1. General Information

All reagents were purchased from commercial resources and were used without further purification. ^1H and ^{13}C NMR spectra were recorded on a Bruker 400 AVANCE spectrometer. Mass spectrum (MS) was recorded on an Agilent 6550 iFunnel Q-TOF Spectrometer. Infrared (IR) spectra were measured on a Perkin-Elmer Spectrum II IR Spectrometers using KBr pellets. Densities (ρ) were determined by a Micromeritics Accupyc II 1340 gas pycnometer at room temperature. Thermal decomposition temperatures (T_d) were determined by using differential scanning calorimetry (DSC) and thermogravimetry (TG) analyses on a Mettler-Toledo TG-DSC 1 Star^e system from 50 °C to 400 °C under the nitrogen atmosphere. Detonation velocity (D_v) and detonation pressure (P) were calculated by using the EXPL05 (version 6.02) code. Impact sensitivity (IS) and friction sensitivity (FS) were measured on a standard BAM fall hammer and a BAM friction tester. Electrostatic potential (ESP) surfaces and Interaction region indicator (IRI) analysis were calculated and analyzed by using Gaussian 09 (Revision D.01), Multiwfn (version 3.8) and Visual Molecular Dynamics (VMD, version 1.9.2) program suites [S1-S5]. Illustrations of crystal structures were analyzed and drawn with Olex2 and Diamond programs [S6, S7].

2. Synthetic Procedure

2.1 Caution

Some products are energetic and sensitