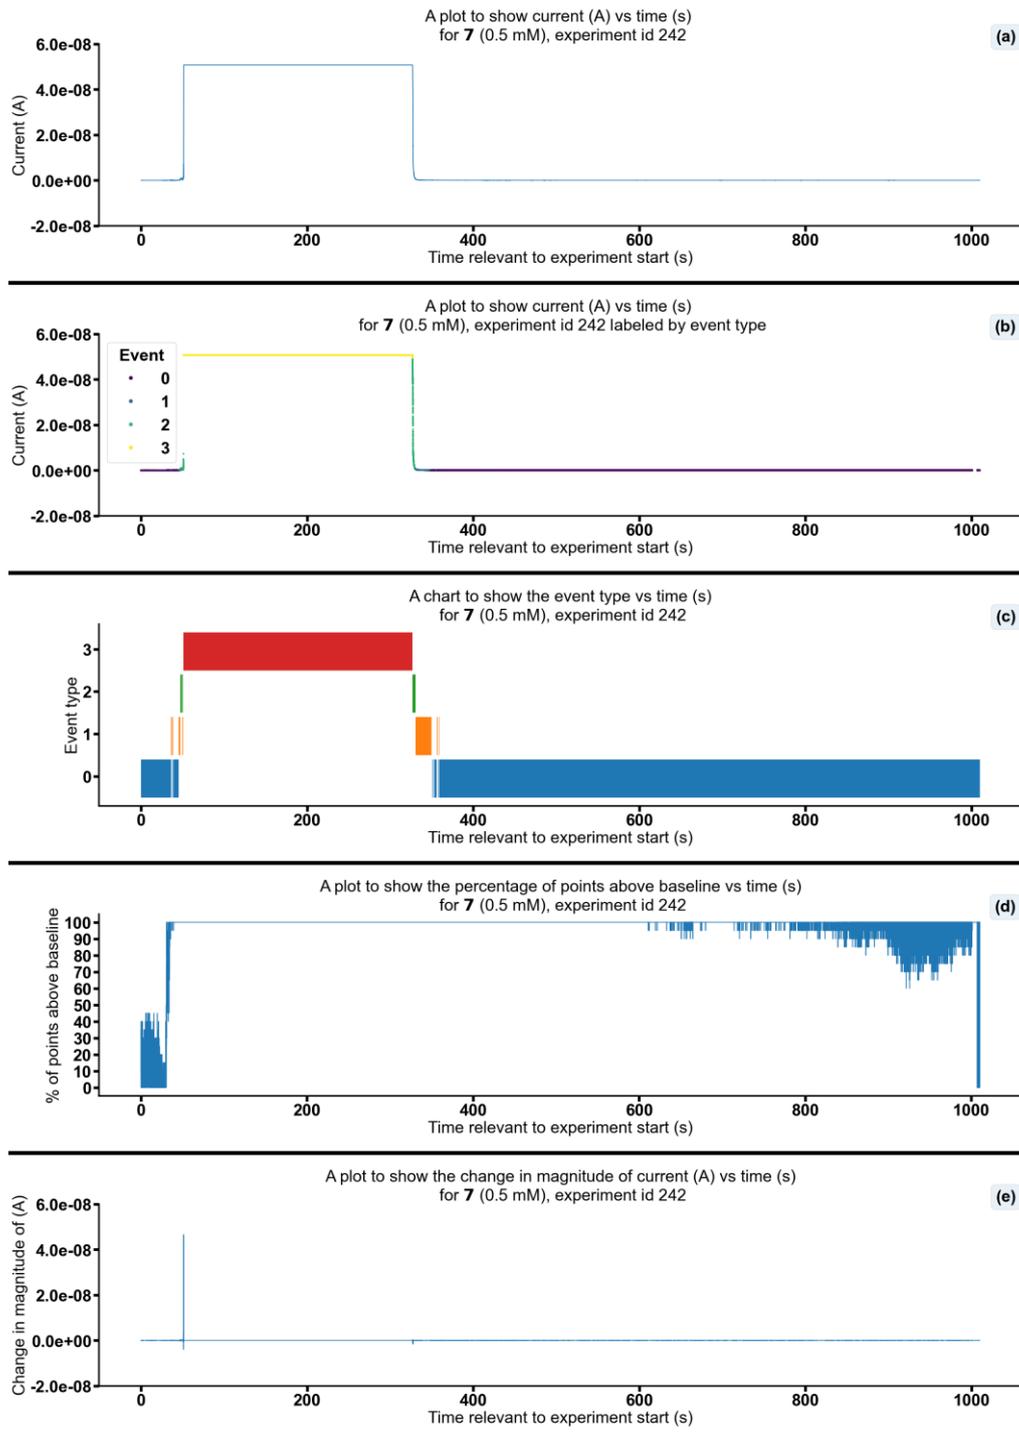

Figure S272 - Summarising the data from the patch clamp experiment for **7** (0.5 mM), experiment id 242 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-9.4 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

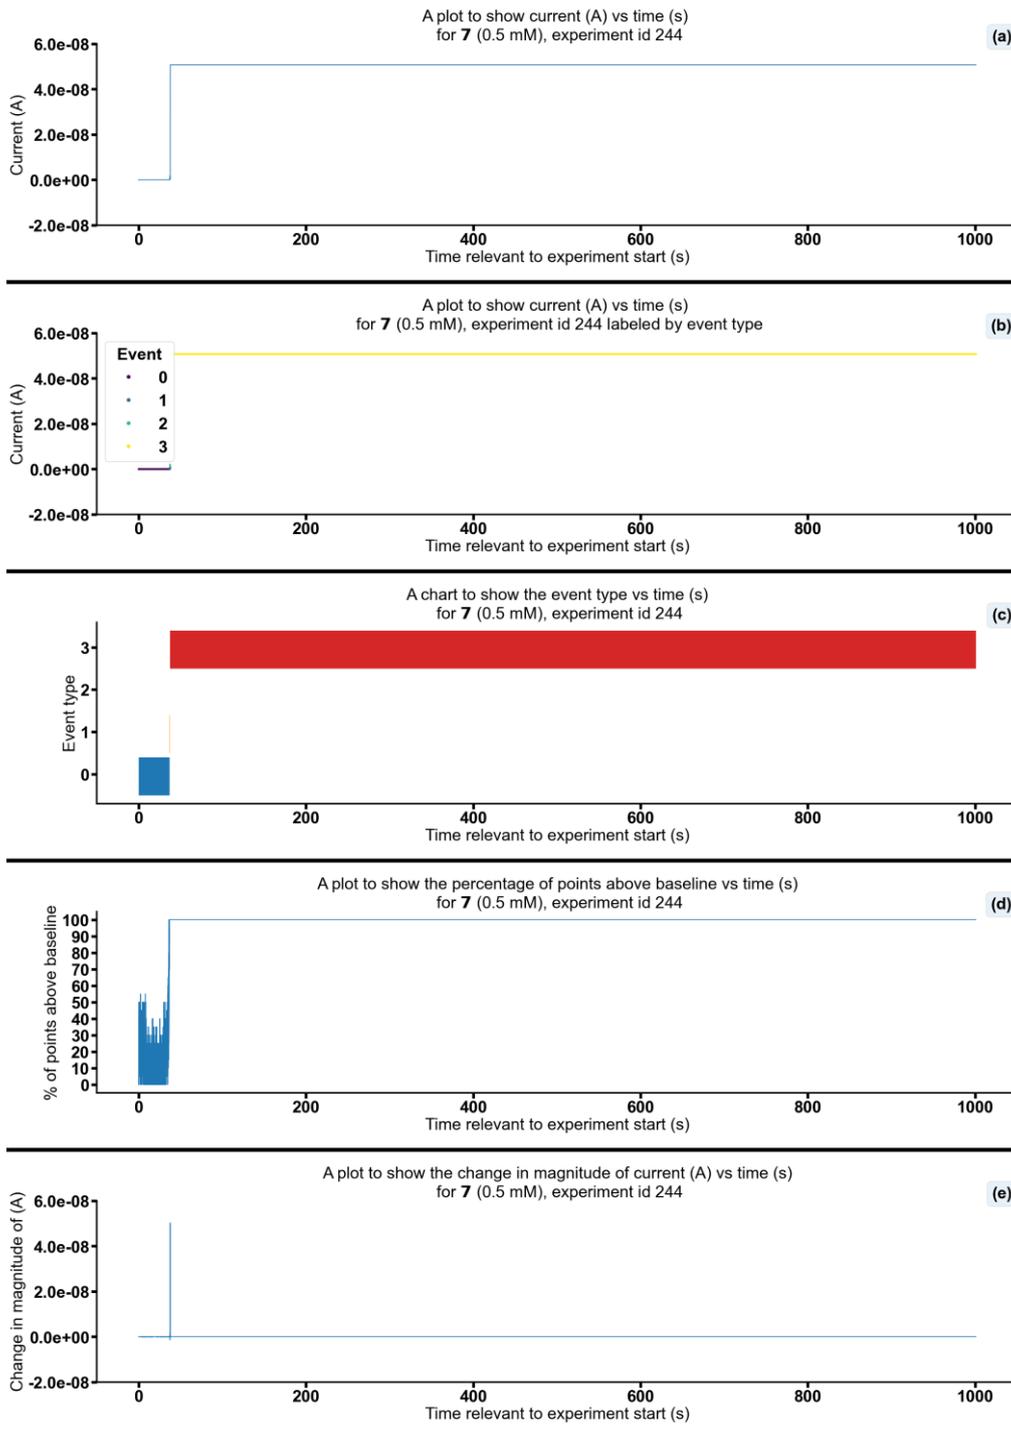

Figure S273 - Summarising the data from the patch clamp experiment for 7 (0.5 mM), experiment id 244 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq$ Event 0 $< 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq$ Event 1 $< 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq$ Event 2 $< 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq$ Event 3 $< \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.5 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

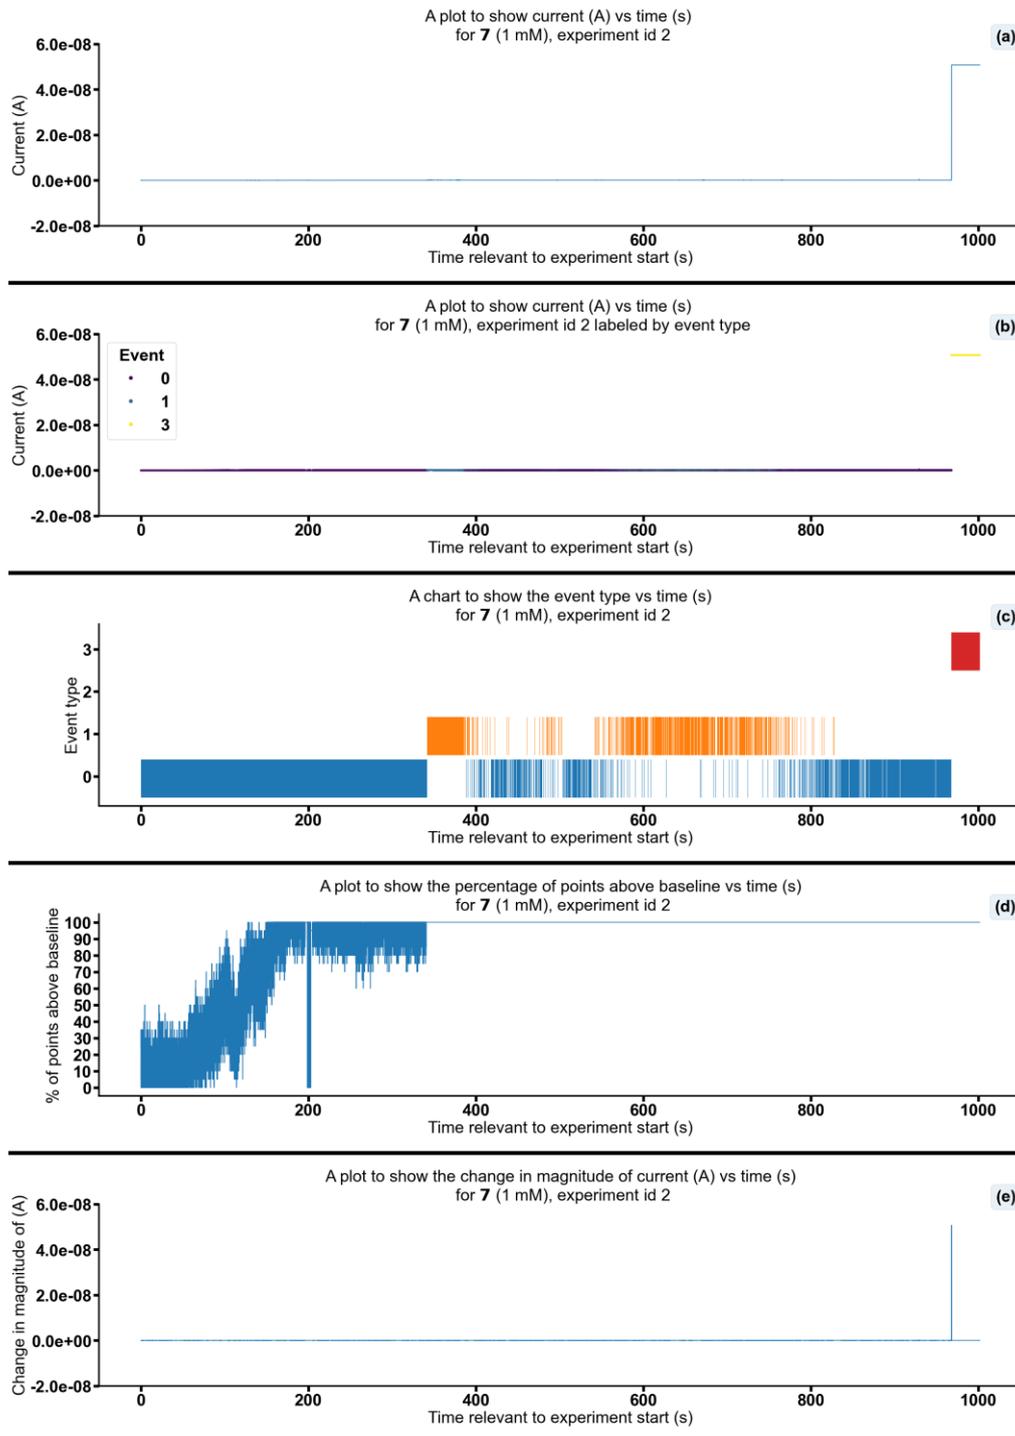

Figure S274 - Summarising the data from the patch clamp experiment for 7 (1 mM), experiment id 2 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

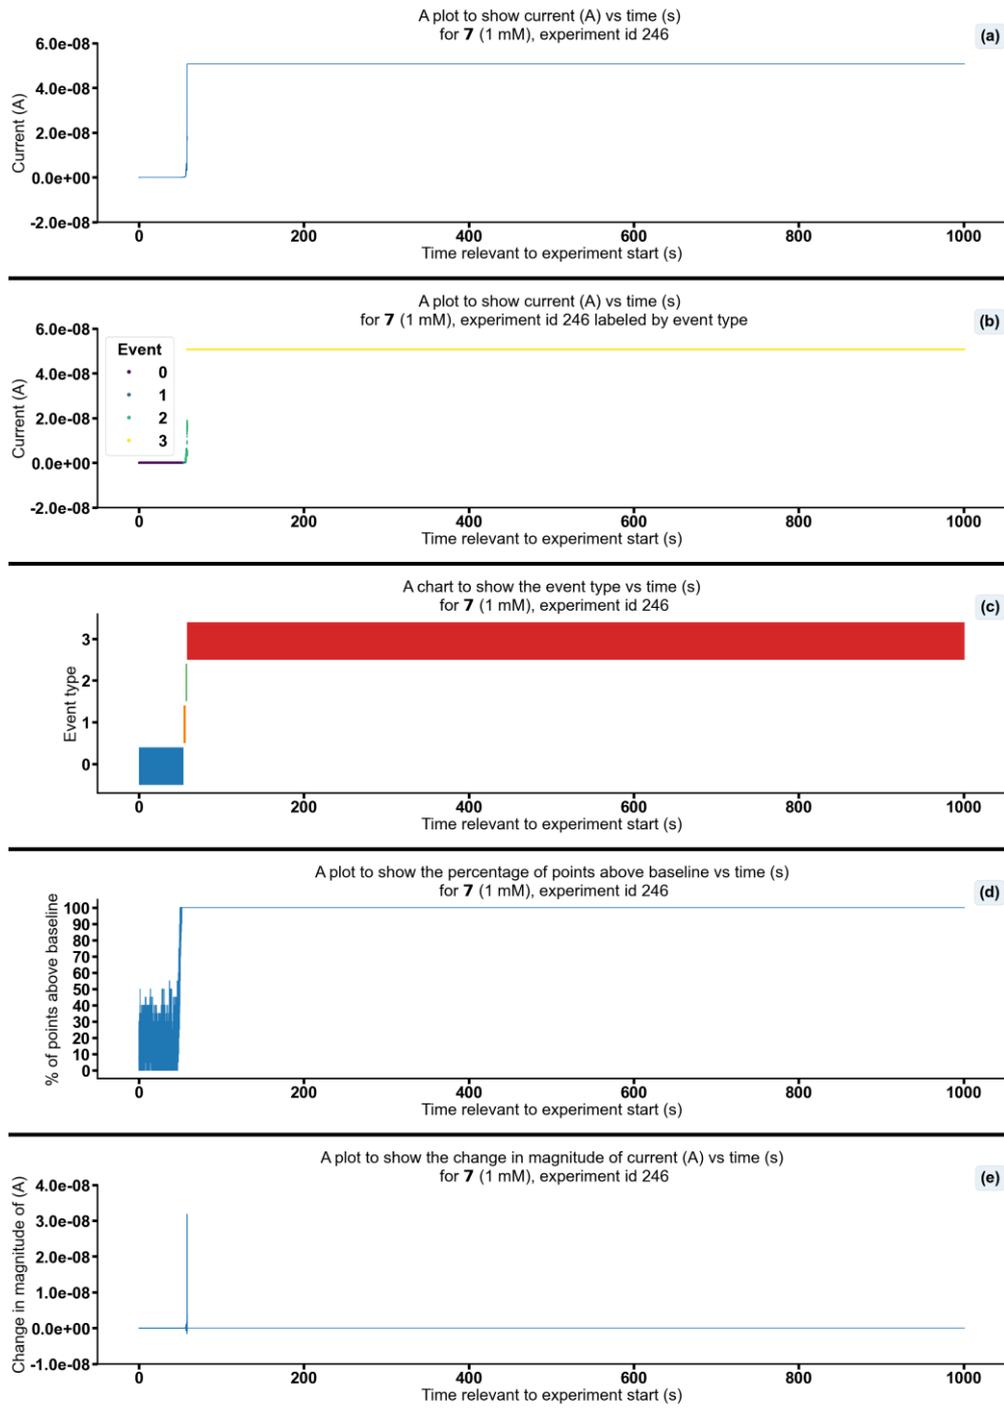

Figure S275 - Summarising the data from the patch clamp experiment for **7** (1 mM), experiment id 246 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-3.1 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

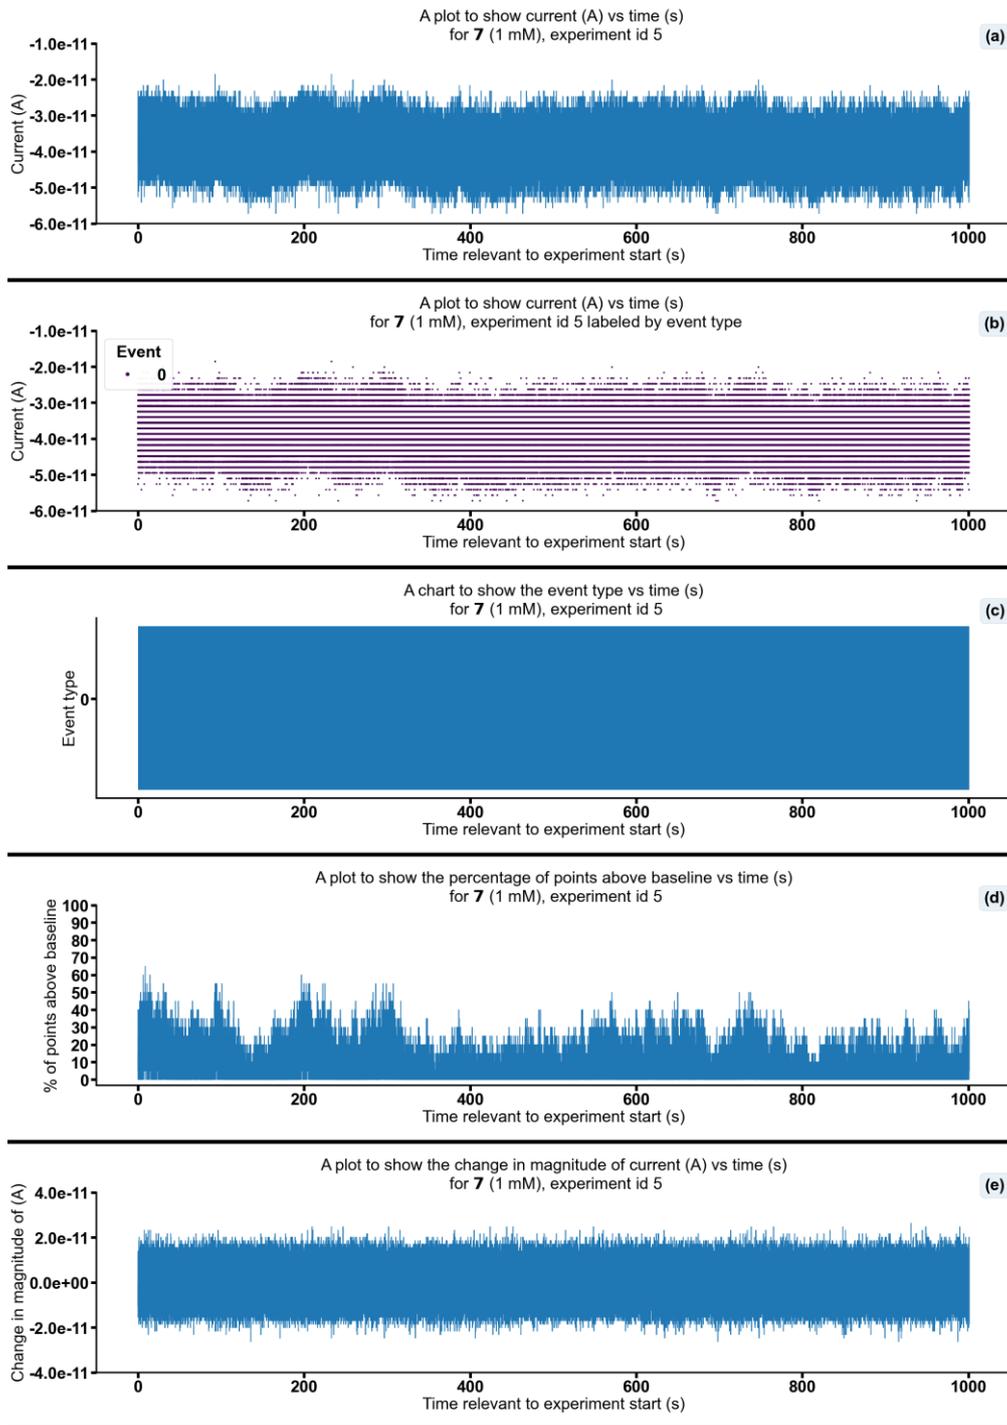

Figure S276 - Summarising the data from the patch clamp experiment for 7 (1 mM), experiment id 5 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-3.3 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

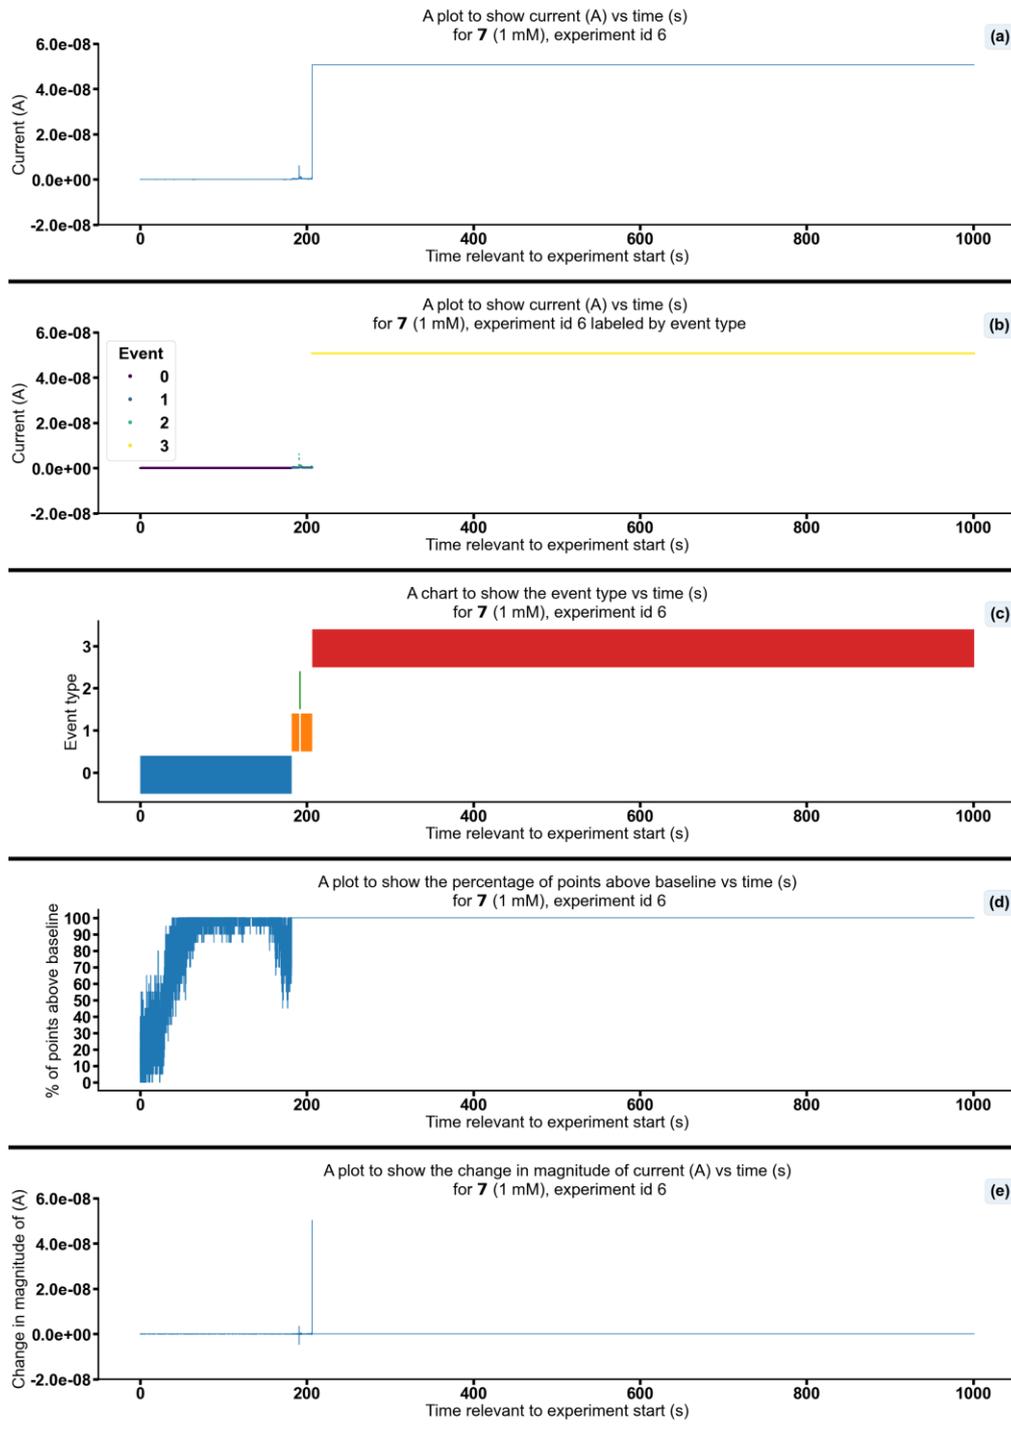

Figure S277 - Summarising the data from the patch clamp experiment for 7 (1 mM), experiment id 6 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-4.7 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing the concentration of 9

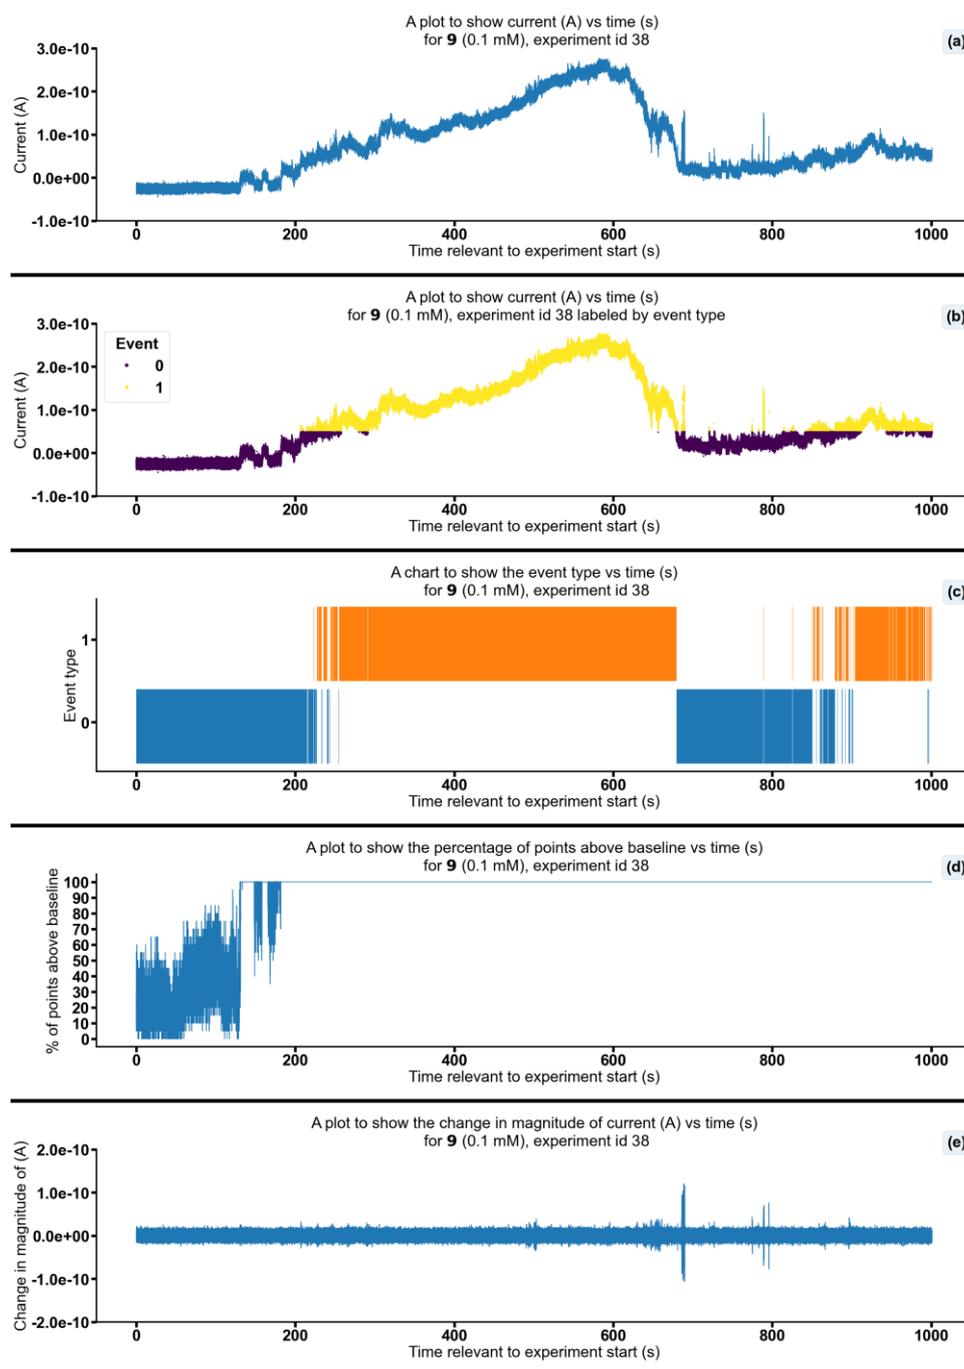

Figure S278 - Summarising the data from the patch clamp experiment for 9 (0.1 mM), experiment id 38 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -2.2×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

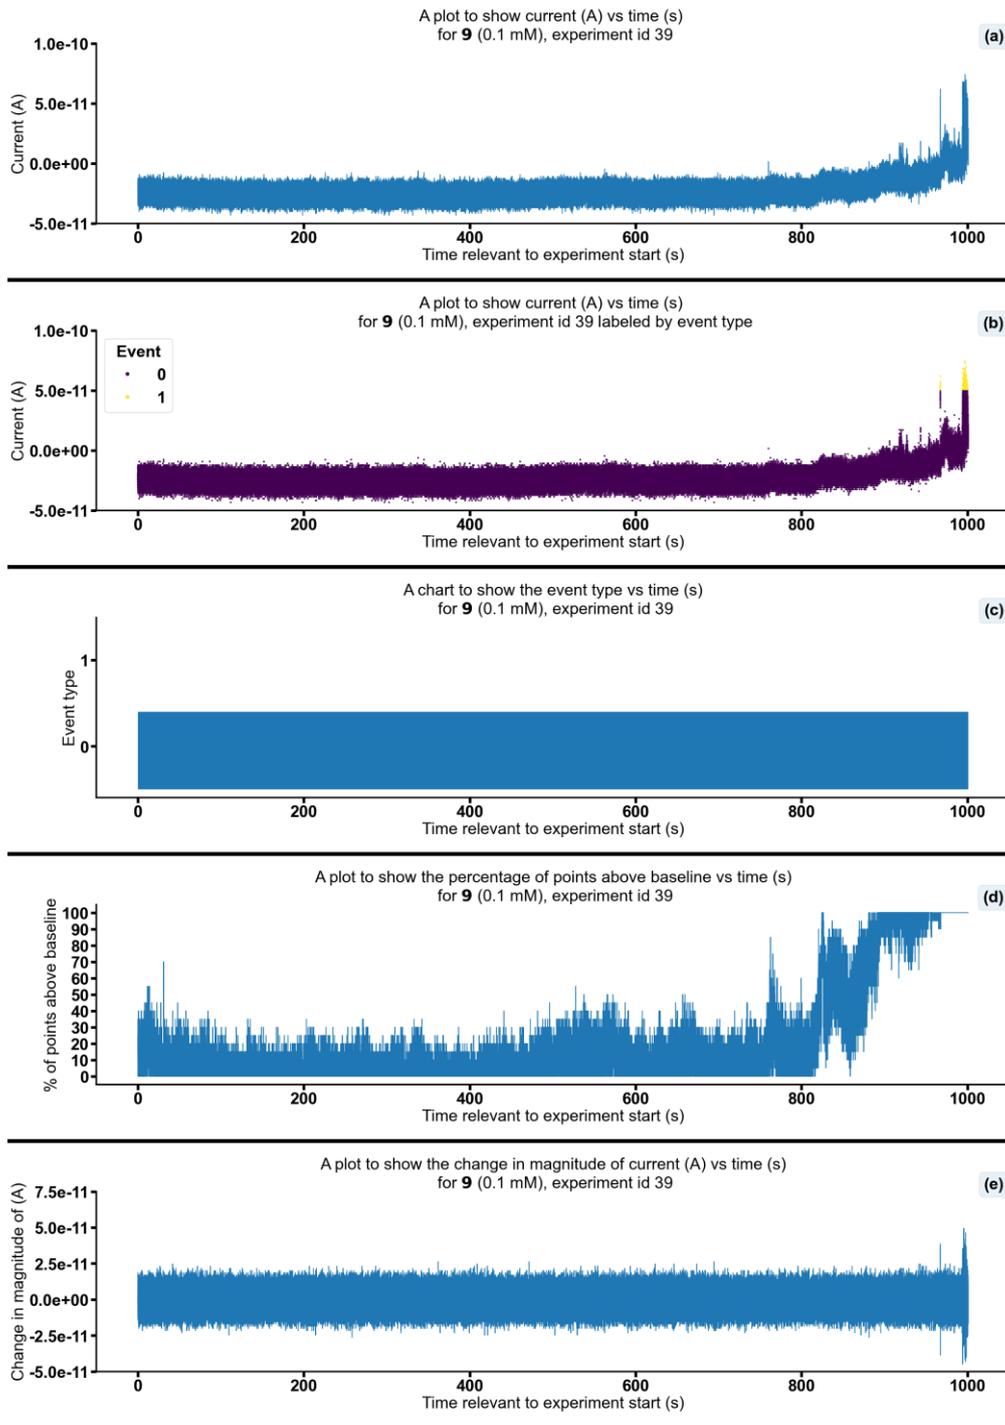

Figure S279 - Summarising the data from the patch clamp experiment for **9** (0.1 mM), experiment id 39 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.9×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

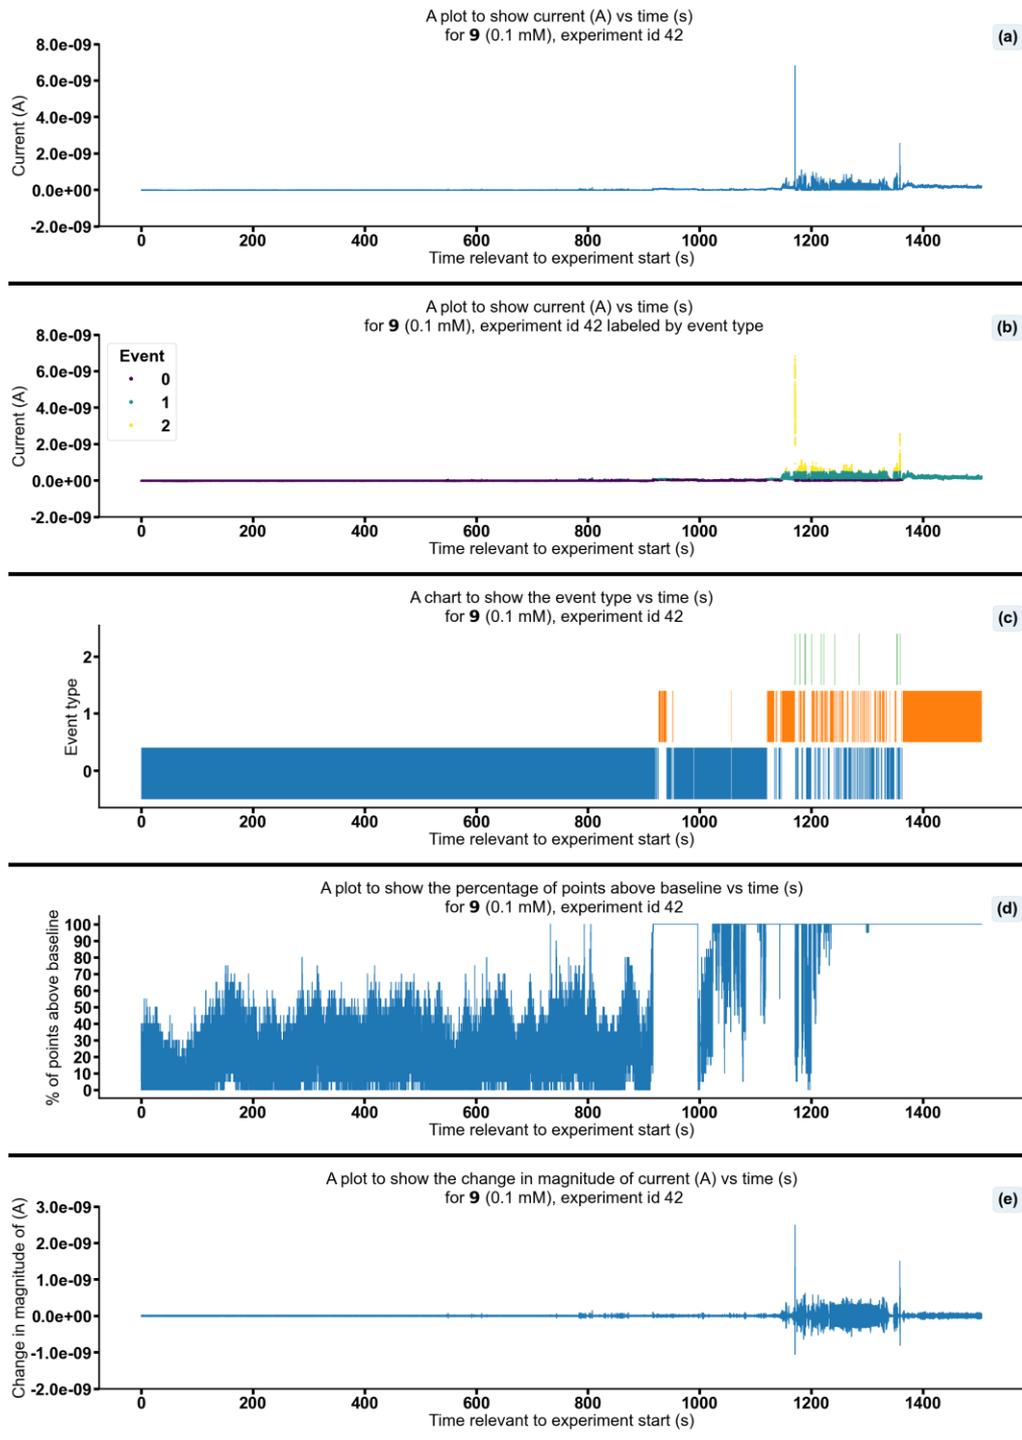

Figure S280 - Summarising the data from the patch clamp experiment for **9** (0.1 mM), experiment id 42 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.7×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

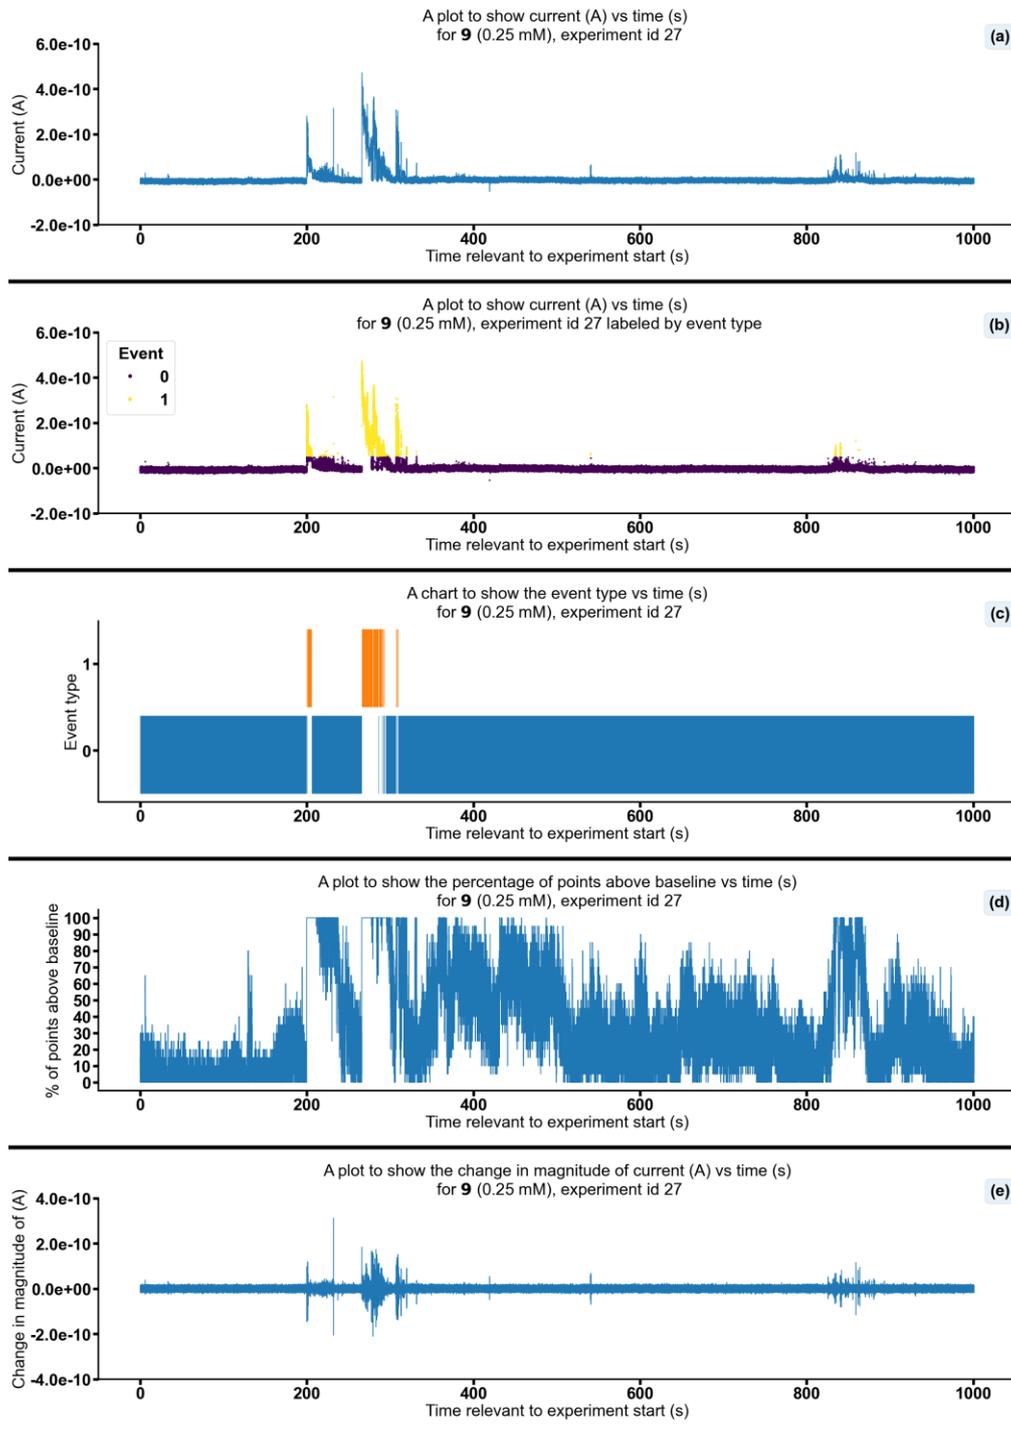

Figure S281 - Summarising the data from the patch clamp experiment for **9** (0.25 mM), experiment id 27 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -3.0×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

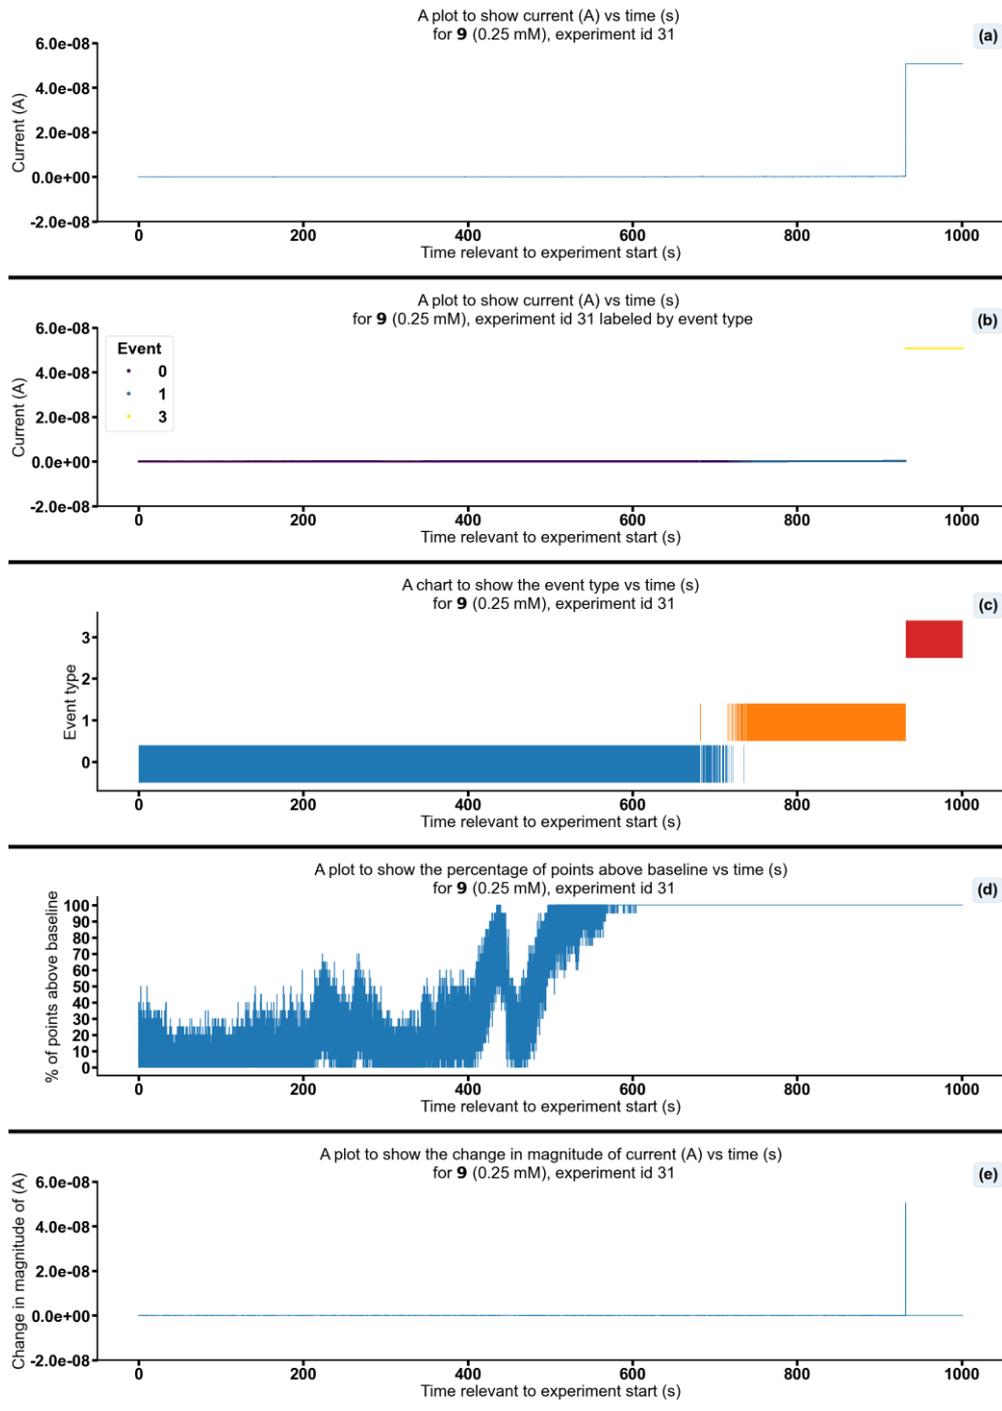

Figure S282 - Summarising the data from the patch clamp experiment for **9** (0.25 mM), experiment id 31 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -7.3×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

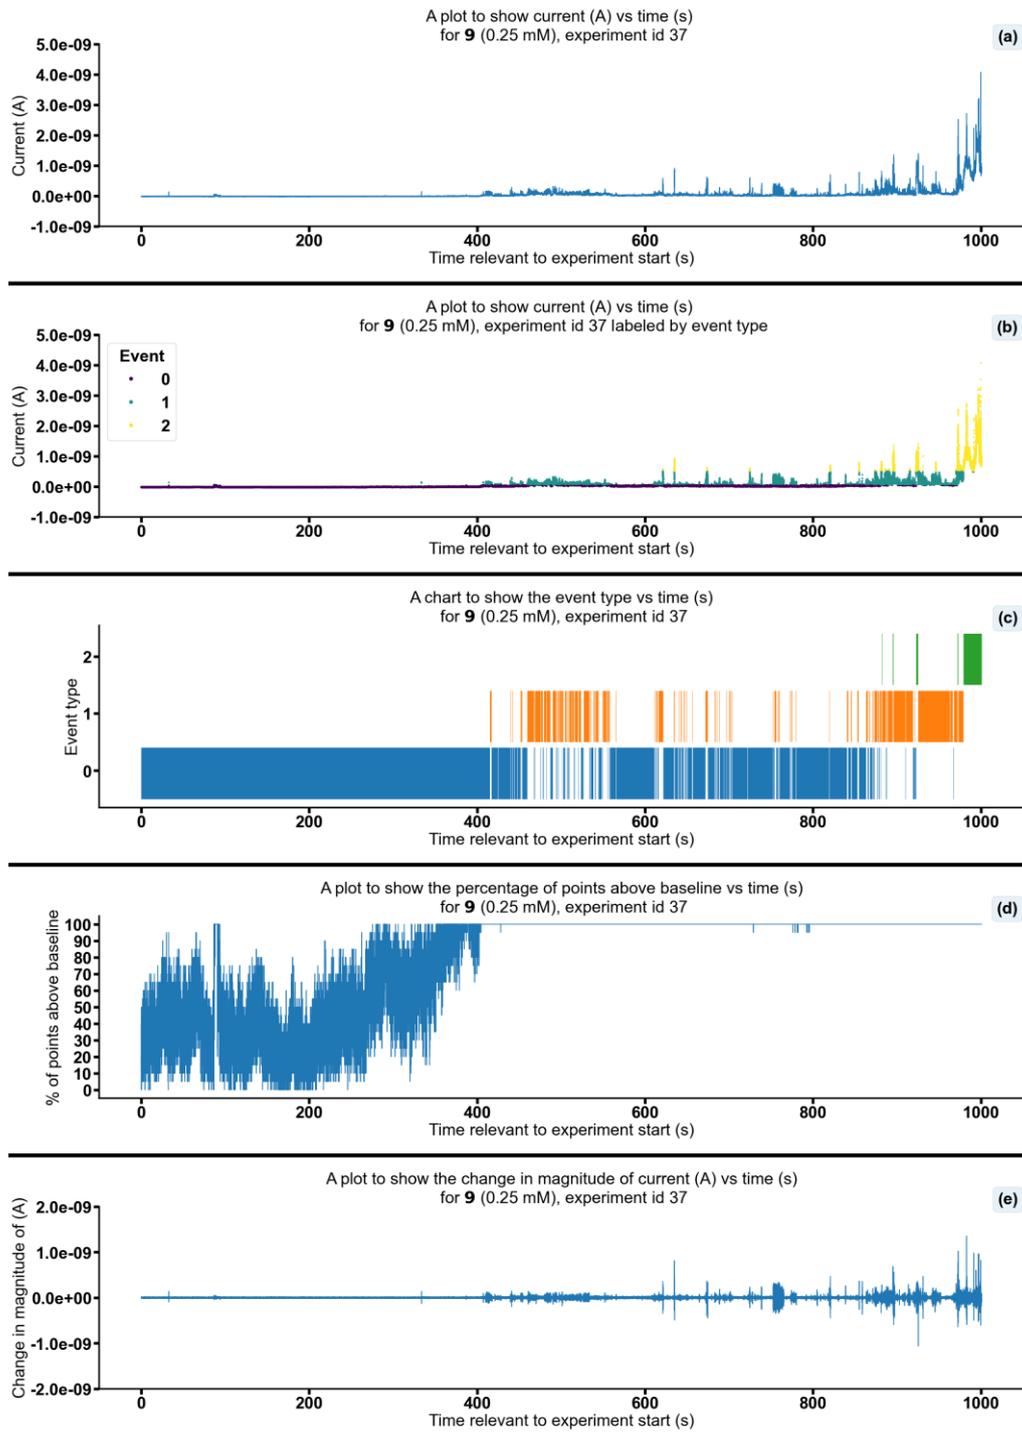

Figure S283 - Summarising the data from the patch clamp experiment for **9** (0.25 mM), experiment id 37 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.7×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

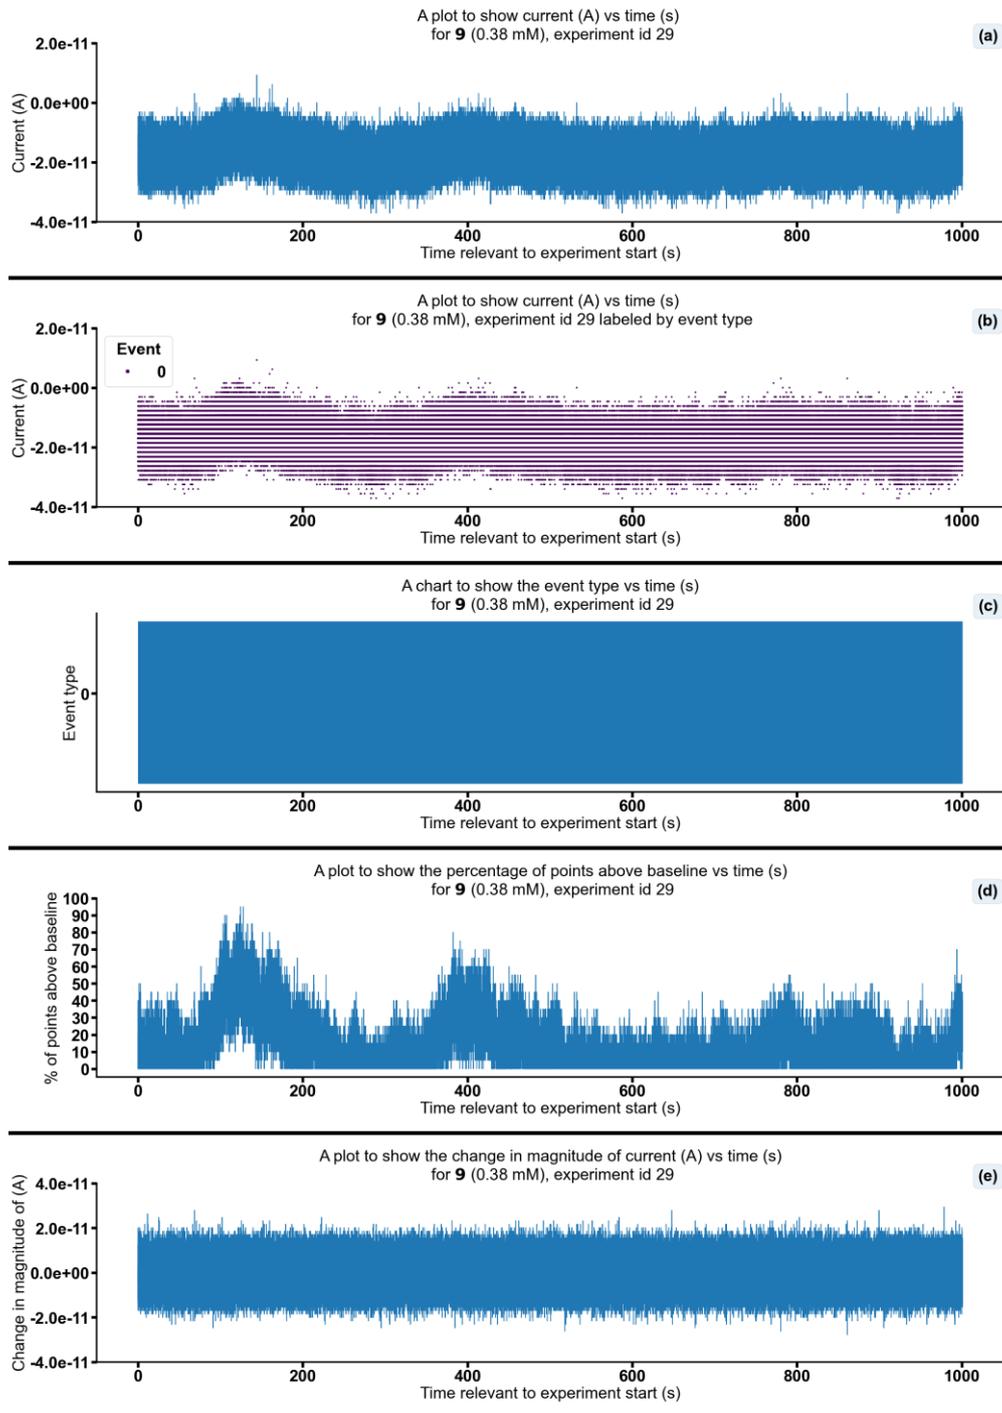

Figure S284 - Summarising the data from the patch clamp experiment for **9** (0.38 mM), experiment id 29 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.3×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

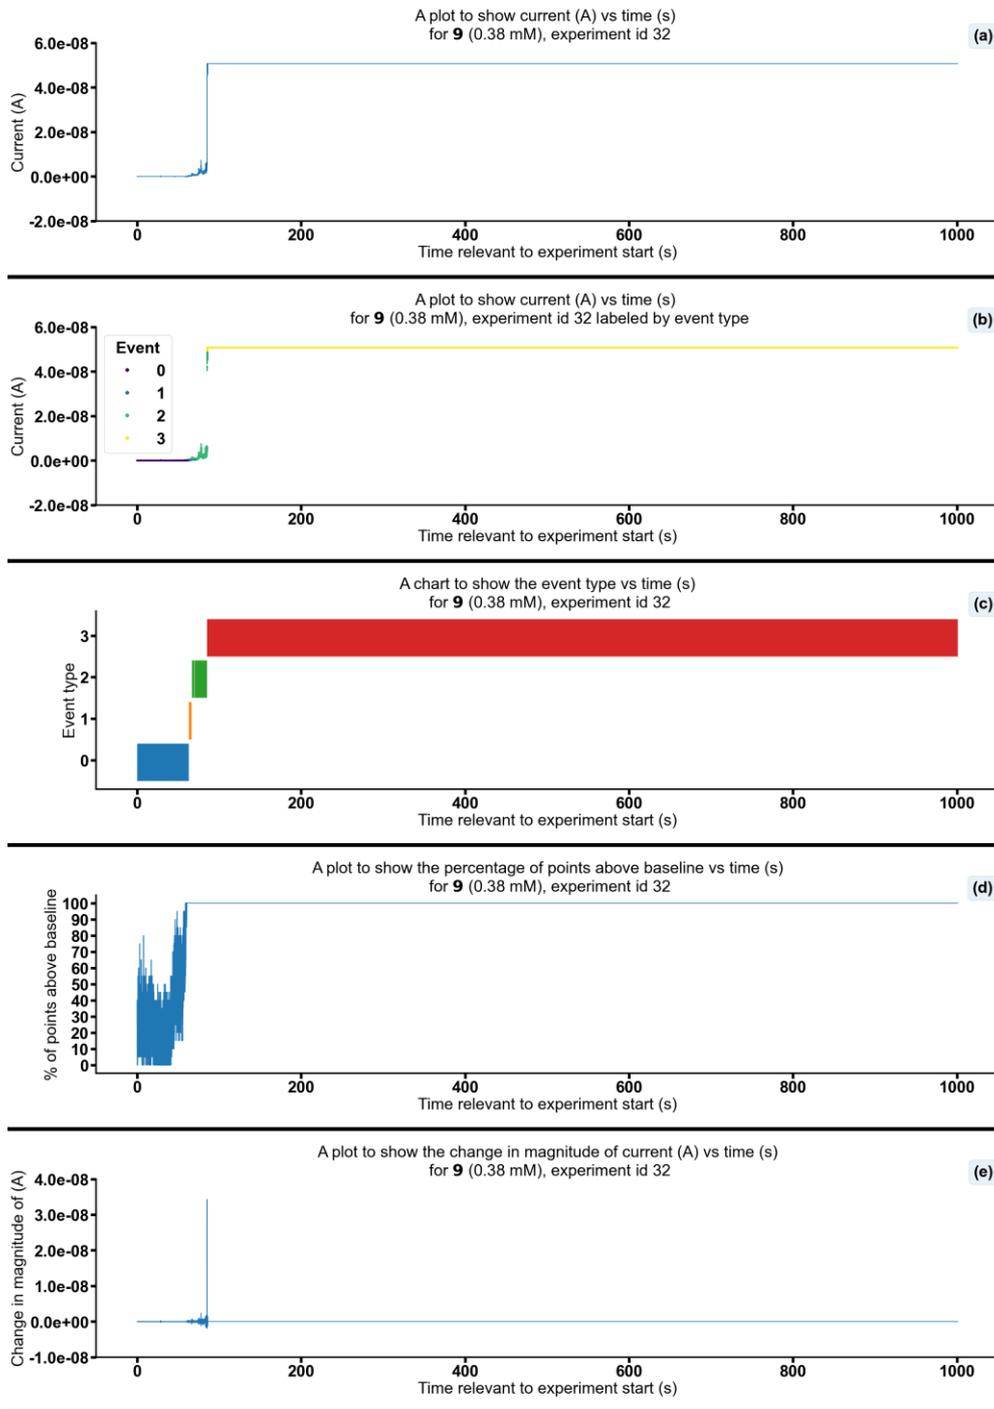

Figure S285 - Summarising the data from the patch clamp experiment for 9 (0.38 mM), experiment id 32 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.4×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

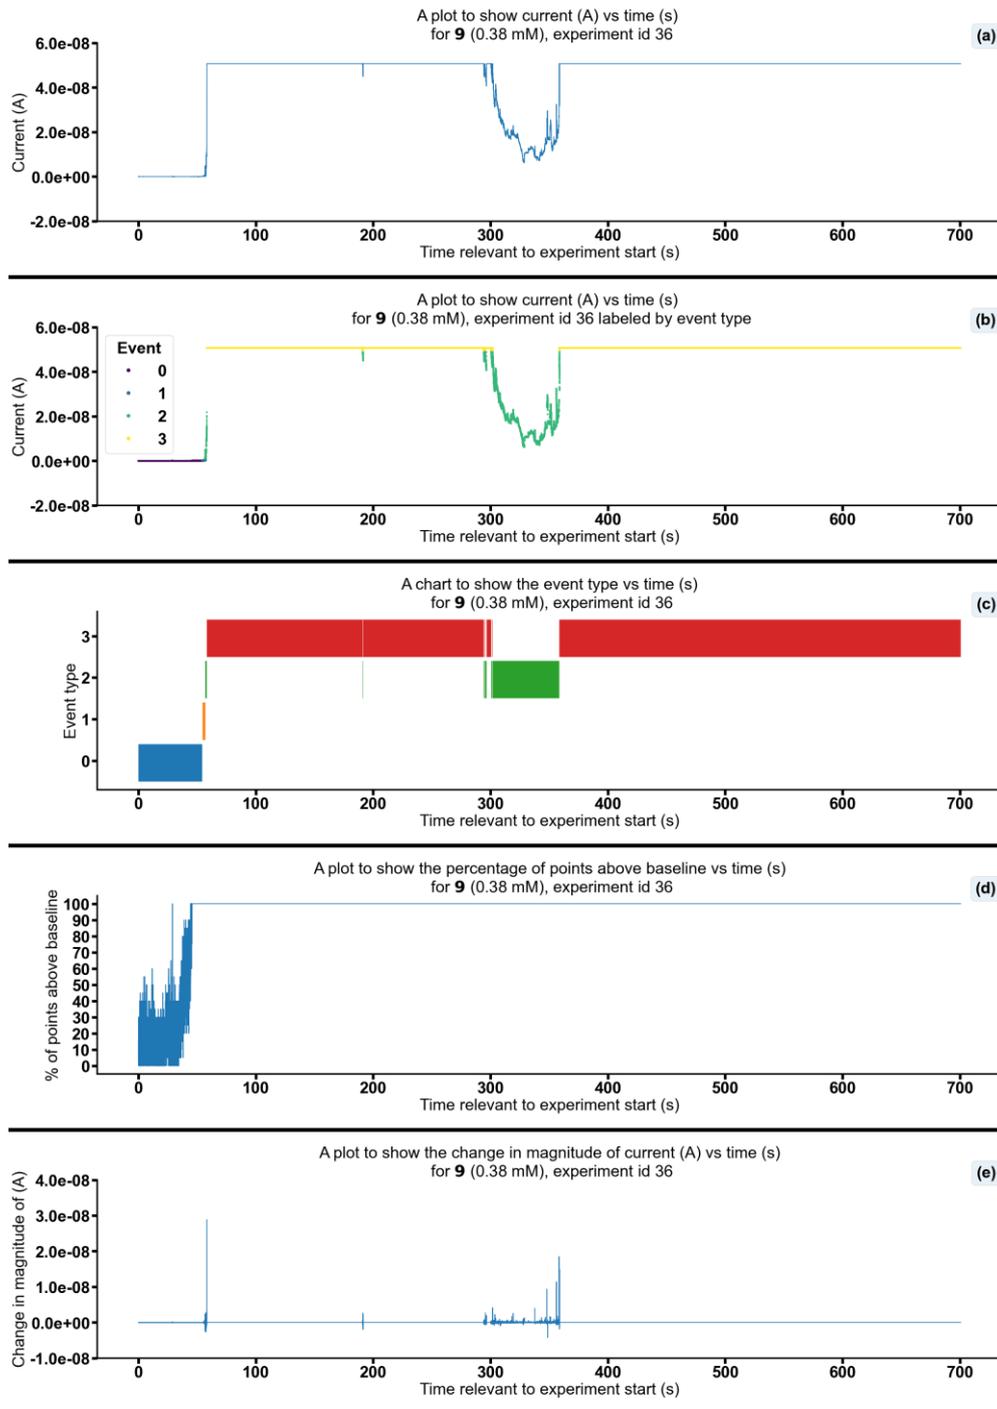

Figure S286 - Summarising the data from the patch clamp experiment for **9** (0.38 mM), experiment id 36 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

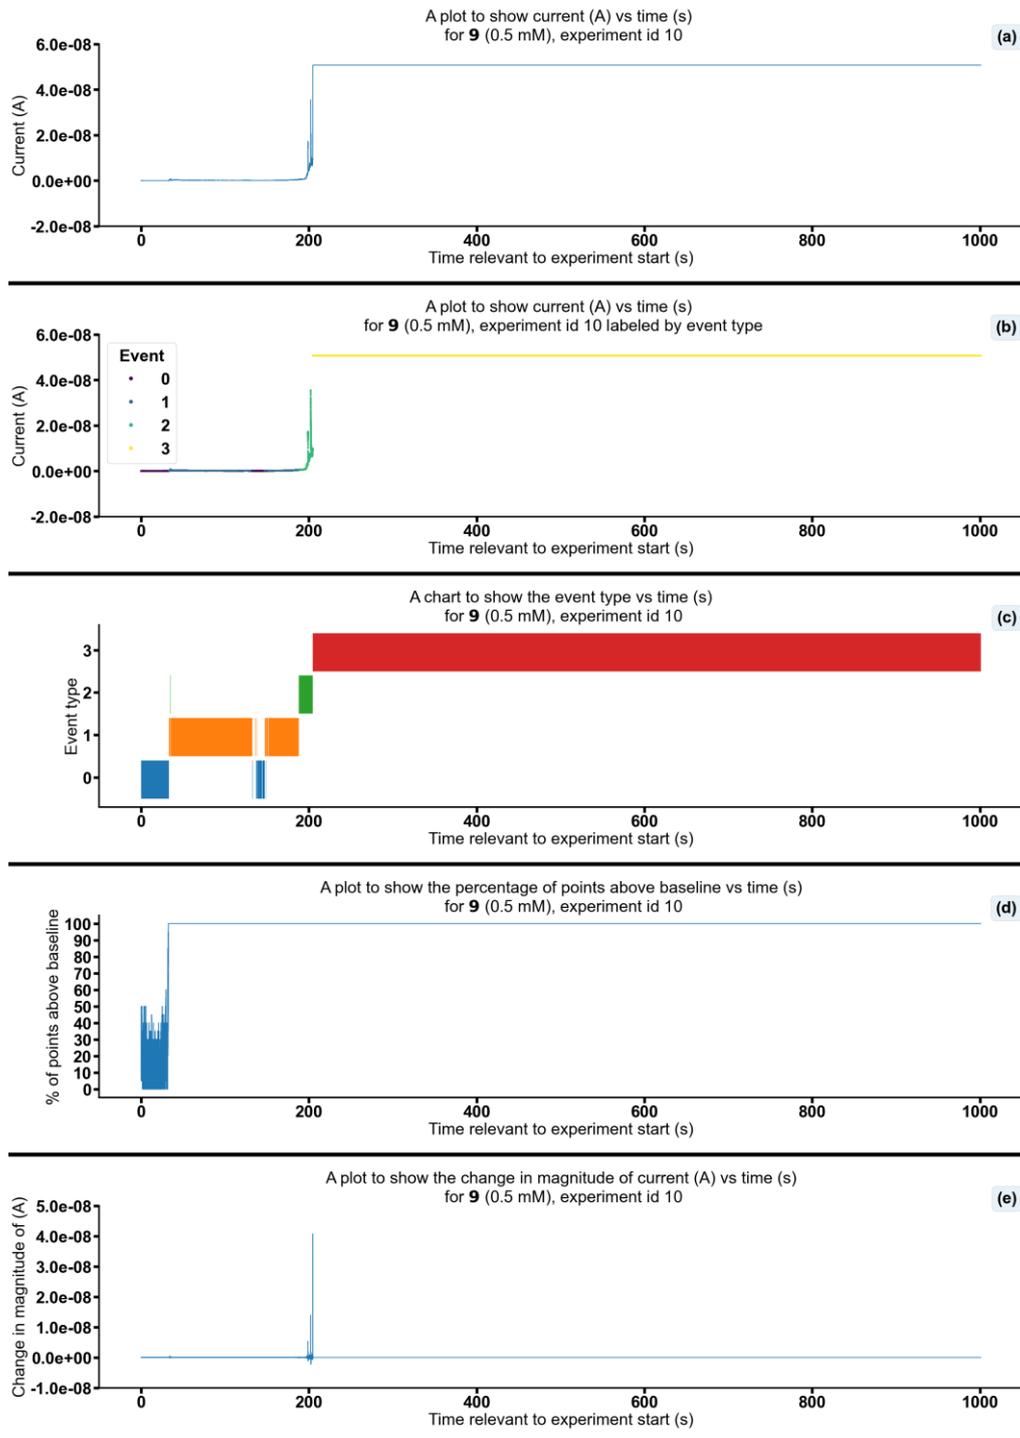

Figure S287 - Summarising the data from the patch clamp experiment for 9 (0.5 mM), experiment id 10 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -8.0×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

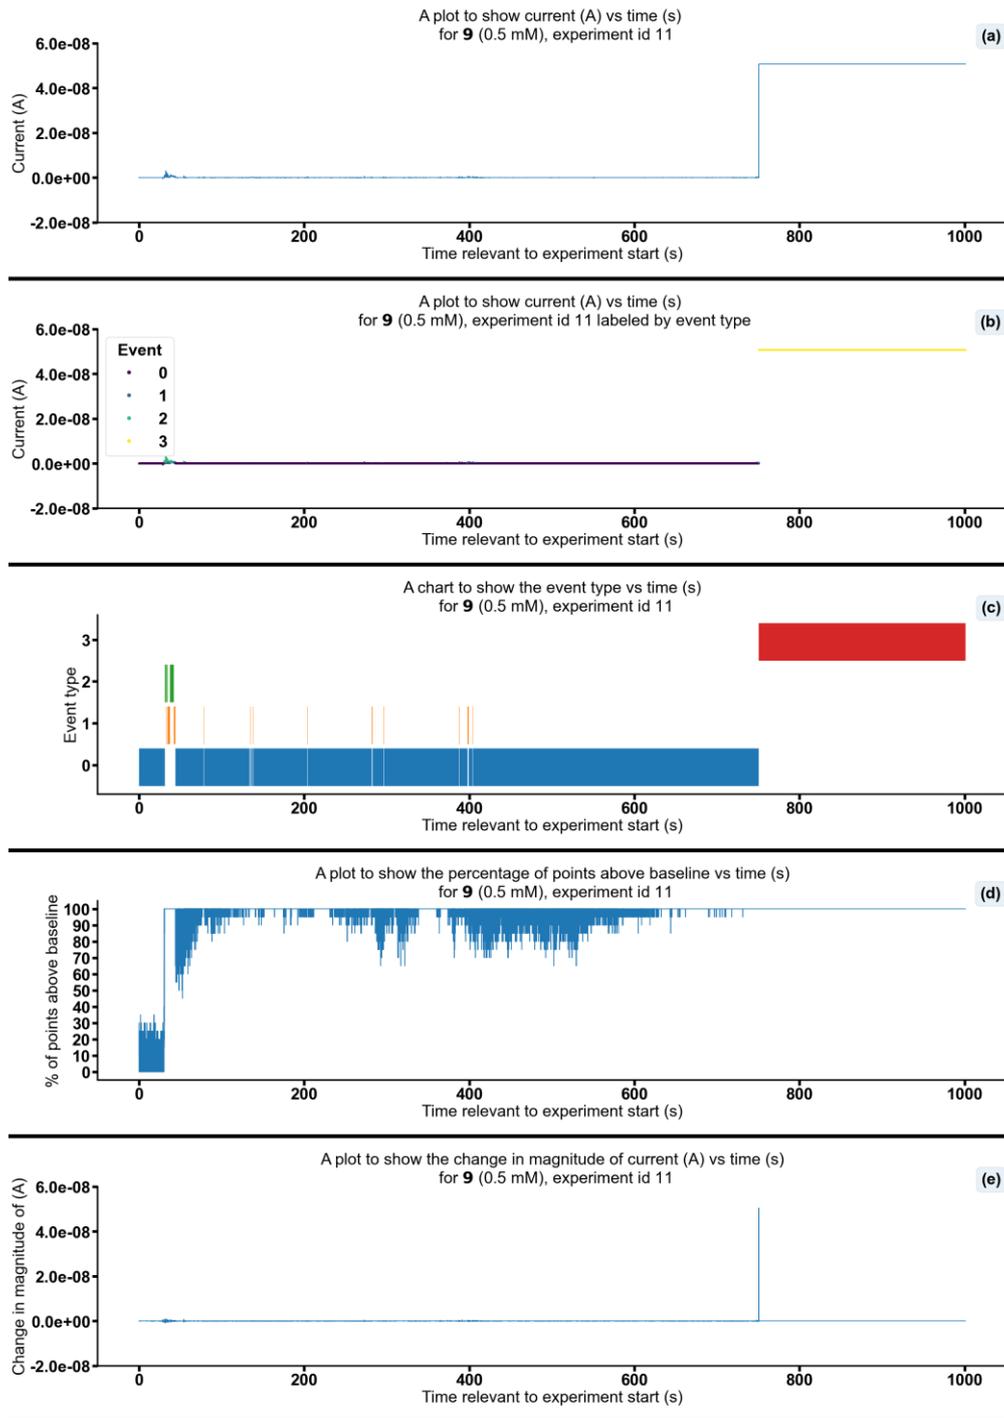

Figure S288 - Summarising the data from the patch clamp experiment for **9** (0.5 mM), experiment id 11 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -4.5×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

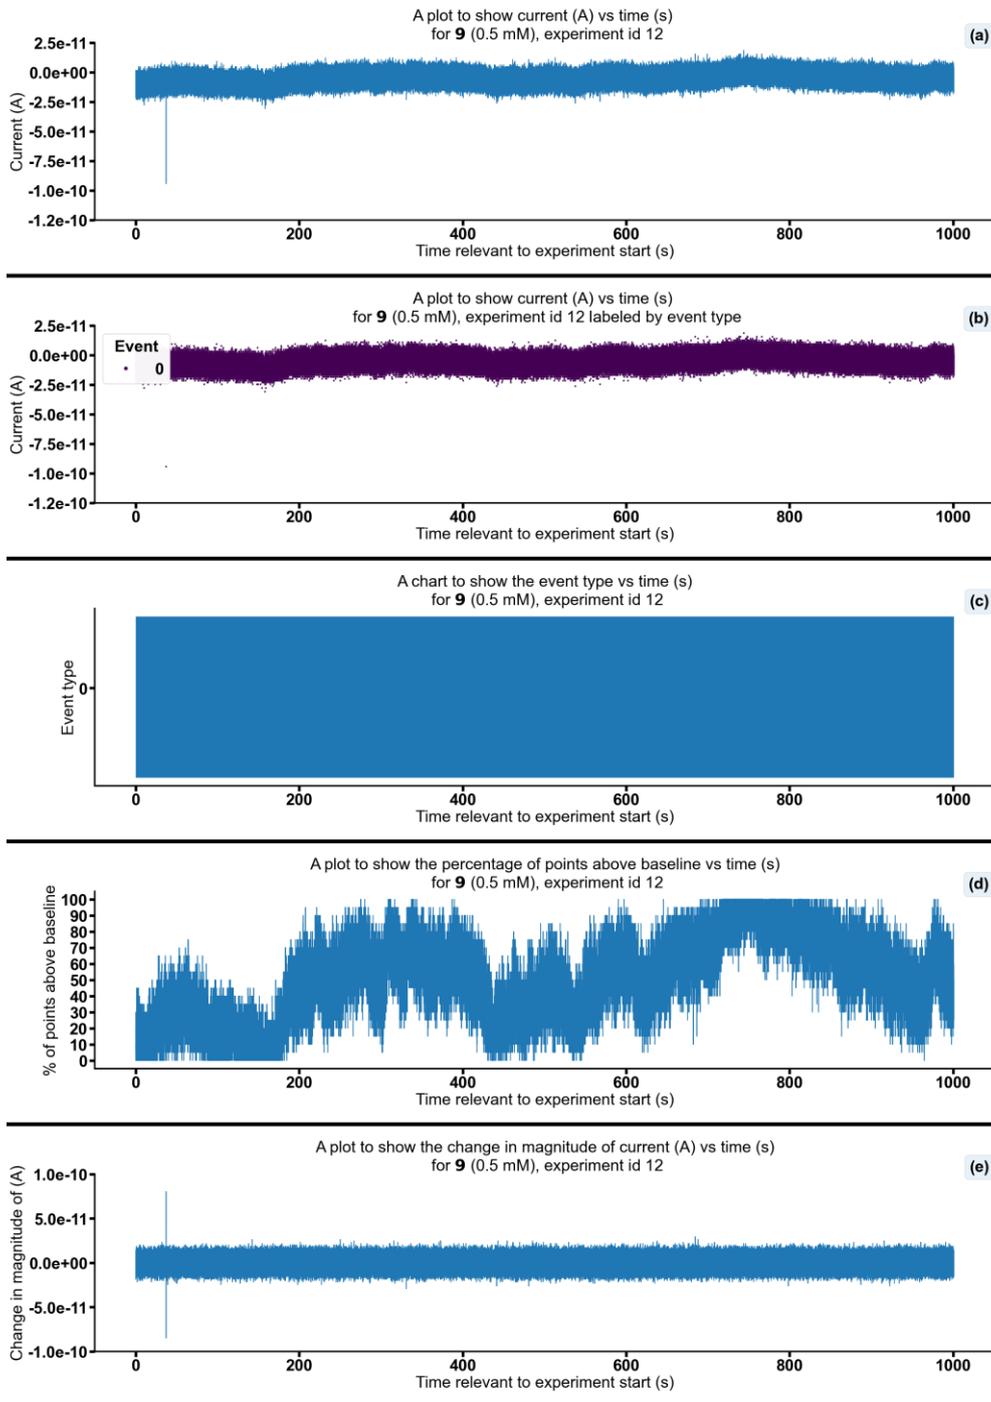

Figure S289 - Summarising the data from the patch clamp experiment for **9** (0.5 mM), experiment id 12 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -5.2×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

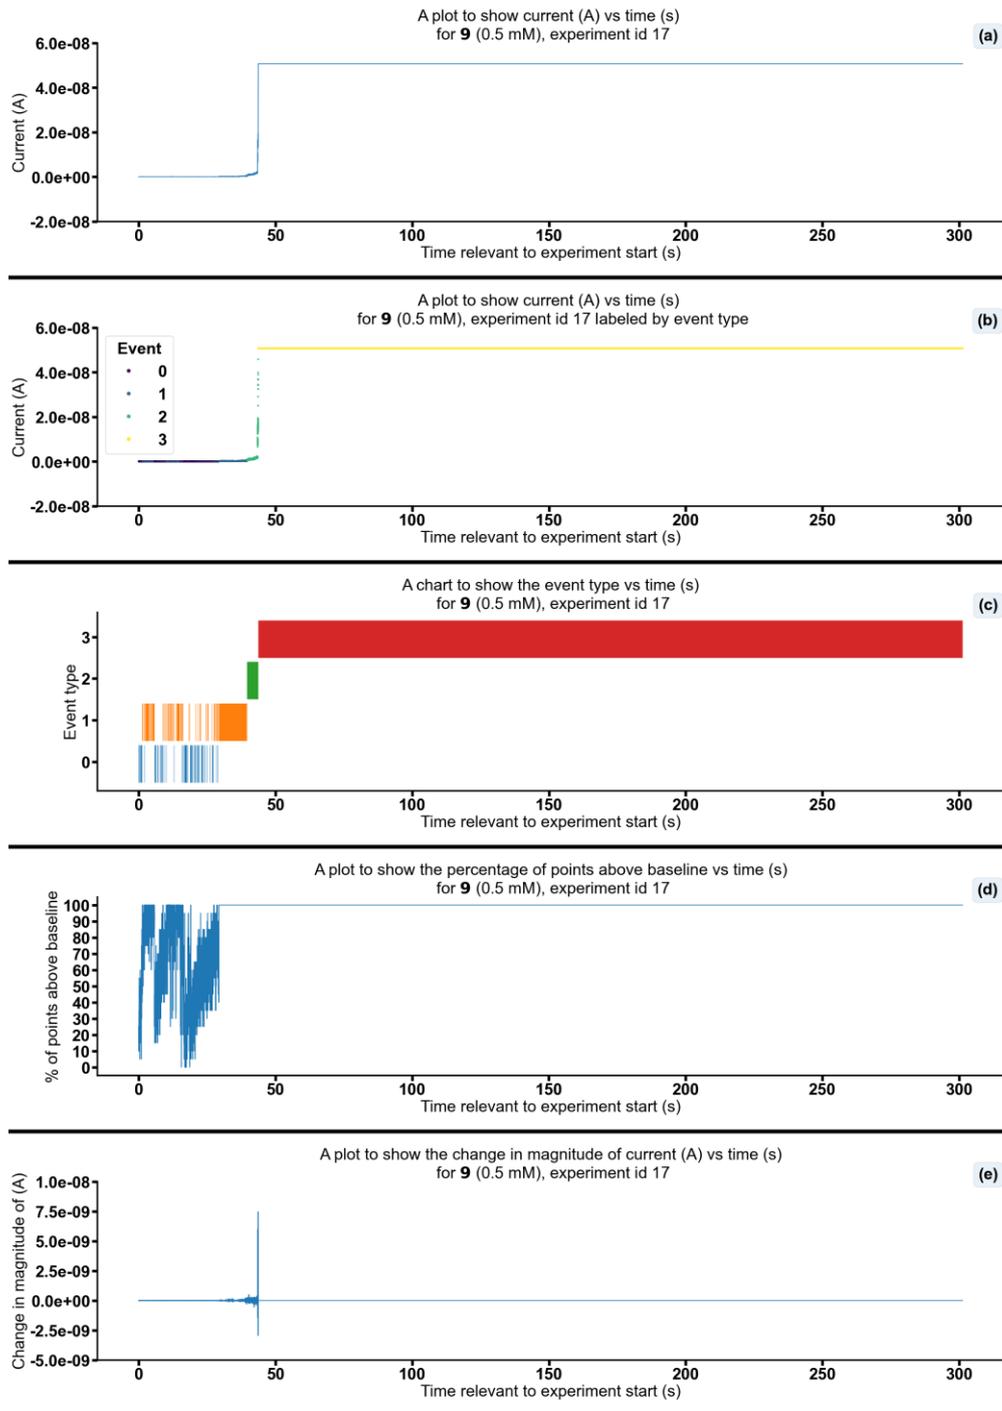

Figure S290- Summarising the data from the patch clamp experiment for 9 (0.5 mM), experiment id 17 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 4.9×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

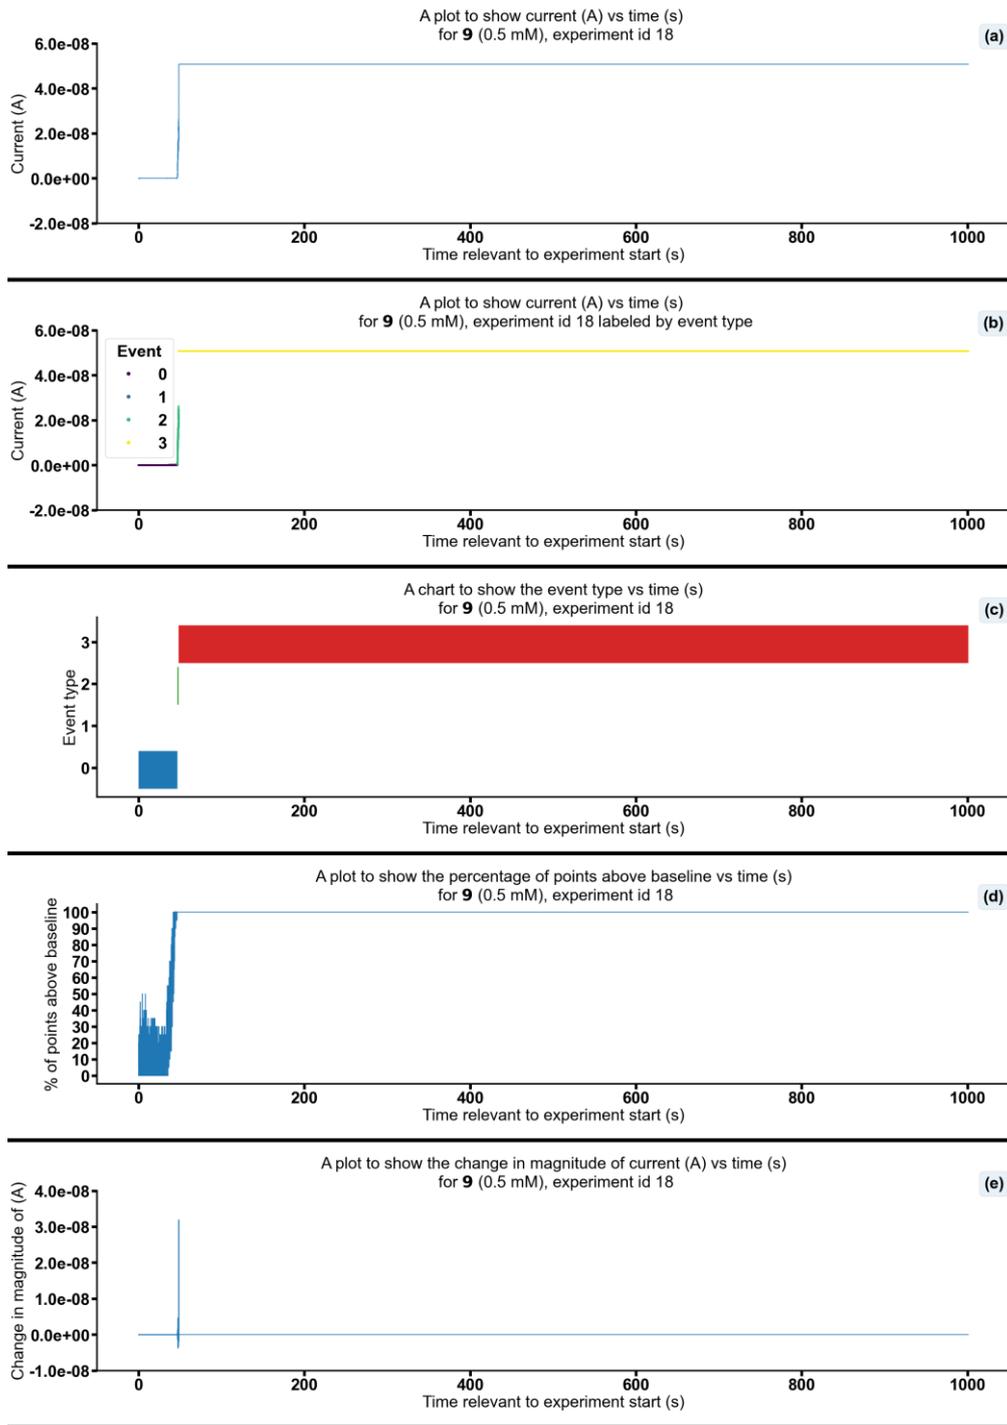

Figure S291 - Summarising the data from the patch clamp experiment for 9 (0.5 mM), experiment id 18 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.0×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

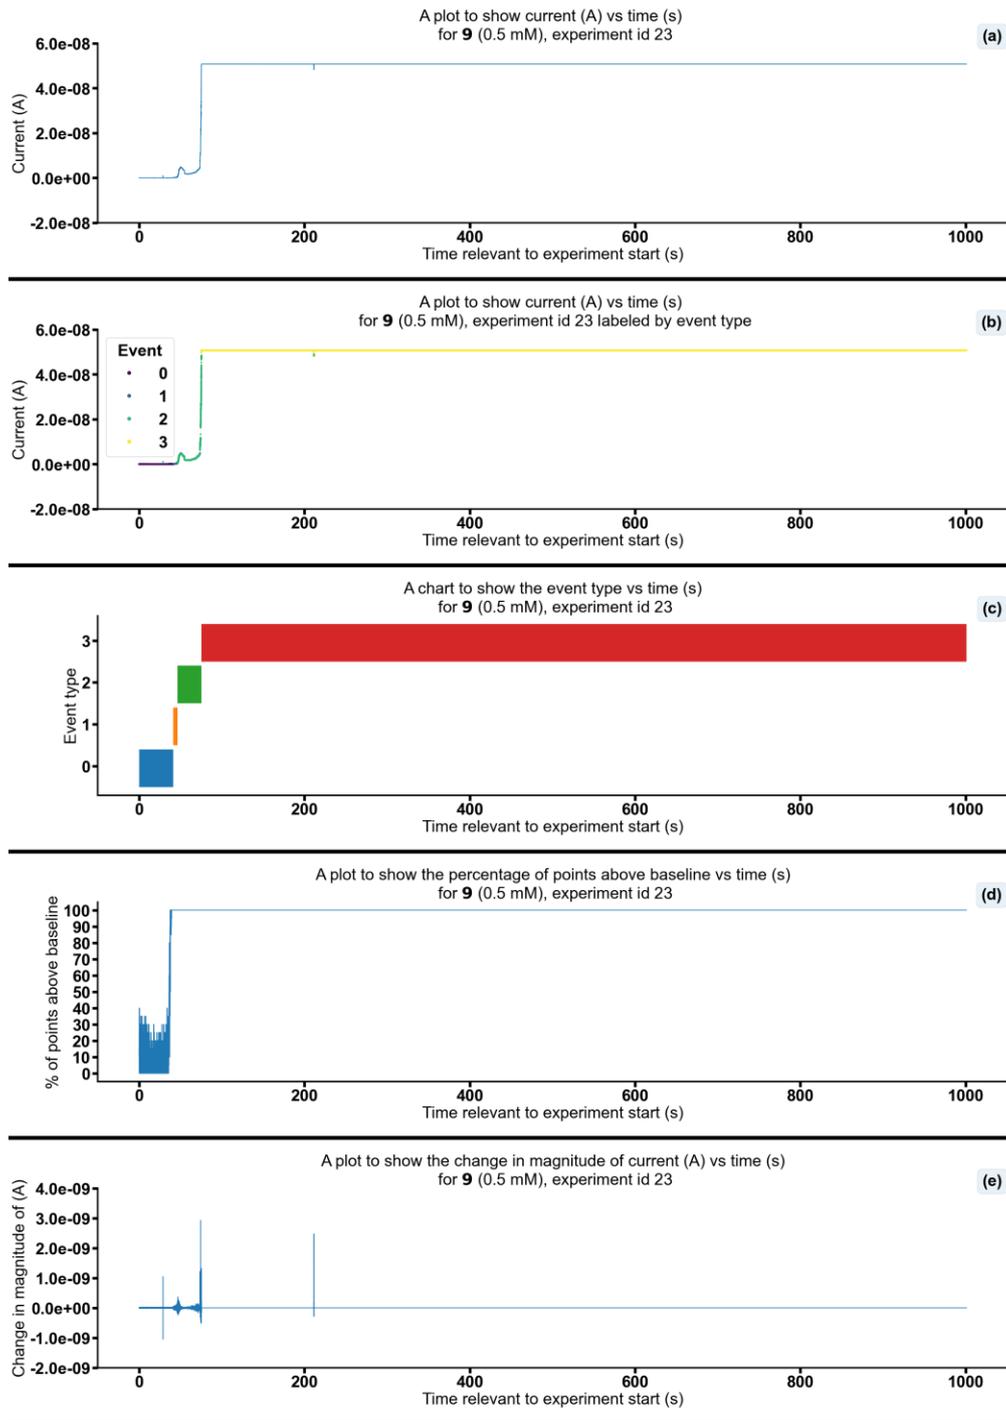

Figure S292 - Summarising the data from the patch clamp experiment for 9 (0.5 mM), experiment id 23 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -8.6×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

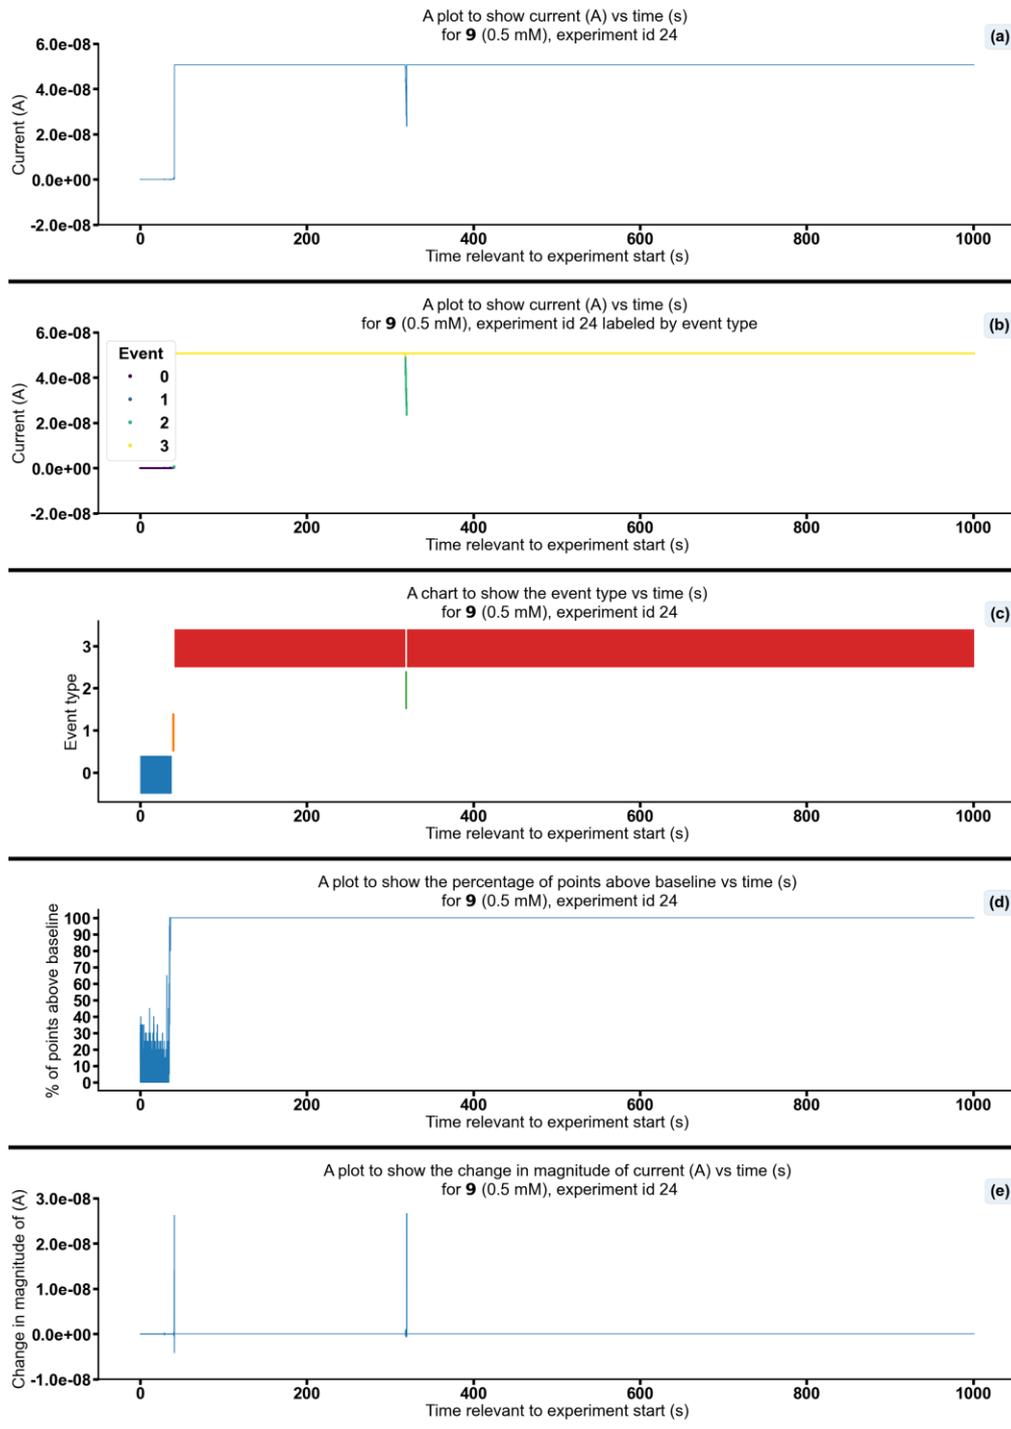

Figure S293 - Summarising the data from the patch clamp experiment for 9 (0.5 mM), experiment id 24 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -9.0×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

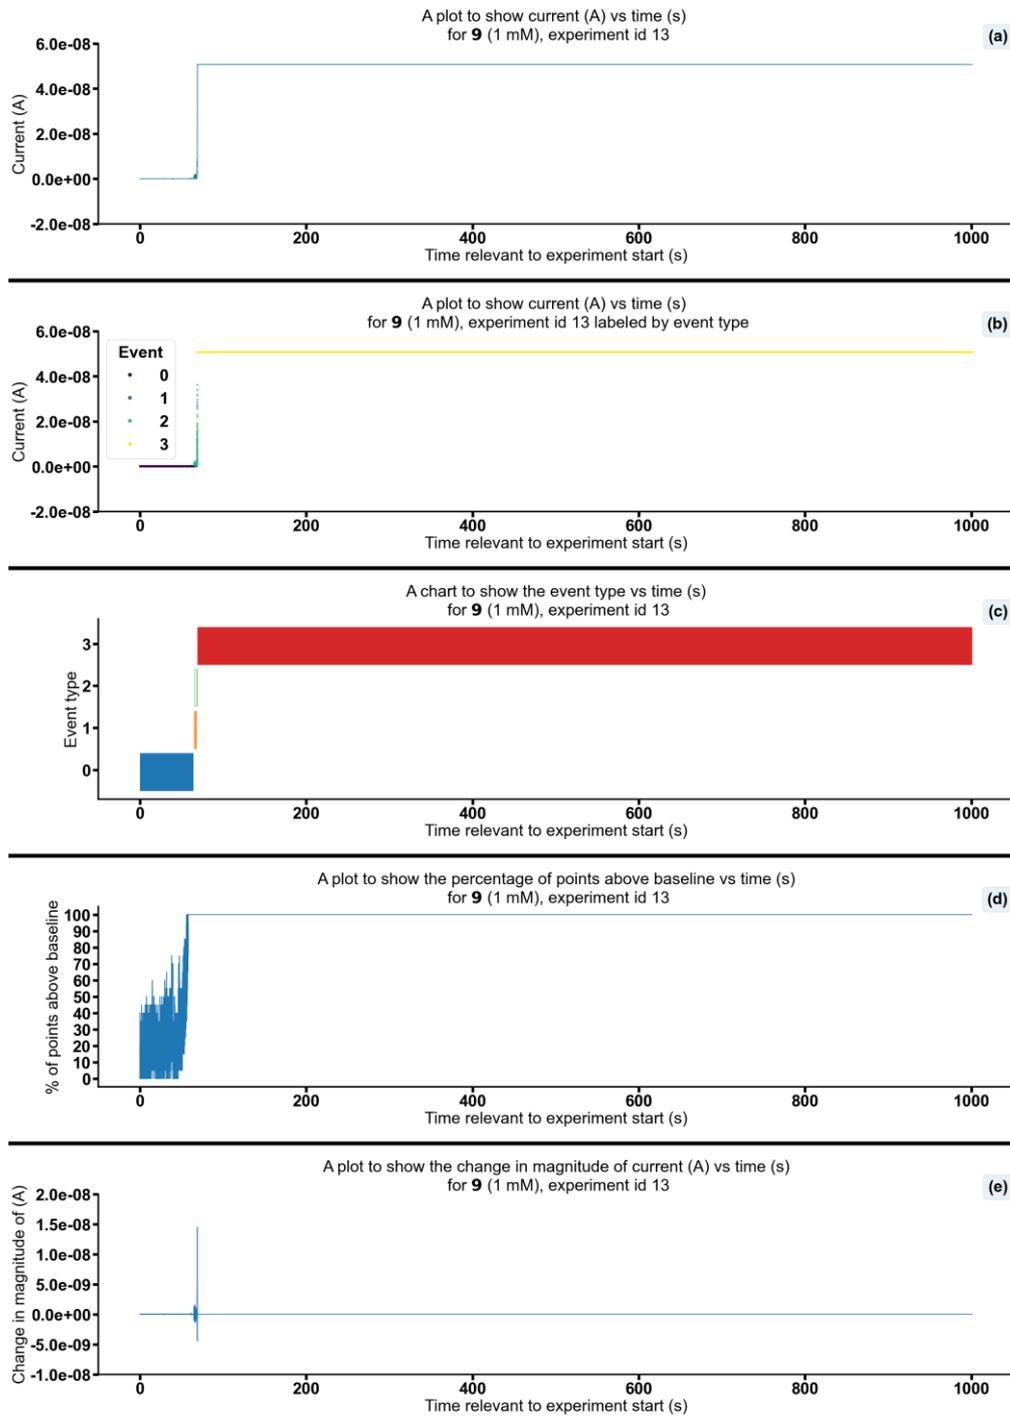

Figure S294 - Summarising the data from the patch clamp experiment for 9 (1 mM), experiment id 13 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold 6.9×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

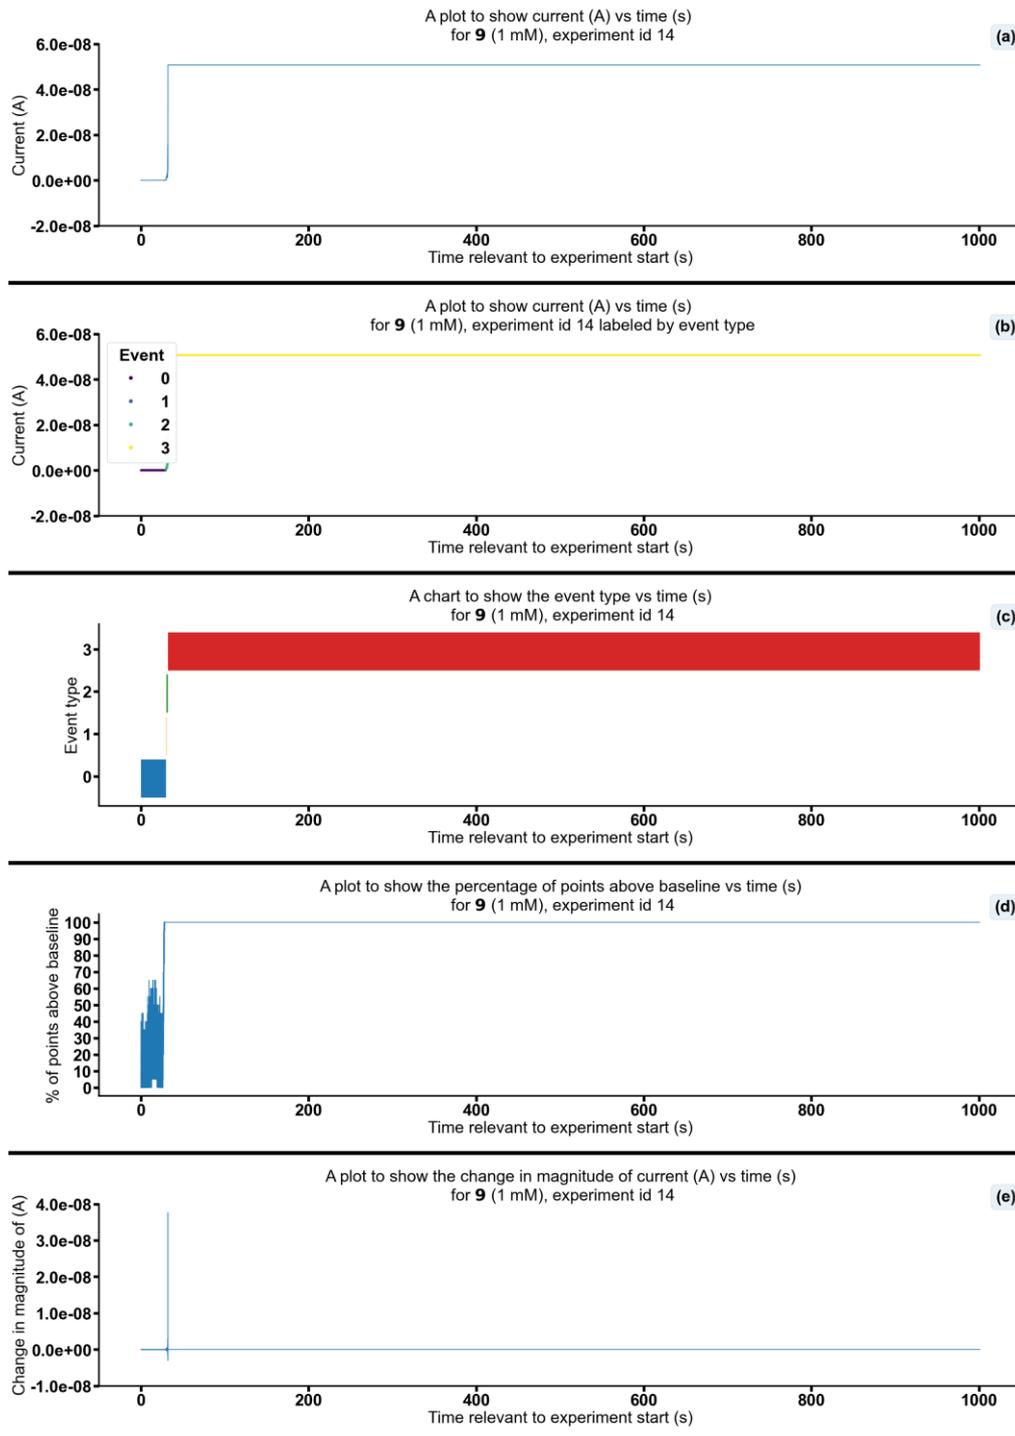

Figure S295 - Summarising the data from the patch clamp experiment for 9 (1 mM), experiment id 14 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold -6.6×10^{-13} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

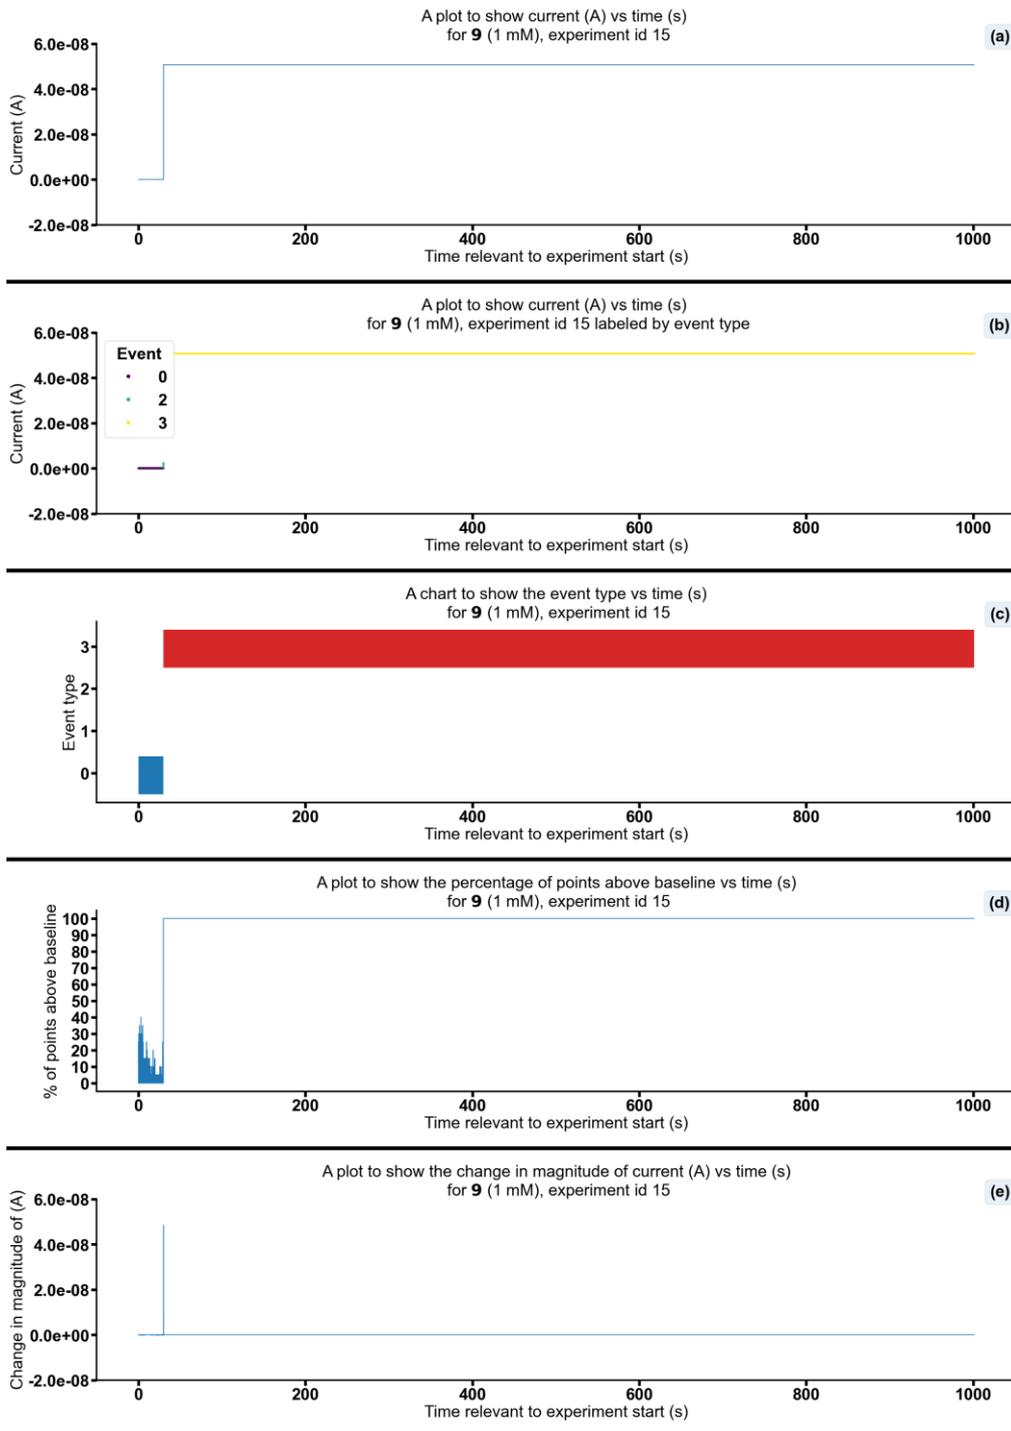

Figure S296 - Summarising the data from the patch clamp experiment for 9 (1 mM), experiment id 15 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 < 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 < 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 < 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 < ∞ A. Subfigure (d) shows the percentage of points found above the threshold 2.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

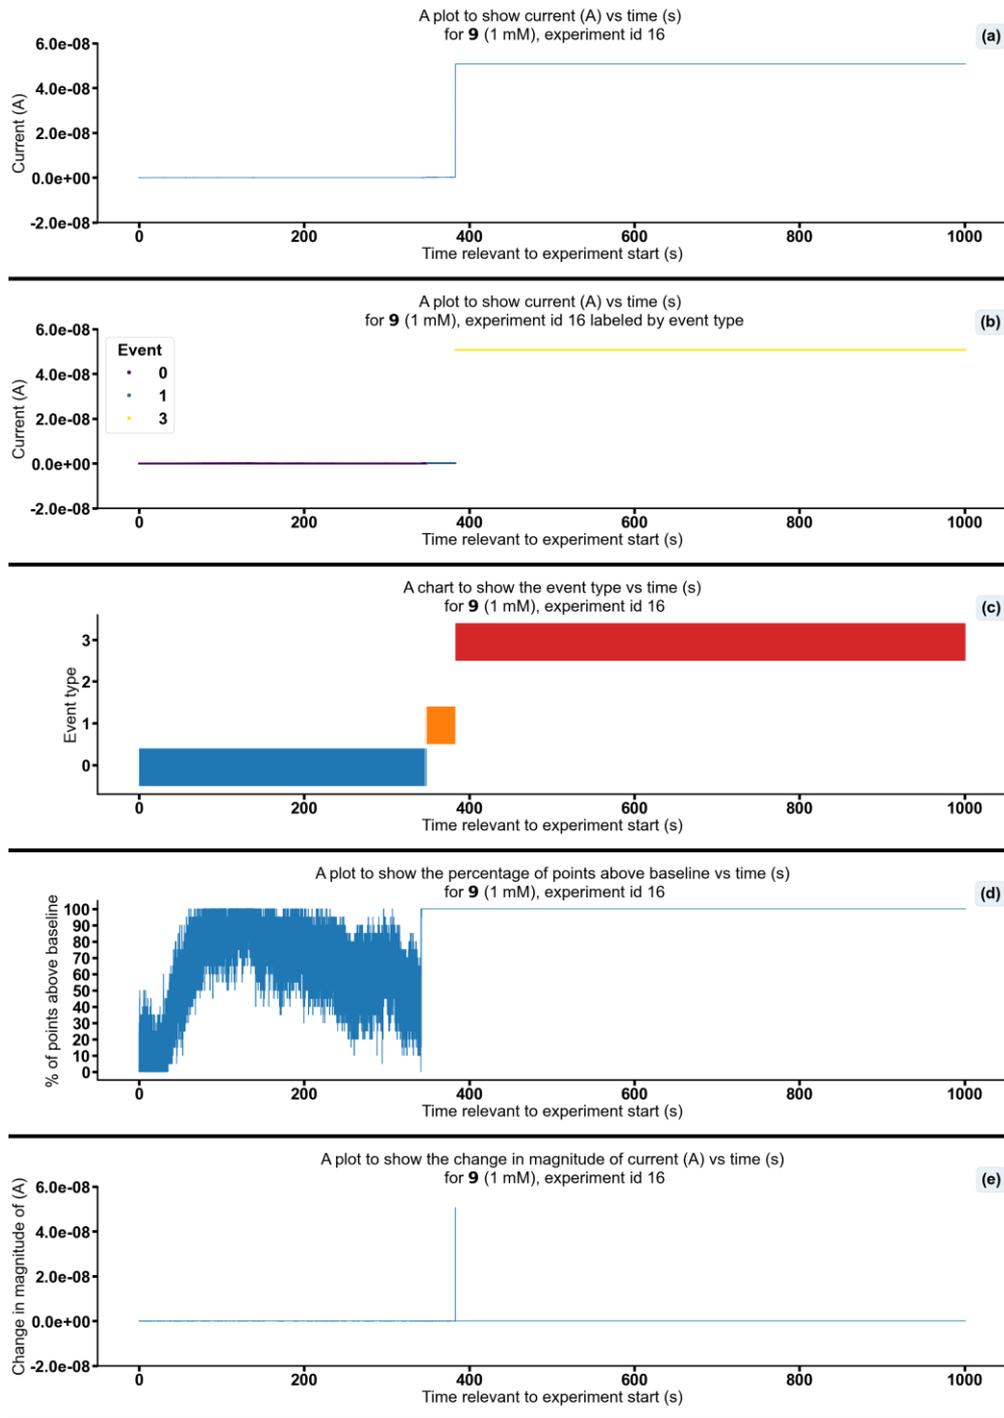

Figure S297 - Summarising the data from the patch clamp experiment for 9 (1 mM), experiment id 16 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.7×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

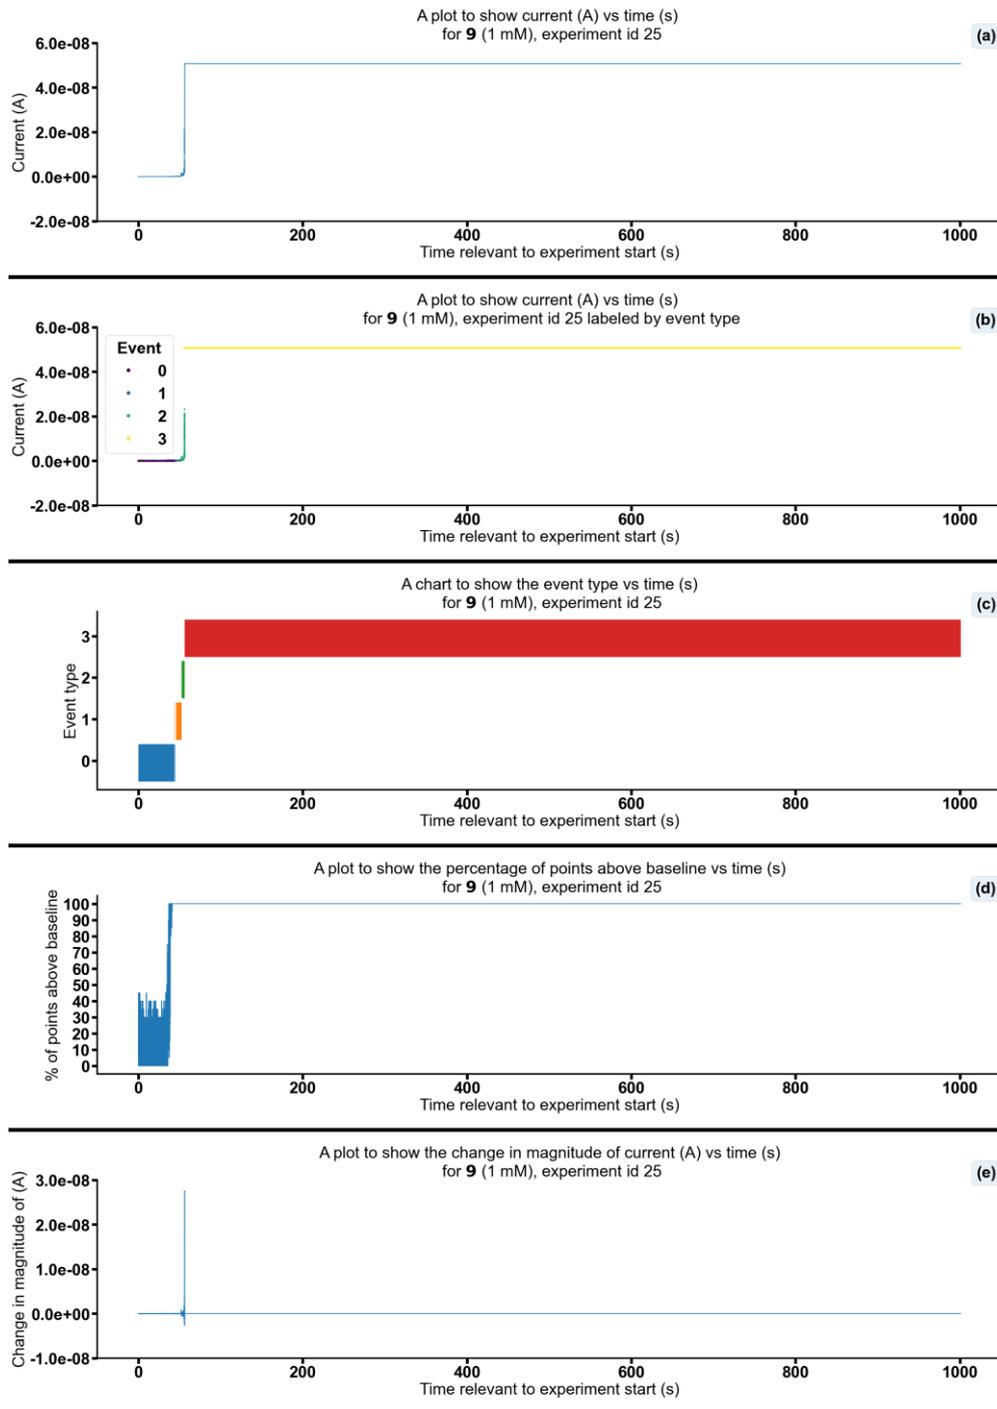

Figure S298 - Summarising the data from the patch clamp experiment for **9** (1 mM), experiment id 25 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -7.9×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

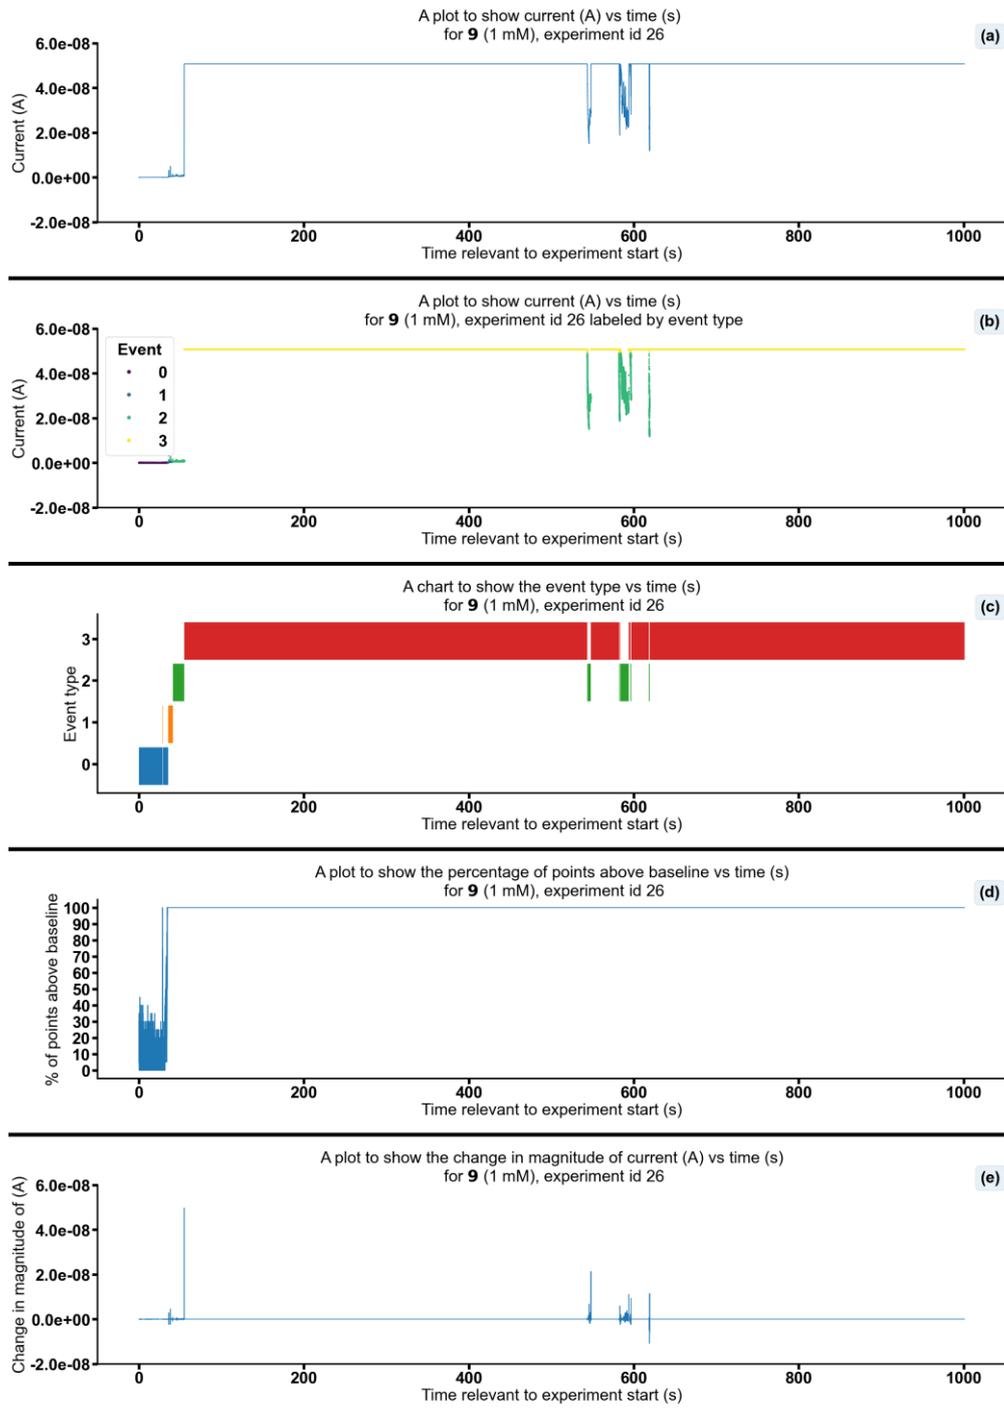

Figure S299 - Summarising the data from the patch clamp experiment for **9** (1 mM), experiment id 26 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -7.1×10^{-12} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Changing the concentration of **7** and **9** (1:1)

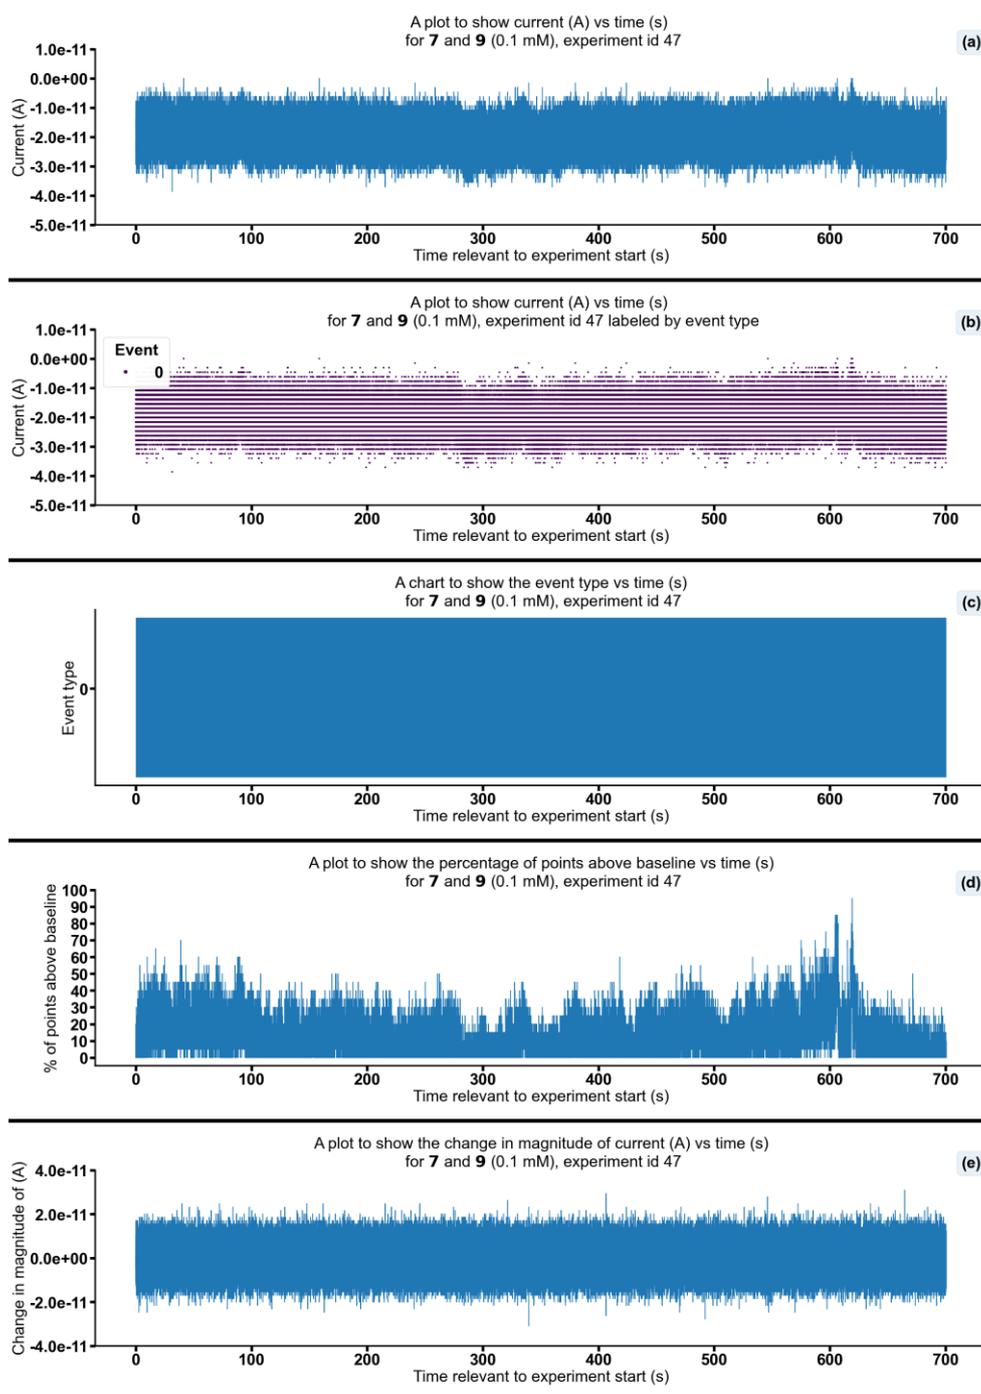

Figure S300 - Summarising the data from the patch clamp experiment for **7** and **9** (0.1 mM), experiment id 47 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $<$ 5.00×10^{-11} A, 1: 5.00×10^{-11} A \leq Event 1 $<$ 5.00×10^{-10} A, 2: 5.00×10^{-10} A \leq Event 2 $<$ 4.90×10^{-8} A, 3: 4.90×10^{-8} A \leq Event 3 $<$ ∞ A. Subfigure (d) shows the percentage of points found above the threshold -1.5×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

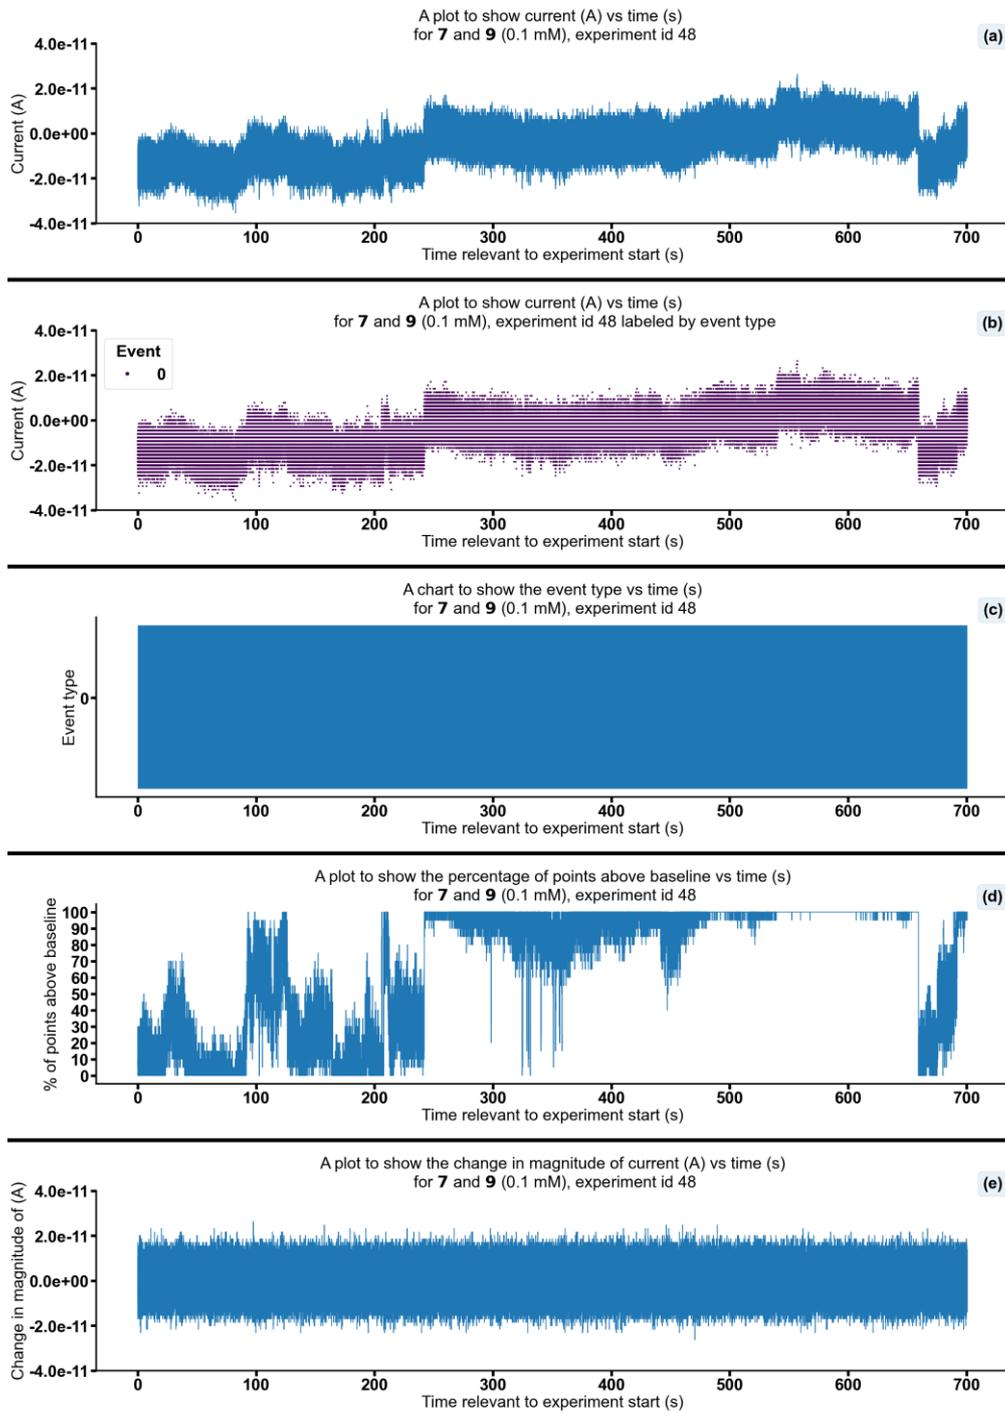

Figure S301 - Summarising the data from the patch clamp experiment for 7 and 9 (0.1 mM), experiment id 48 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.1 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

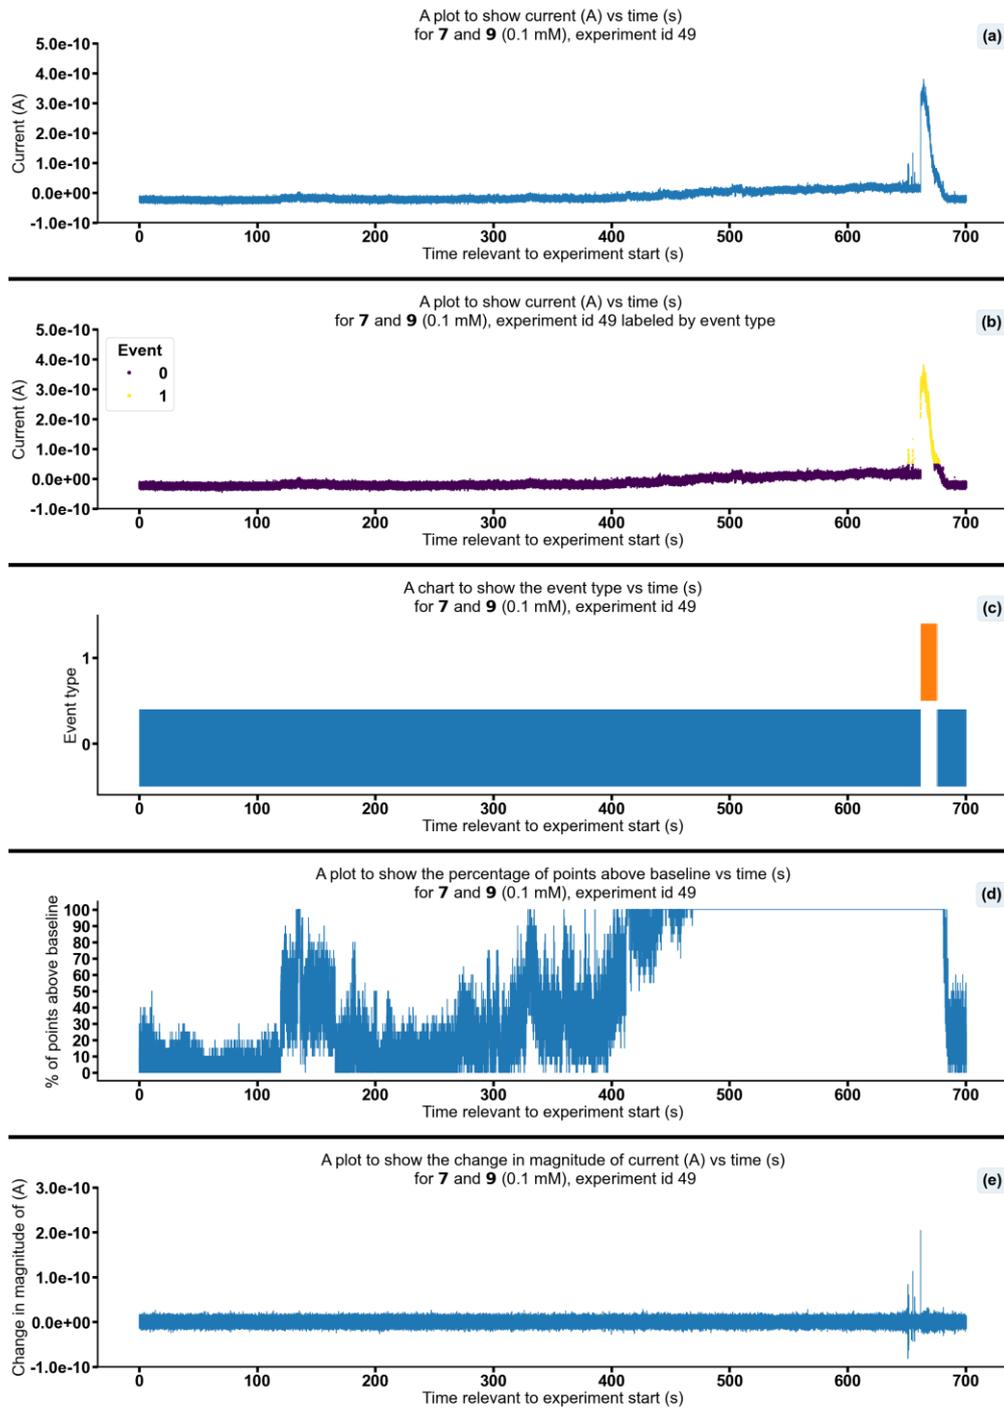

Figure S302 - Summarising the data from the patch clamp experiment for **7** and **9** (0.1 mM), experiment id 49 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-08}$ A, 3: 4.90×10^{-08} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.9×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

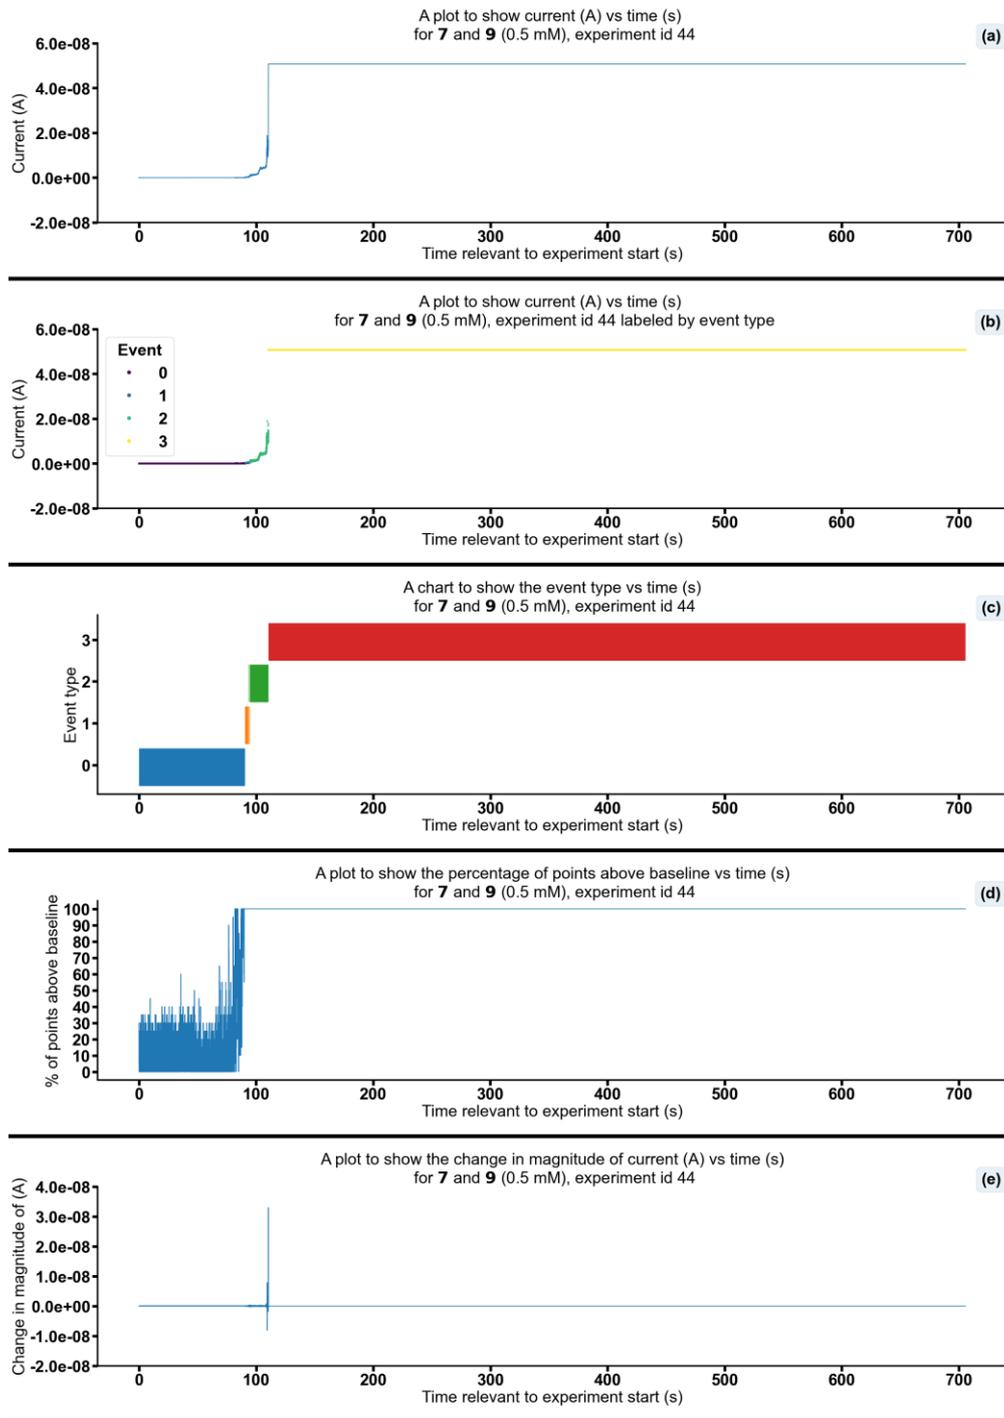

Figure S303 - Summarising the data from the patch clamp experiment for 7 and 9 (0.5 mM), experiment id 44 at +100 mV. Events were categorised into the following types: 0: $-\infty$ A \leq Event 0 $< 5.00 \times 10^{-11}$ A, 1: 5.00×10^{-11} A \leq Event 1 $< 5.00 \times 10^{-10}$ A, 2: 5.00×10^{-10} A \leq Event 2 $< 4.90 \times 10^{-8}$ A, 3: 4.90×10^{-8} A \leq Event 3 $< \infty$ A. Subfigure (d) shows the percentage of points found above the threshold -1.8×10^{-11} (A) in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

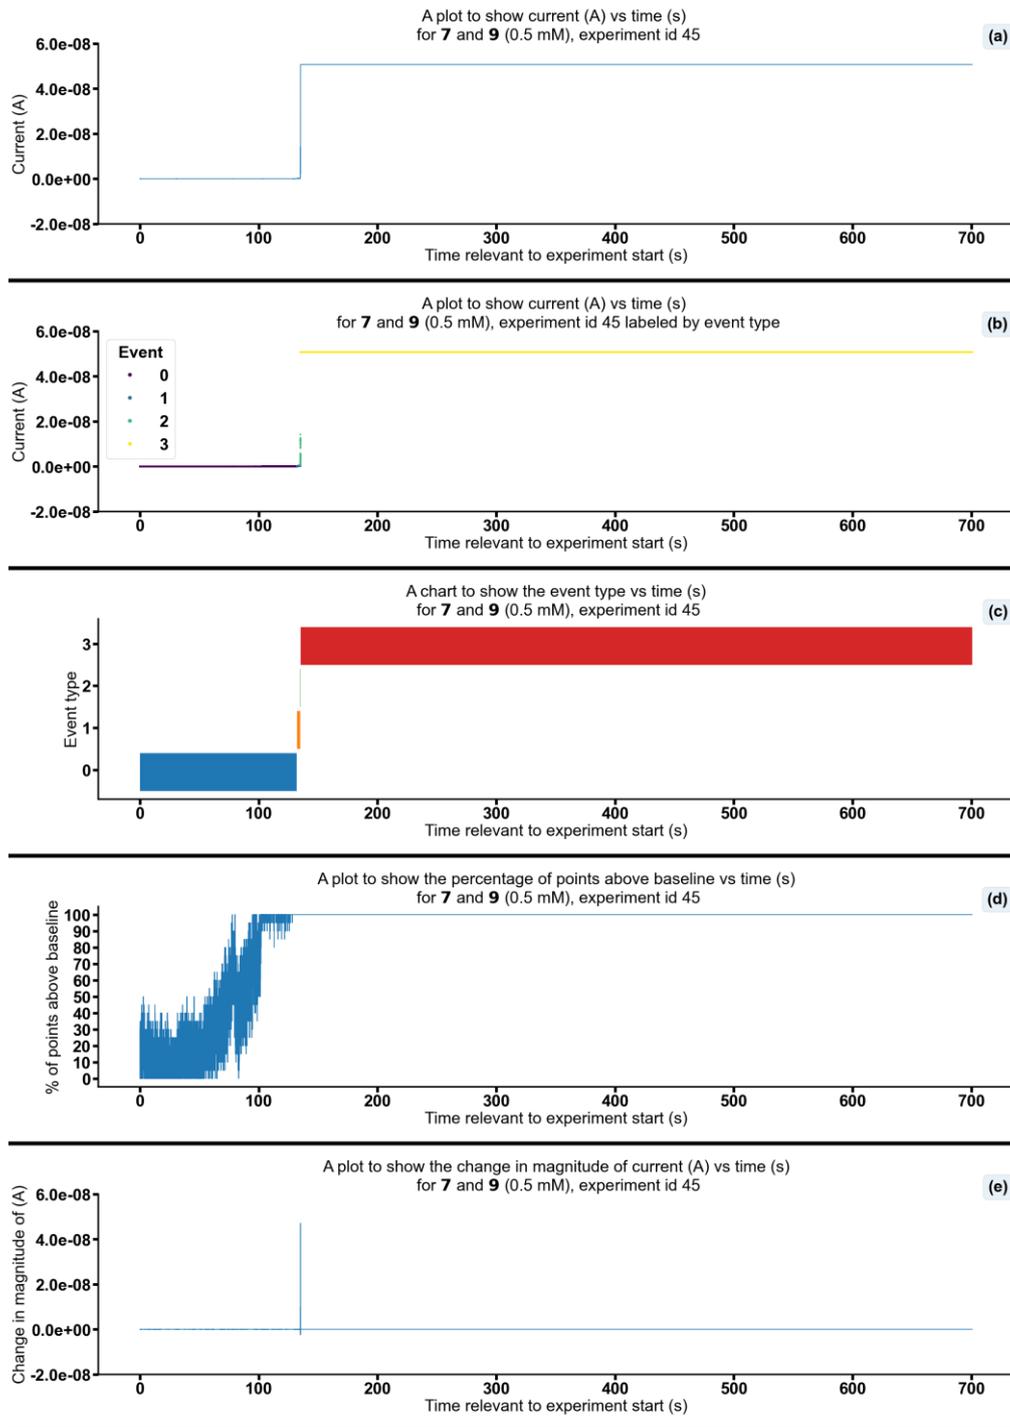

Figure S304 - Summarising the data from the patch clamp experiment for 7 and 9 (0.5 mM), experiment id 45 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.8 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

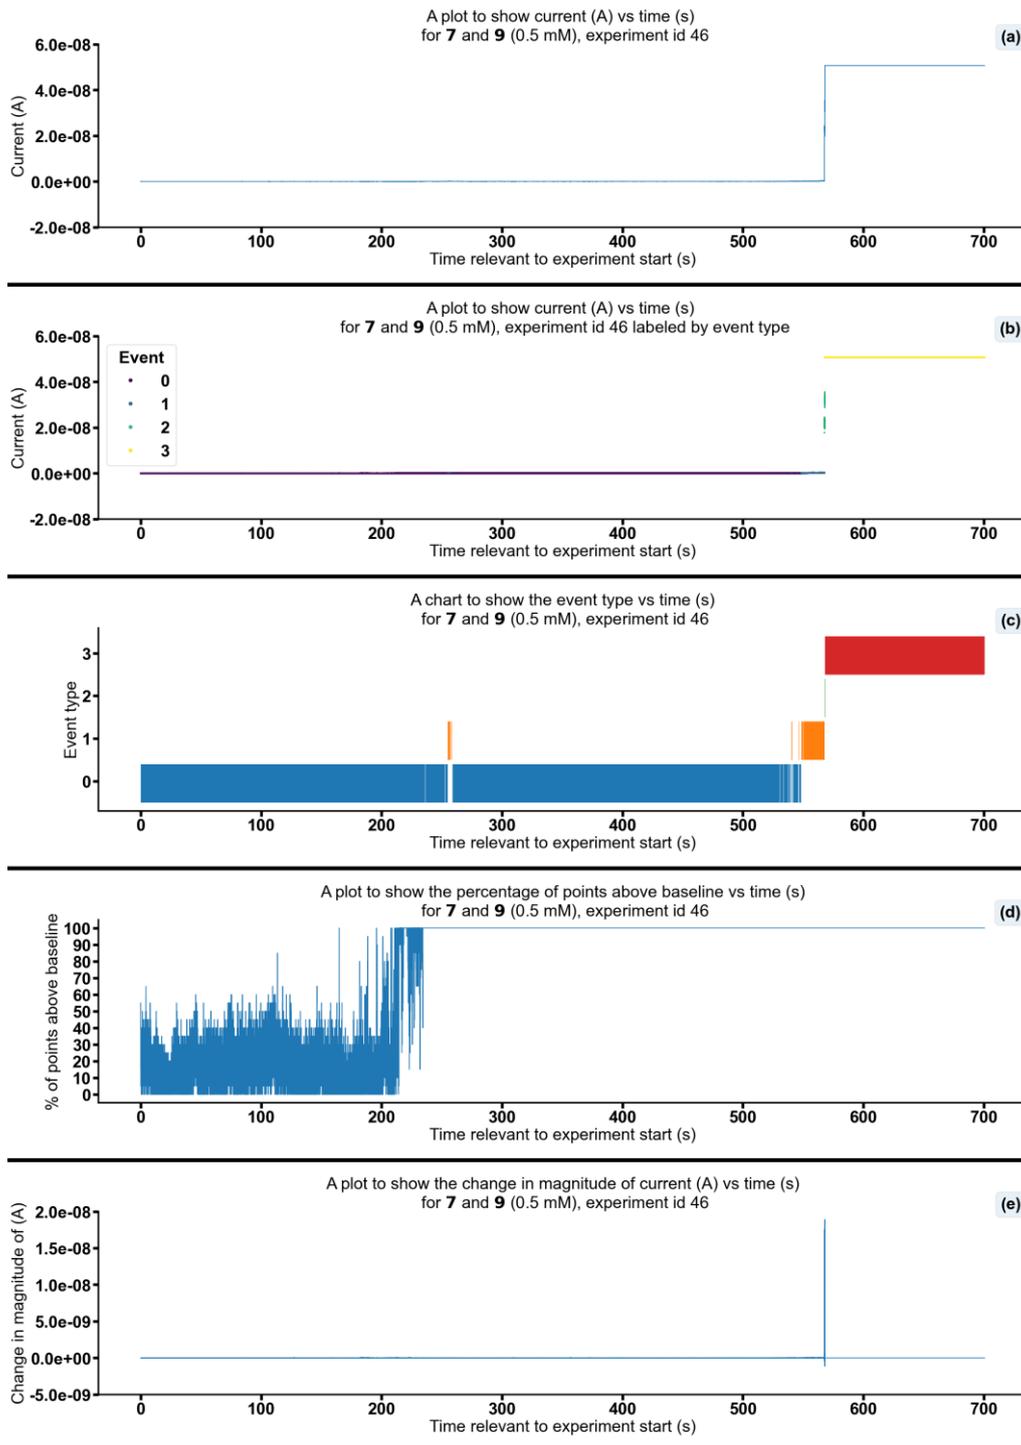

Figure S305 - Summarising the data from the patch clamp experiment for 7 and 9 (0.5 mM), experiment id 46 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event}$ 0 < $5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event}$ 1 < $5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event}$ 2 < $4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event}$ 3 < $\infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.4 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Control experiments

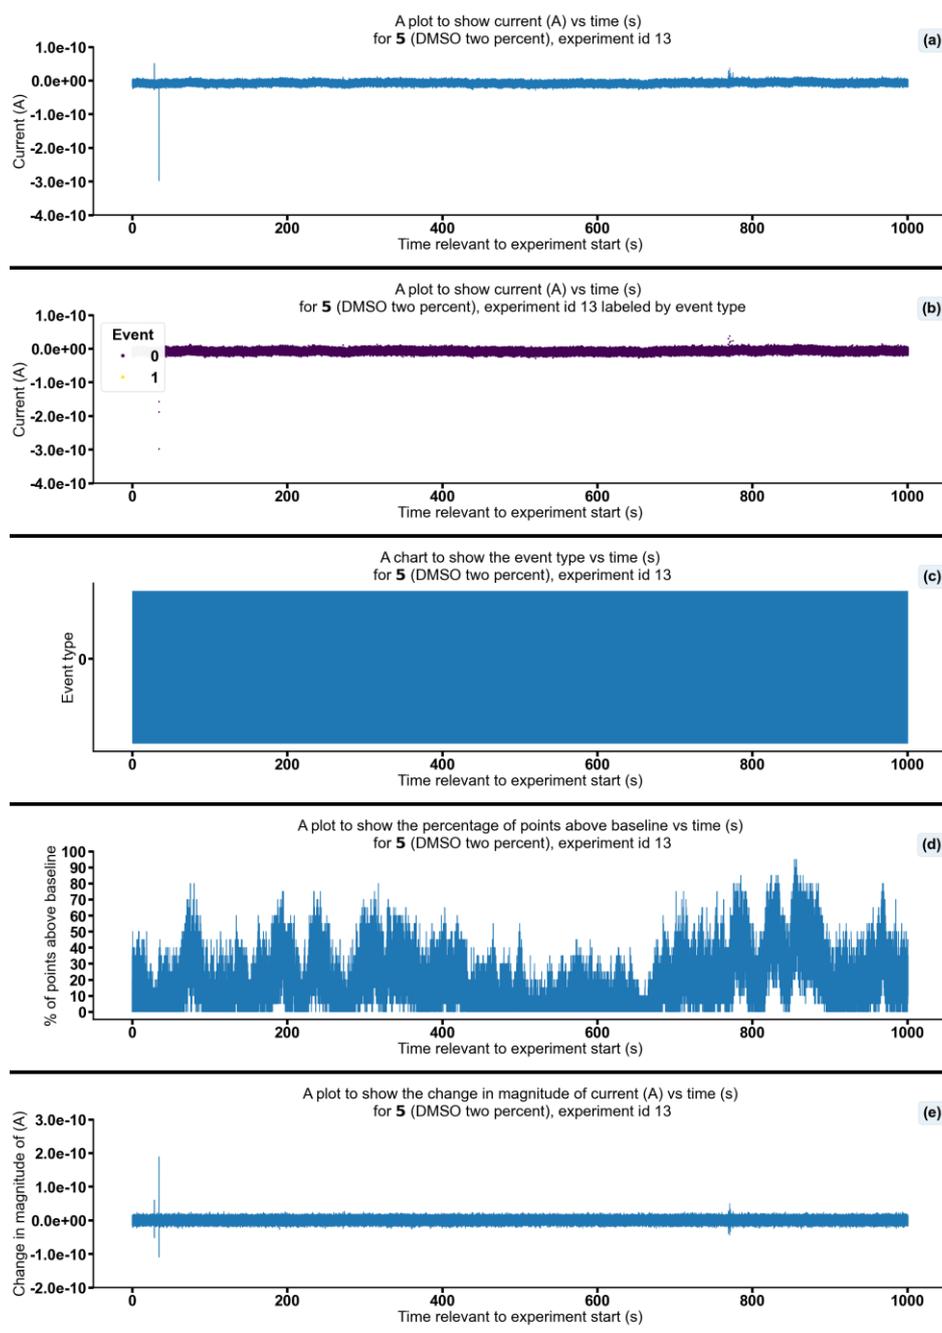

Figure S306 - Summarising the data from the patch clamp experiment for the DMSO two percent control (no SSA was present during the running of this experiment), experiment id 13 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold - $4.4 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

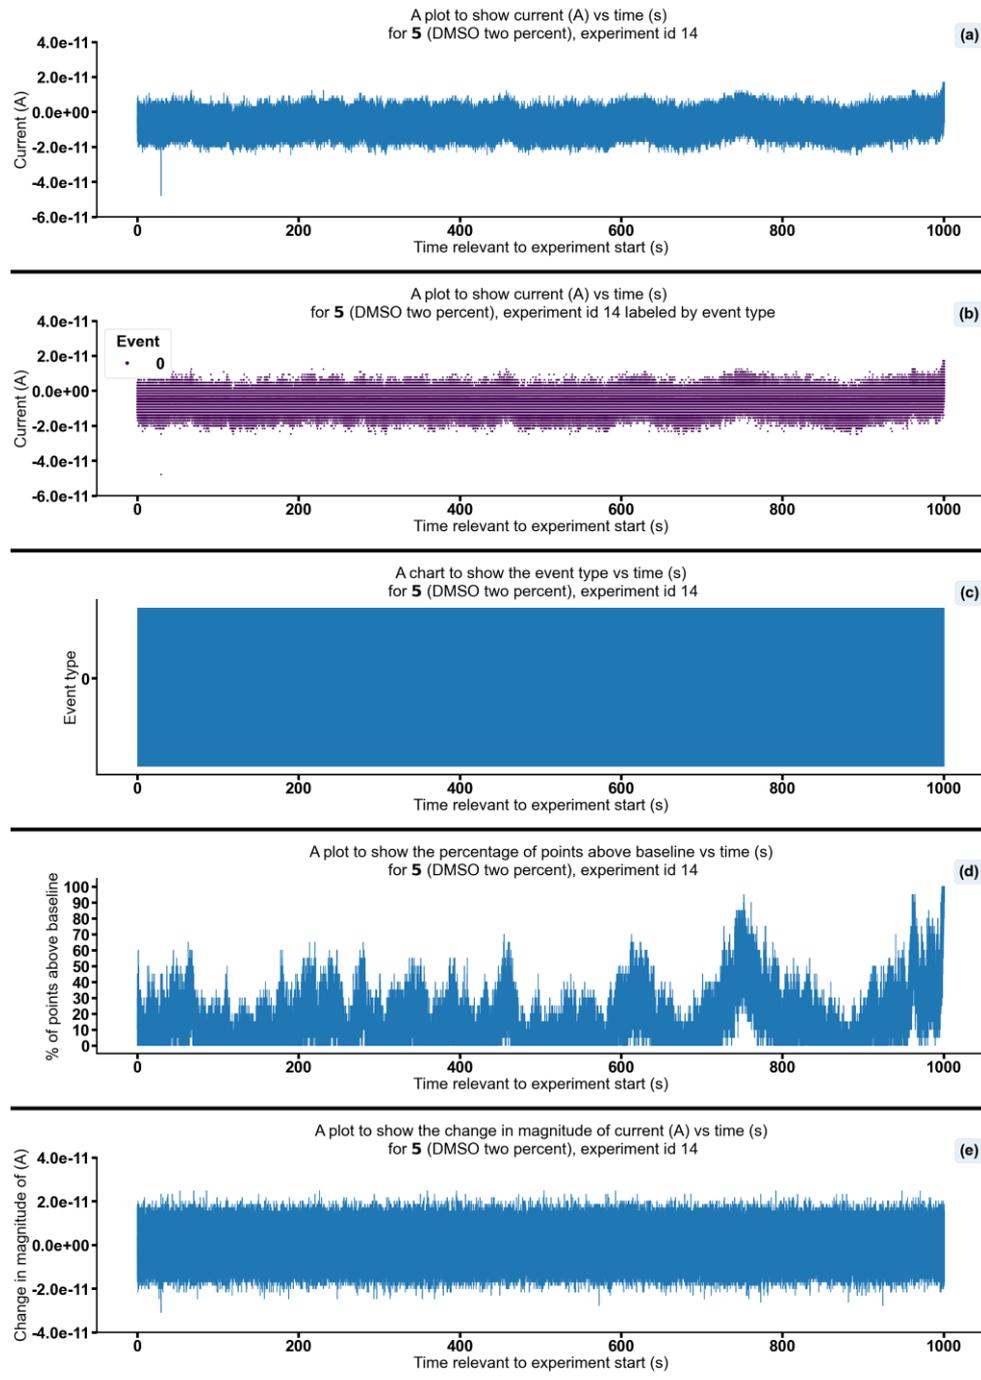

Figure S307 - Summarising the data from the patch clamp experiment for the DMSO two percent control (no SSA was present during the running of this experiment), experiment id 14 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-1.9 \times 10^{-12} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

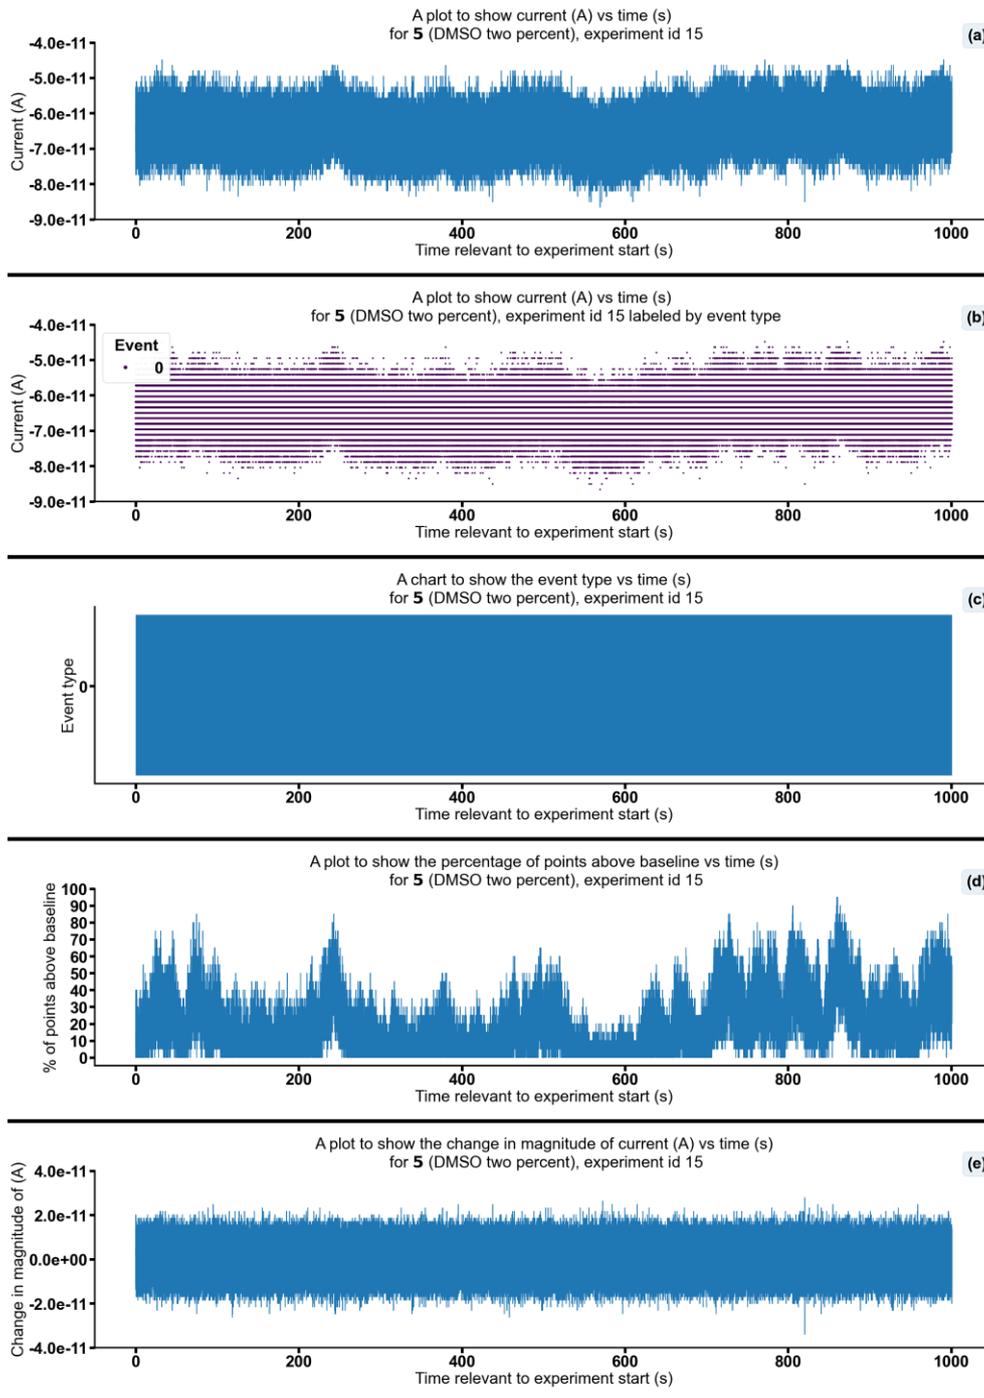

Figure S308 - Summarising the data from the patch clamp experiment for the DMSO two percent control (no SSA was present during the running of this experiment), experiment id 15 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event } 0 < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event } 1 < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event } 2 < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event } 3 < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-6.1 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

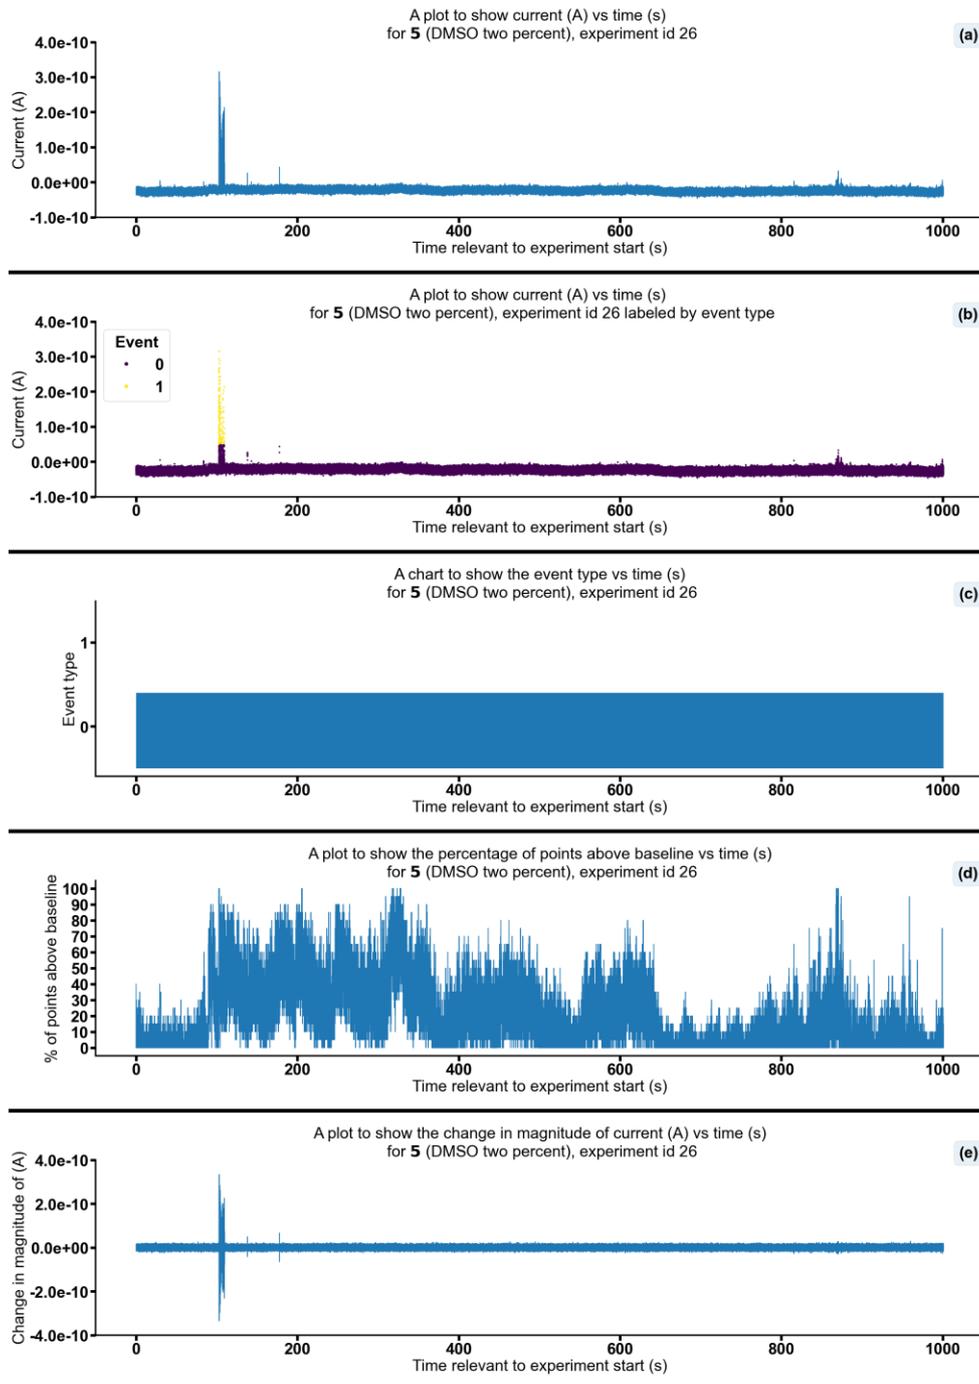

Figure S309 - Summarising the data from the patch clamp experiment for the DMSO two percent control (no SSA was present during the running of this experiment), experiment id 26 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-08} \text{ A}$, 3: $4.90 \times 10^{-08} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold $-2.0 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

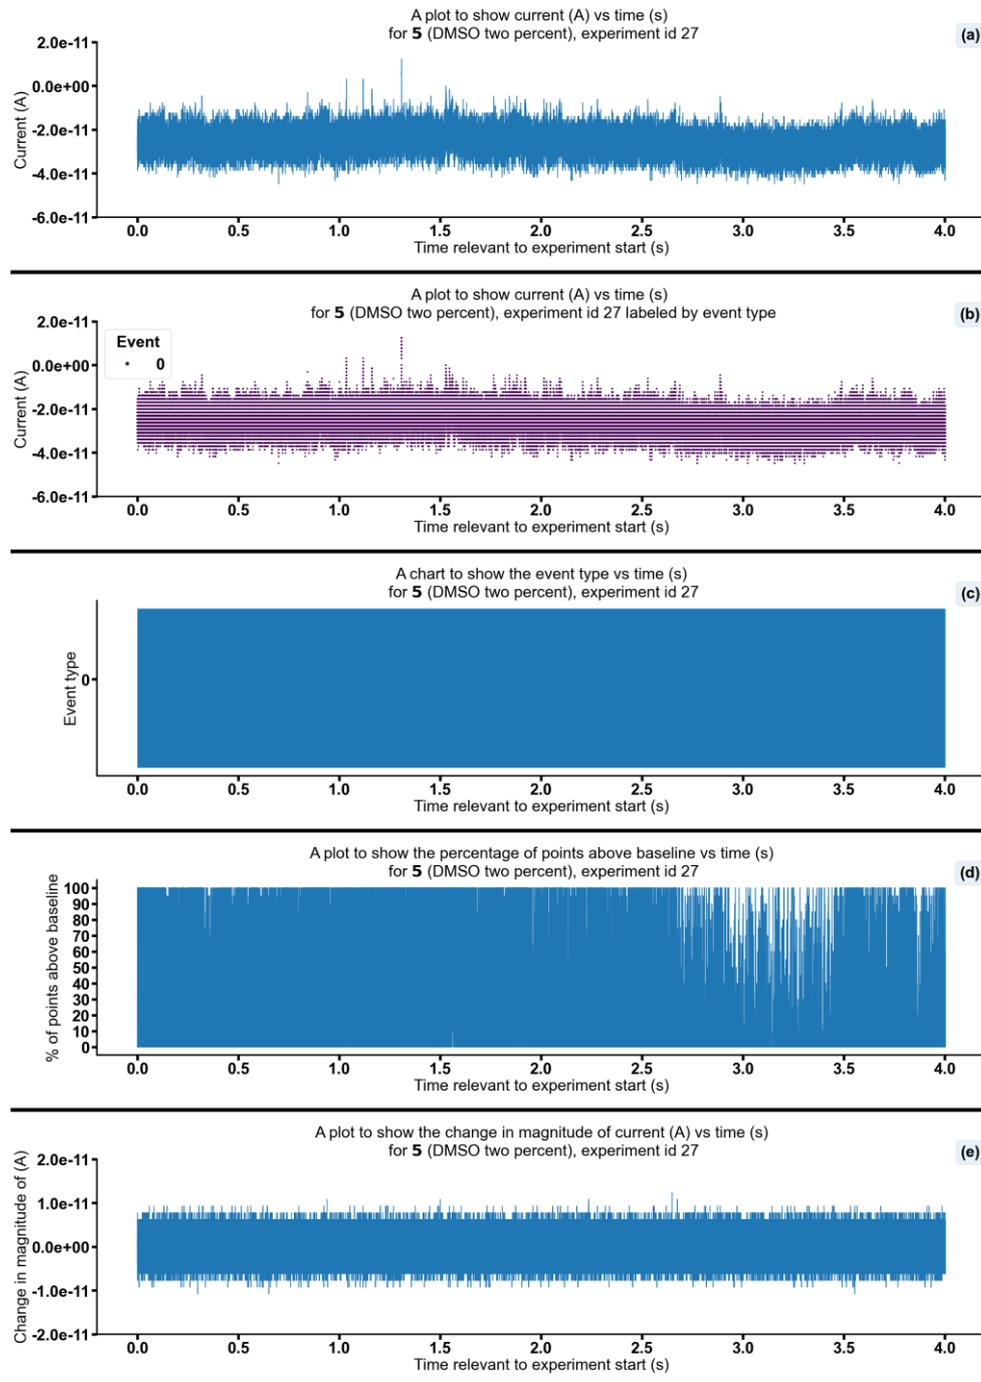

Figure S310 - Summarising the data from the patch clamp experiment for the DMSO two percent control (no SSA was present during the running of this experiment), experiment id 27 at +100 mV. Events were categorised into the following types: 0: $-\infty \text{ A} \leq \text{Event 0} < 5.00 \times 10^{-11} \text{ A}$, 1: $5.00 \times 10^{-11} \text{ A} \leq \text{Event 1} < 5.00 \times 10^{-10} \text{ A}$, 2: $5.00 \times 10^{-10} \text{ A} \leq \text{Event 2} < 4.90 \times 10^{-8} \text{ A}$, 3: $4.90 \times 10^{-8} \text{ A} \leq \text{Event 3} < \infty \text{ A}$. Subfigure (d) shows the percentage of points found above the threshold - $2.2 \times 10^{-11} \text{ (A)}$ in a rolling look ahead window of 20 points. The threshold is the mean + standard deviation of the noise of the first 200 datapoints.

Magnified portions of patch clamp data sets

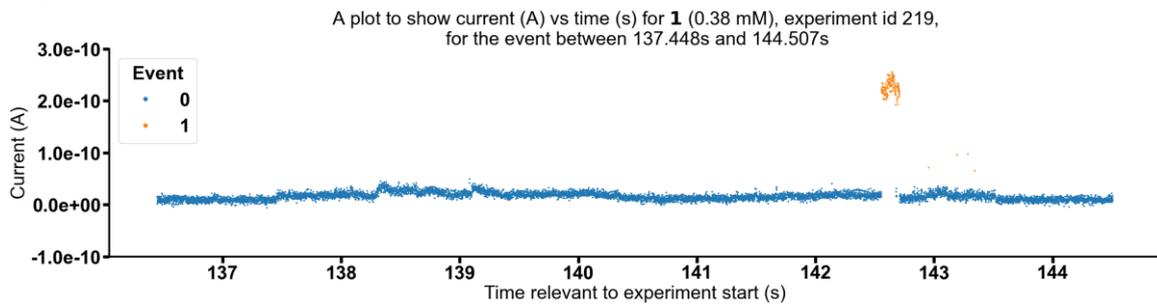

Figure S311 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 219 at +100 mV, for the event between 137.448s and 144.507s.

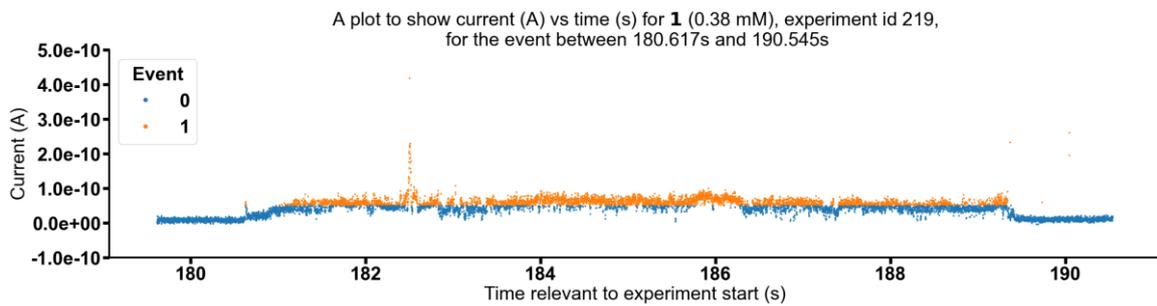

Figure S312 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 219 at +100 mV, for the event between 180.617s and 190.545s.

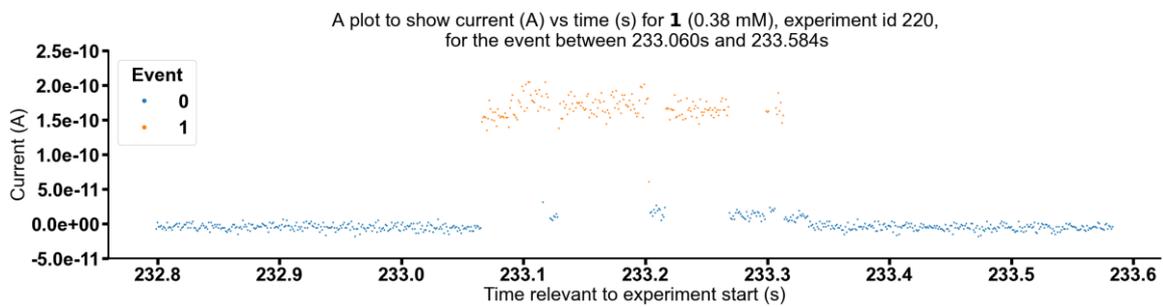

Figure S313 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 220 at +100 mV, for the event between 233.060s and 233.584s.

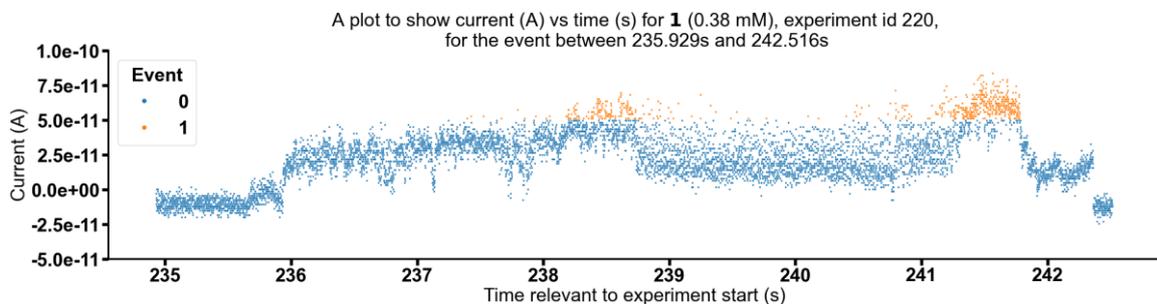

Figure S314 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 220 at +100 mV, for the event between 235.929s and 242.516s.

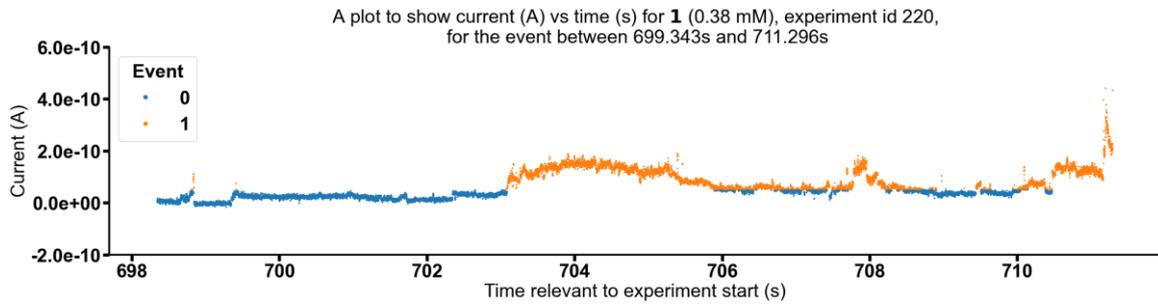

Figure S315 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 220 at +100 mV, for the event between 699.343s and 711.296s.

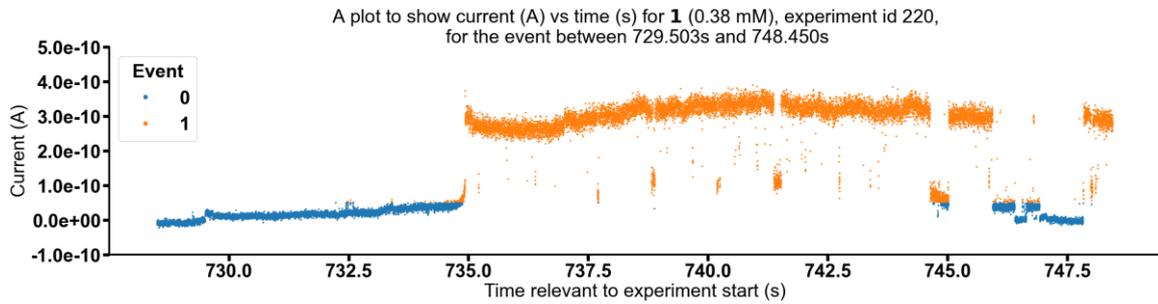

Figure S316 - Graph showing current (A) vs time (s) for **1** (0.38 mM), experiment id 220 at +100 mV, for the event between 729.503s and 748.450s.

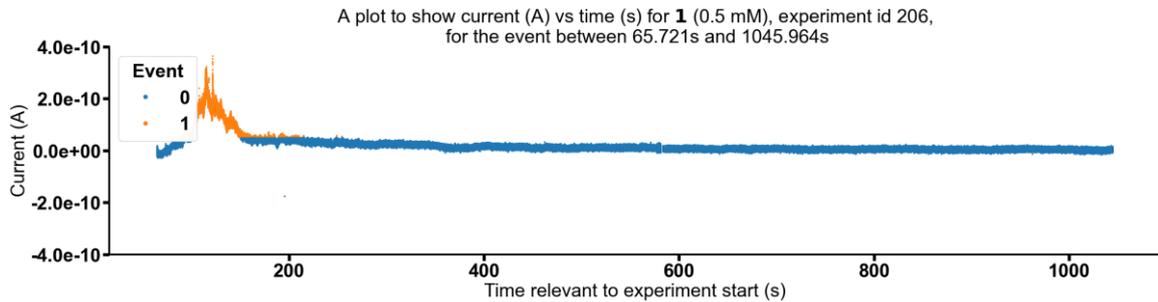

Figure S317 - Graph showing current (A) vs time (s) for **1** (0.5 mM), experiment id 206 at +100 mV, for the event between 65.721s and 1045.964s.

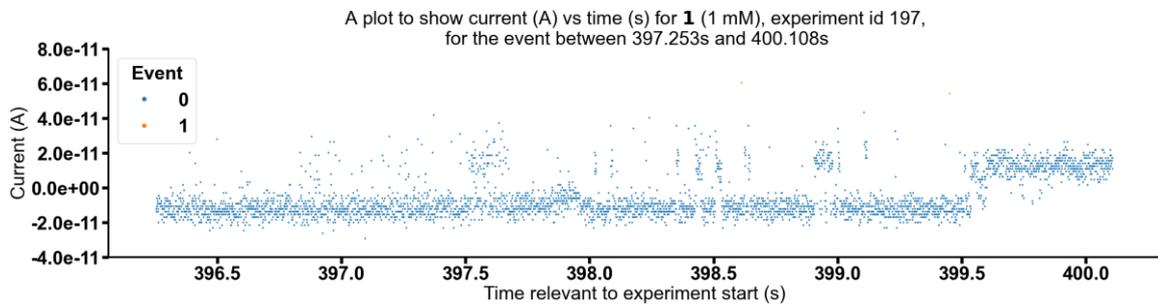

Figure S318 - Graph showing current (A) vs time (s) for **1** (1 mM), experiment id 197 at +100 mV, for the event between 397.253s and 400.108s.

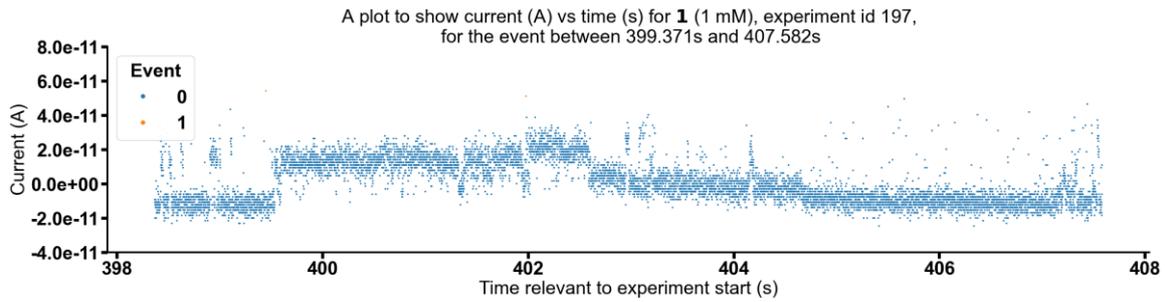

Figure S319 - Graph showing current (A) vs time (s) for **1** (1 mM), experiment id 197 at +100 mV, for the event between 399.371s and 407.582s.

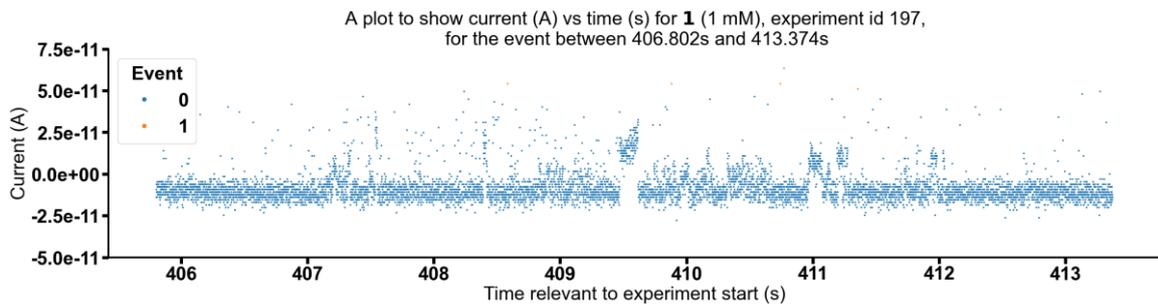

Figure S320 - Graph showing current (A) vs time (s) for **1** (1 mM), experiment id 197 at +100 mV, for the event between 406.802s and 413.374s.

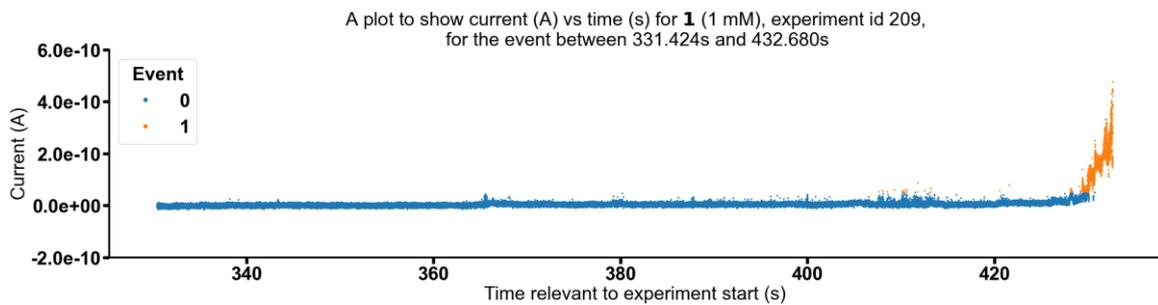

Figure S321 - Graph showing current (A) vs time (s) for **1** (1 mM), experiment id 209 at +100 mV, for the event between 331.424s and 432.680s.

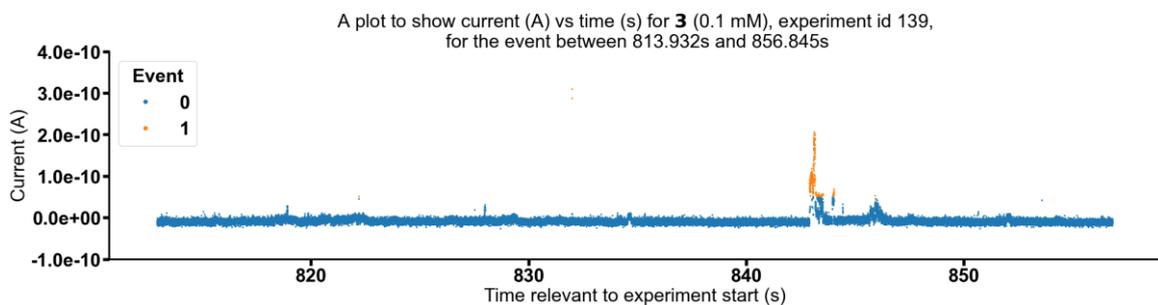

Figure S322 - Graph showing current (A) vs time (s) for **3** (0.1 mM), experiment id 139 at +100 mV, for the event between 813.932s and 856.845s.

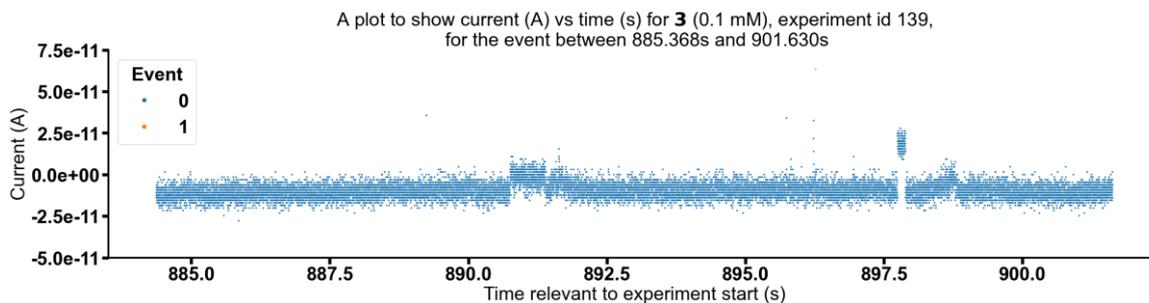

Figure S323 - Graph showing current (A) vs time (s) for **3** (0.1 mM), experiment id 139 at +100 mV, for the event between 885.368s and 901.630s.

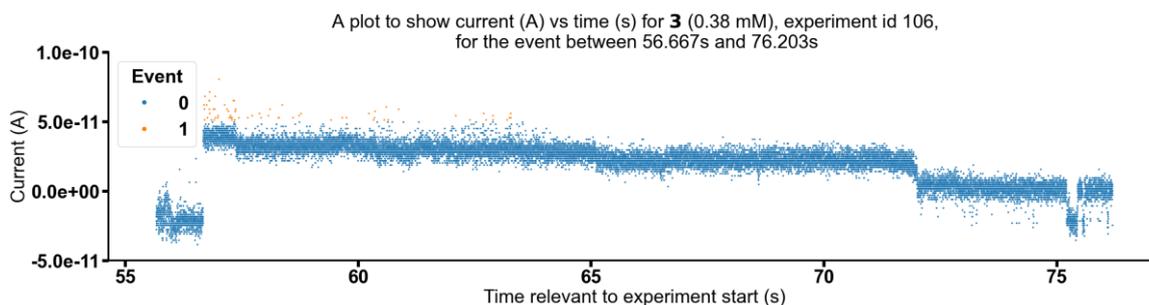

Figure S324 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 56.667s and 76.203s.

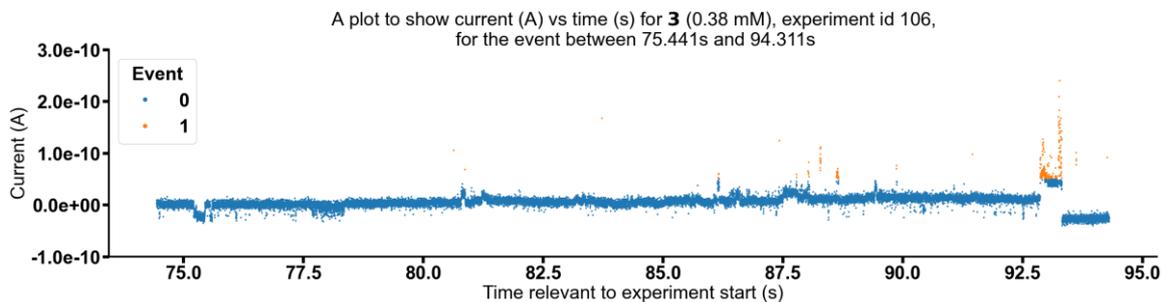

Figure S325 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 75.441s and 94.311s.

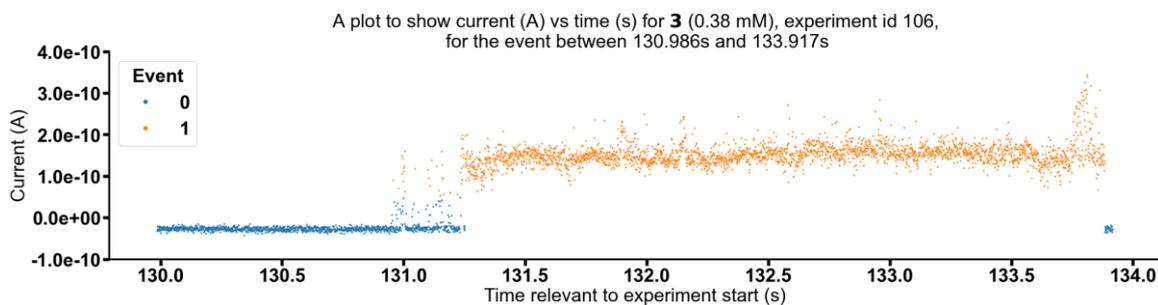

Figure S326 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 130.986s and 133.917s.

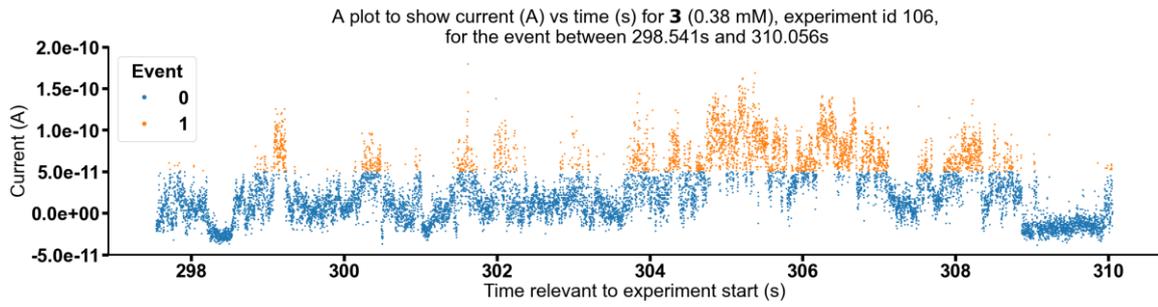

Figure S327 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 298.541s and 310.056s.

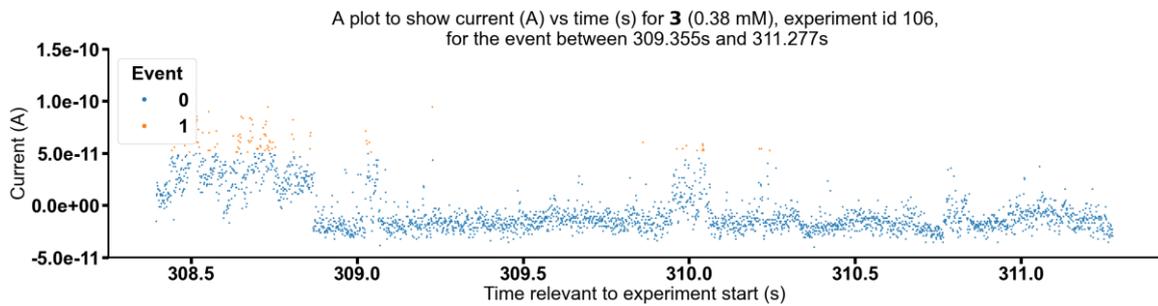

Figure S328 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 309.355s and 311.277s.

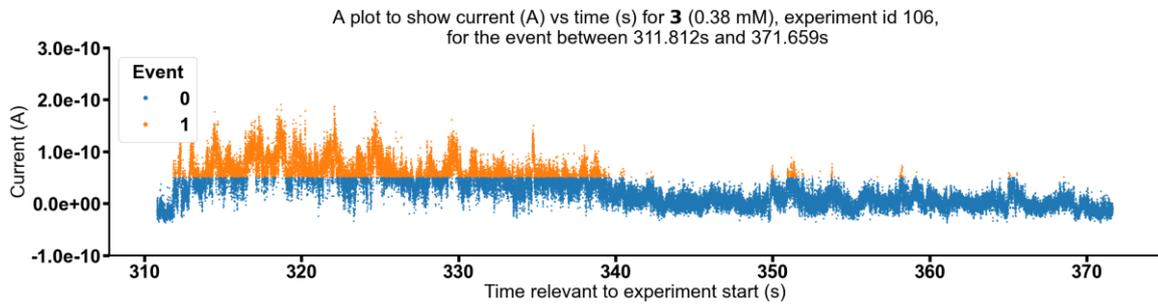

Figure S329 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 311.812s and 371.659s.

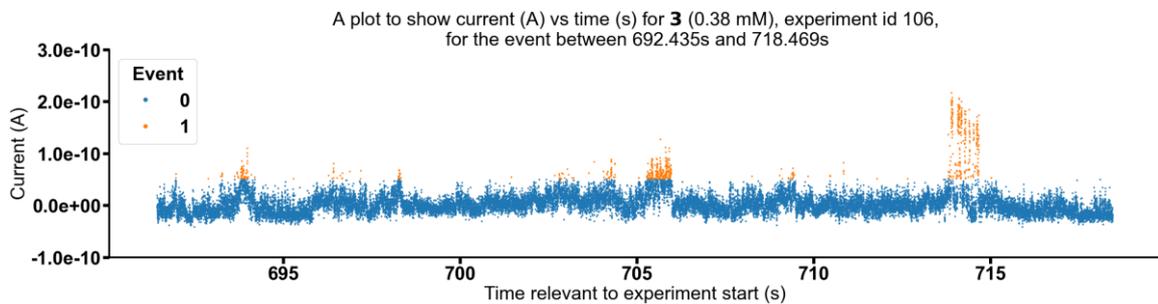

Figure S330 - Graph showing current (A) vs time (s) for **3** (0.38 mM), experiment id 106 at +100 mV, for the event between 692.435s and 718.469s.

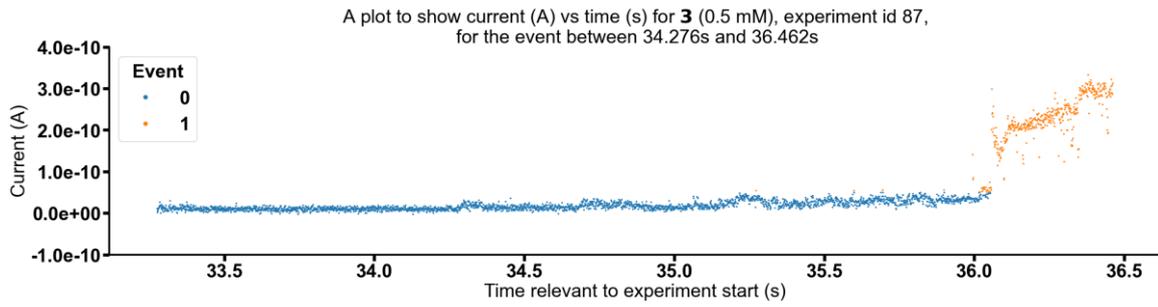

Figure S331 - Graph showing current (A) vs time (s) for **3** (0.5 mM), experiment id 87 at +100 mV, for the event between 34.276s and 36.462s.

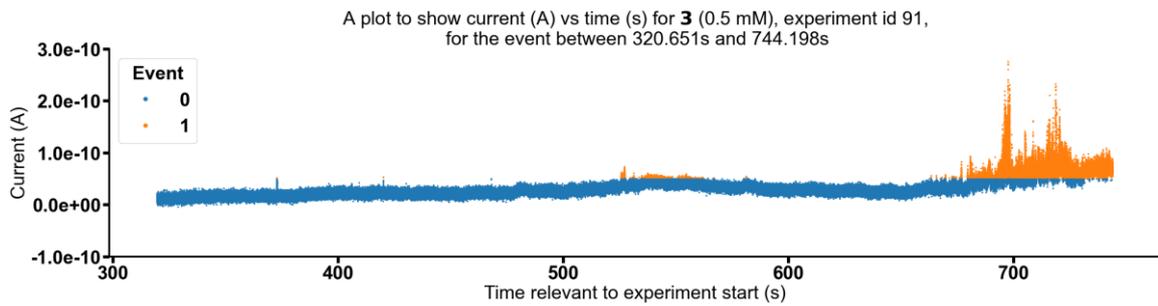

Figure S332 - Graph showing current (A) vs time (s) for **3** (0.5 mM), experiment id 91 at +100 mV, for the event between 320.651s and 744.198s.

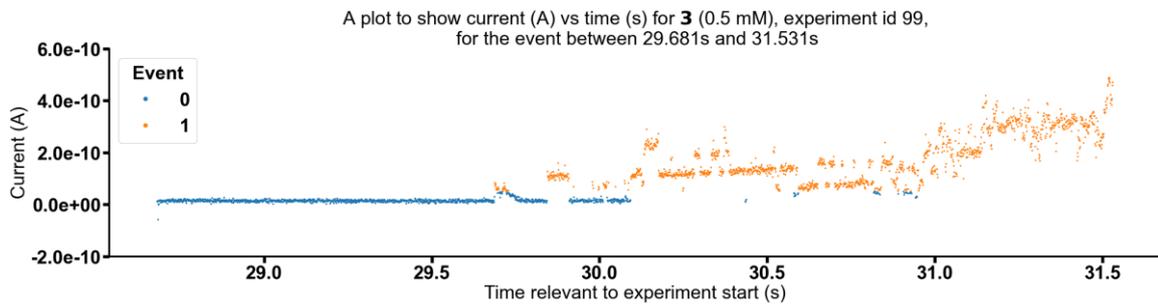

Figure S333 - Graph showing current (A) vs time (s) for **3** (0.5 mM), experiment id 99 at +100 mV, for the event between 29.681s and 31.531s.

Section S25: DFT SSA-Model Lipid Interaction Calculations

As the headgroup of a phospholipid is expected to be the main portion interacting with the SSAs, modelling of phospholipids was performed on truncated structures as used previously.⁷ However, as steric interactions were expected to be more significant in influencing the discrepancies between enantiomers, larger model lipids were used in this study. The structures of the simplified model lipid headgroups is shown in Figure S456.

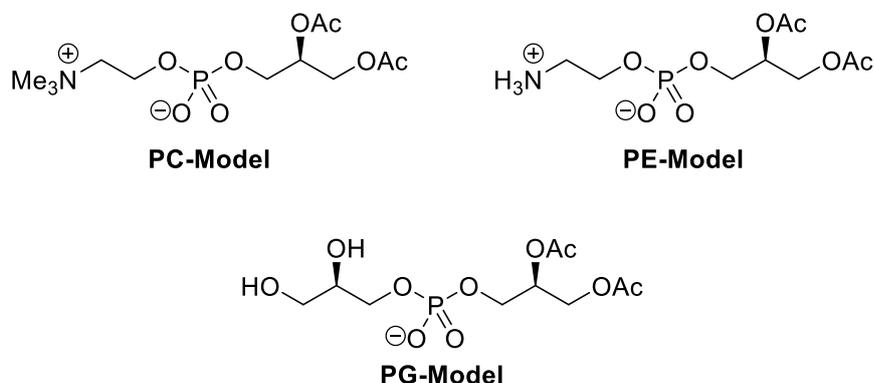

Figure S456 – Model phospholipid headgroups

The overall model we have selected simplifies the problem of SSA-bilayer interactions to the interactions between a single SSA and a single lipid headgroup. The simplified model operates at the assumption of high (infinite) dilution, and whilst it cannot provide detailed energetic information about interactions of an isolated SSA with a lipid bilayer, nor between a larger SSA aggregate with a lipid bilayer, the energies of diastereomeric interactions between SSA and lipid do allow insight into the extent to which lipid/SSA chirality may be of significance.

A conformation search for **7** about the 2 rotatable bonds of the urea moiety, and the C-N and C-C bonds in the backbone of the phenylalanine moiety was performed at the PM6 level using a COSMO(water) solvent model in Gaussian16;⁸ the C-aryl and C-CO₂ bonds were allowed to freely relax in each case. The geometry was then reoptimized at the M06-2X/6-311+g(d,p) level with a PCM(water) solvation model. The M06-2X functional was chosen it includes a dispersion consideration and has been shown to be effective at modelling hydrogen bonding to anions.⁹ The linear, “open” form (as required for interaction with a phospholipid head group) was similarly optimised. The lowest energy isomer in the absence of an explicit cation was found to be, as expected, the one with intramolecular hydrogen bonding between the urea-moiety and the carboxylate group. The energy cost, ΔH , for unfolding to the linear form was 32.3 kJ. mol⁻¹ ($\Delta G = 28.2$ kJ. mol⁻¹), indicating that even in the absence of an additional interaction at infinite dilution, the linear form is thermally accessible at ambient temperature and the SSA will be available for binding. The geometries were then inverted for subsequent calculations involving **9**. The geometry of the model phospholipid were optimised in the broadly linear geometry required for SSA/Lipid interactions at the M06-2X/ 6-311+g(d,p) level with a PCM(water) solvation model. All structures were confirmed as energy minima by the absence of any imaginary frequencies.

A range of SSA-headgroup interaction conformations were then optimised using the same computational parameters. The binding energy for each SSA-headgroup conformation was then calculated using Equation S1 – the energies were obtained from the output files and converted from Hartree to $\text{kJ}\cdot\text{mol}^{-1}$. All calculated binding energies are shown in Table S24. Cartesian coordinates for the minimised binding conformations are given in Tables S25-35 and 3D visualisations of the structures are shown in Figures S457-467.

$$\text{SSA-headgroup binding energy} = \text{SSA-headgroup energy} - (\text{SSA energy} + \text{headgroup energy})$$

Equation S1

Table S24 – Energies of interaction between **7** and **9**, and Phospholipid Models

Interaction	Binding Energy / $\text{kJ}\cdot\text{mol}^{-1}$	
	ΔH	ΔG
7 / PC-Model	-95.2	-30.7
9 / PC-Model	-110.8	-31.4
7 / PE-Model	-160.8	-83.1
9 / PE-Model	-133.2	-70.2
7 / PG-Model	-79.5	-17.0
9 / PG-Model	-102.1	-37.9

These results indicate that binding is exothermic in all cases, even for the SSA/PG-model interactions which are formally anion/anion events; all binding events are also exergonic, albeit to a lesser extent as expected for the decrease in entropy when two molecules come together. In each case, the binding geometry involves the two P-O groups oriented towards the urea N-H whilst the carboxylate group is closely associated with the cationic (PC, PE) or neutral (PG) head group. The significant increase in exergonicity between binding PC and PE can be attributed to not only the closer approach of carboxylate to ammonium centre permitted by the reduction in steric hindrance as methyl groups are replaced by protons but also the formation of O-HN hydrogen bonds. The differences in energy between diastereomeric model complexes range from $0.7 \text{ kJ}\cdot\text{mol}^{-1}$ to $20.9 \text{ kJ}\cdot\text{mol}^{-1}$, and show significant differences between phospholipid headgroups, indicating both that SSA chirality may induce significant changes in behaviour and that this may be used to enhance selectivity for different cell membrane compositions.

Section S26: *In vitro* Drug Metabolism and Pharmacokinetics (DMPK) studies

Protein Binding Measurements in Human Plasma by Using Equilibrium Dialysis

Table S36 - Protein binding results of **9** and control compound in human plasma.

Compound	Species	% Bound	% Unbound	% Recovery	% Remaining at 6 hr
Ketoconazole	Human	99.14	0.86	96.60	101.17
9	Human	99.73	0.27	98.35	98.85

Kinetic Solubility Determination in PBS pH 7.4

Table S37 - The solubility data of **9** and control in PBS pH 7.4. The upper limit was set at 300 μ M. Any value close to or above 300 μ M indicates that the compound may have a solubility at or above 300 μ M.

Compound	Solubility in PBS pH 7.4 (μ M)
Progesterone	14.52
Diclofenac	280.79
9	271.13

Metabolic Stability in Rat and Mouse Liver Microsomes

Table S38 - Metabolic stability of **9** and control compound in rat and mouse liver microsomes.

Compound	Species	<i>in vitro</i> $t_{1/2}$ (min)	<i>in vitro</i> CL_{int} (μ L/min/mg)	Scale-up CL_{int} (mL/min/Kg)	Predicted Hepatic CL_H (mL/min/kg)	Hepatic Extraction Ratio (ER)
Verapamil	Rat	2.40	577.23	1408.44	64.87	0.95
	Mouse	1.96	708.93	2932.13	87.32	0.97
SSA 9	Rat	> 184.78	< 7.50	< 18.30	< 14.42	< 0.21
	Mouse	> 184.78	< 7.50	< 31.02	< 23.07	< 0.26

Table S39 - Remaining percentage of **9** and control compound in rat and mouse liver microsomes

Compound	Species	Assay format	Remaining percentage (%)				
			0.5 min	5 min	15 min	30 min	60 min
Verapamil	Rat	+Cofactors	100.00	27.30	3.04	BLOD	BLOD
		-Cofactors	100.00	-	-	-	99.51
	Mouse	+Cofactors	100.00	20.30	2.54	BLOD	BLOD
		-Cofactors	100.00	-	-	-	103.42
SSA 9	Rat	+Cofactors	100.00	107.16	104.62	102.68	102.41
		-Cofactors	100.00	-	-	-	107.67
	Mouse	+Cofactors	100.00	101.43	97.80	99.51	99.55
		-Cofactors	100.00	-	-	-	101.52

Bidirectional Permeability in Caco-2 Cell Line

Table S40 - Permeability results of **9** and control compounds in the Caco-2 cell line.

Compound	P_{app} (A-B) (10^{-6} , cm/s)	P_{app} (B-A) (10^{-6} , cm/s)	Efflux Ratio	Recovery (%) AP-BL	Recovery (%) BL-AP
Metoprolol	28.43	26.41	0.93	107.79	98.96
Digoxin	0.42	18.74	45.59	95.92	99.20
SSA 9	0.17	16.76	96.91	110.78	97.74

Table S41 - The assessment of Caco-2 cell monolayer integrity.

Compound	TEER A-B ($\Omega \times \text{cm}^2$)	TEER B-A ($\Omega \times \text{cm}^2$)	LY Leakage A-B (%)	LY Leakage B-A (%)
Metoprolol	751.82	821.75	0.13	0.15
Digoxin	732.02	768.48	0.14	0.15
SSA 9	686.19	773.63	0.15	0.14

Section S27: SEM Images

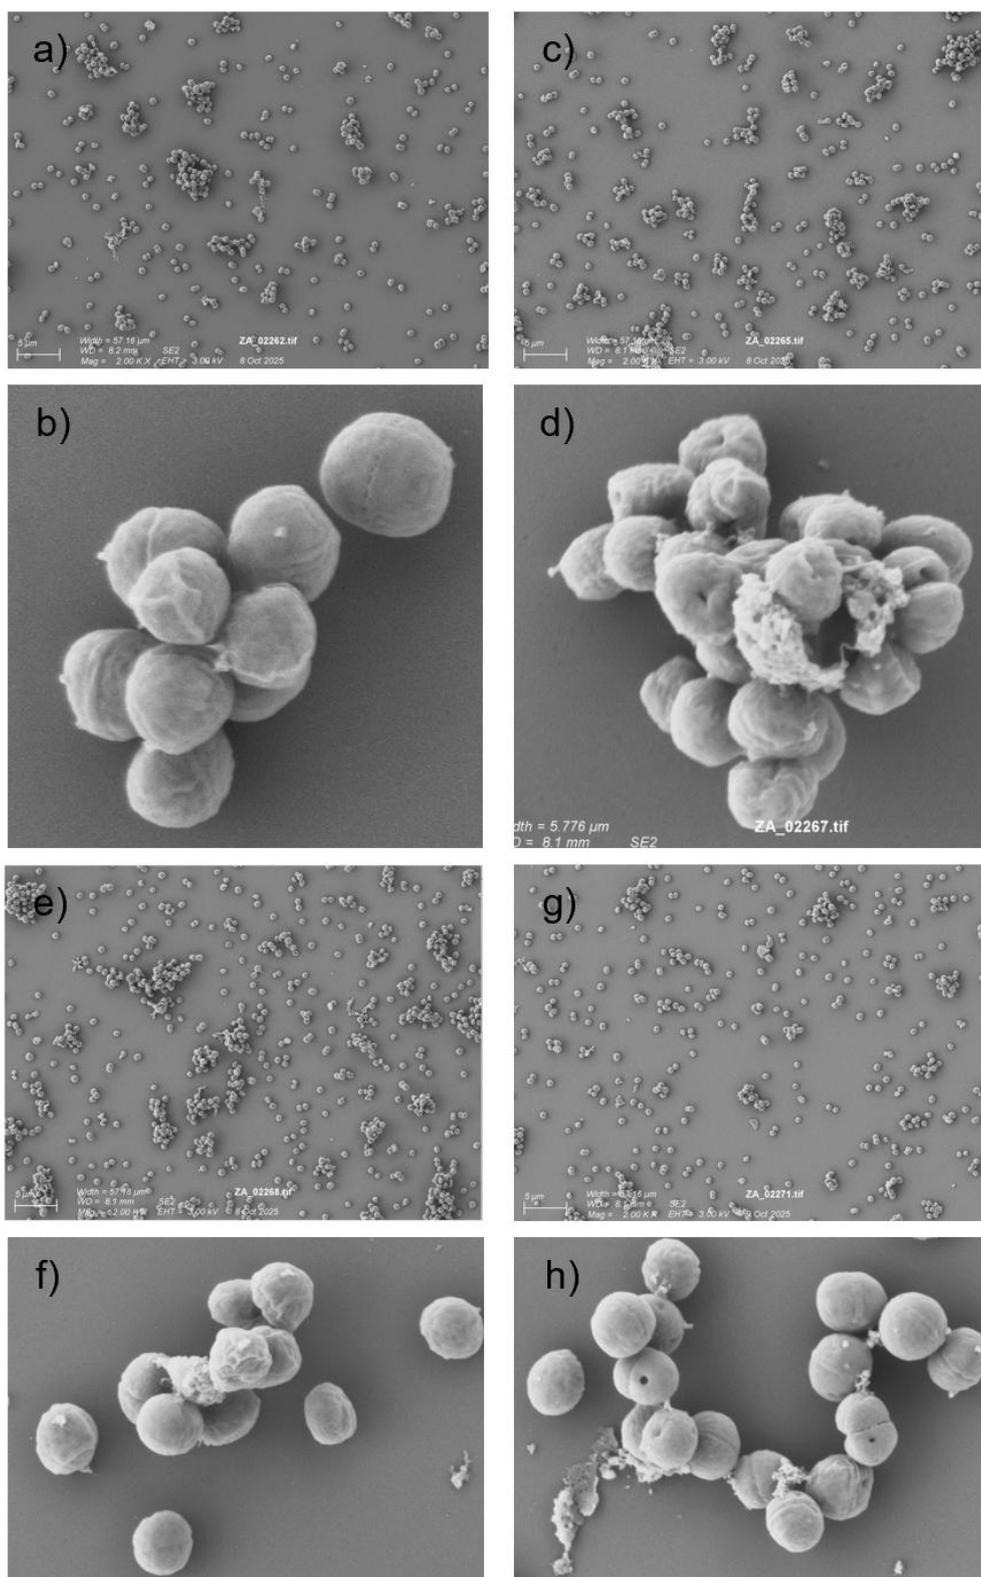

Figure S468 – SEM images of ATCC 9144 in the absence of SSA (a and b), in the presence of 7 (c and d), in the presence of 9 (e and f), in the presence of a 1:1 enantiomeric mixture of 9 + 7 (g and h).

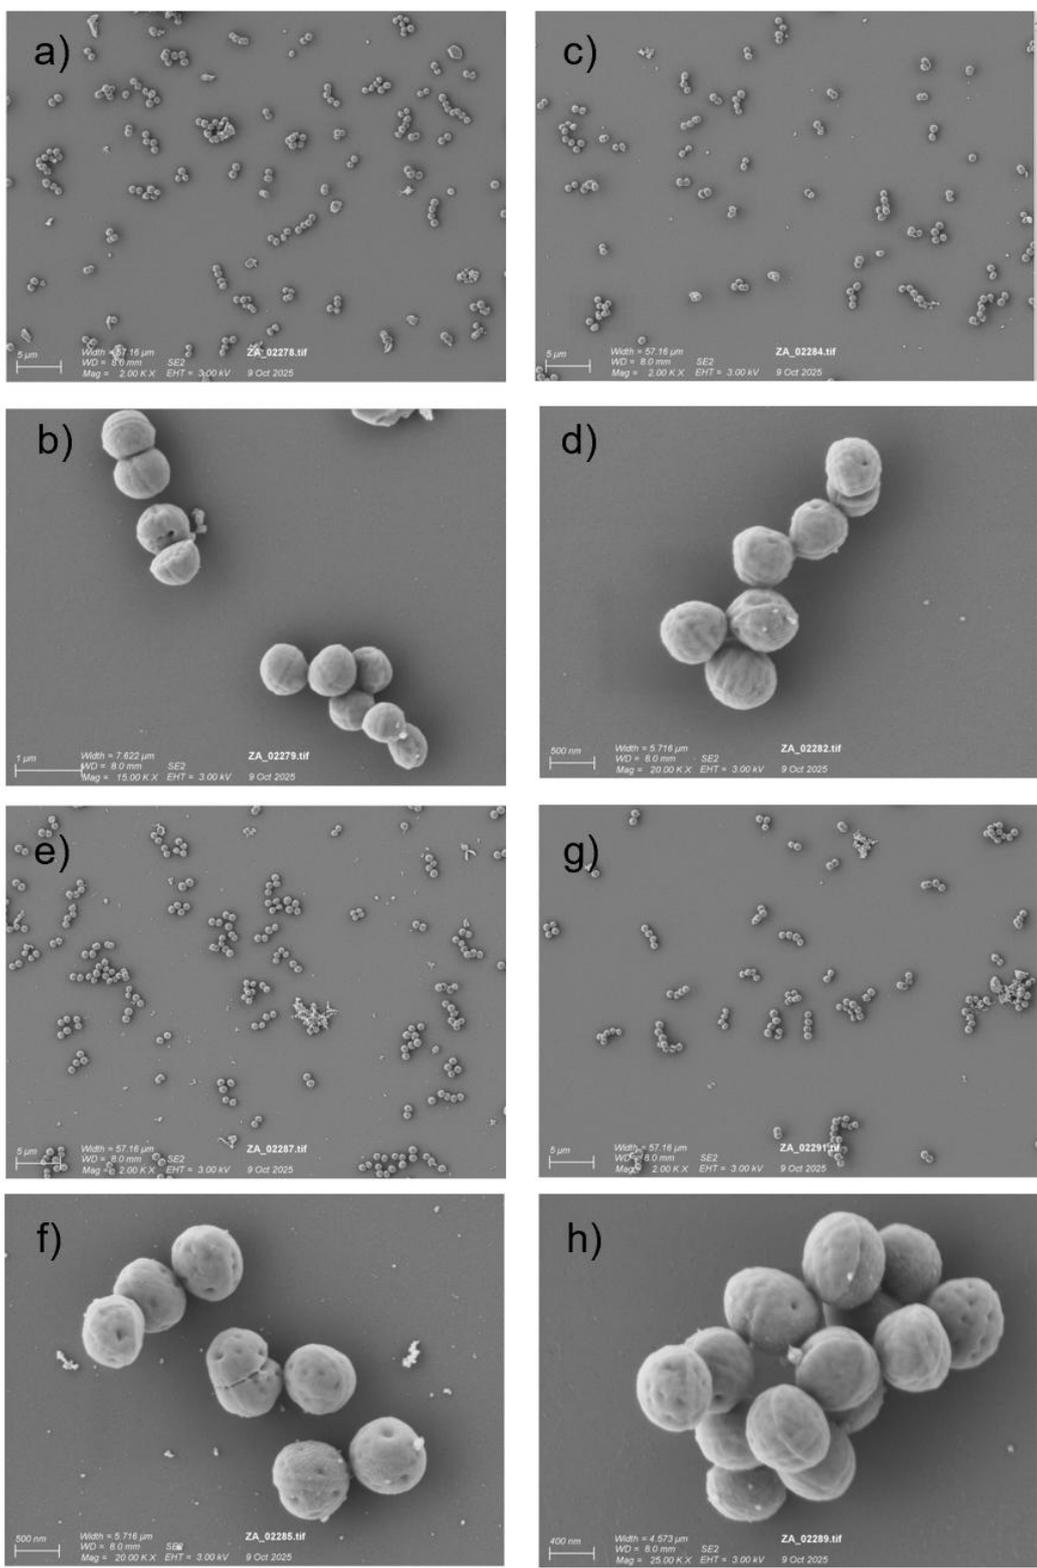

Figure S469 – SEM images of USA300 in the absence of SSA (a and b), in the presence of **7** (c and d), in the presence of **9** (e and f), in the presence of a 1:1 enantiomeric mixture of **9** + **7** (g and h).
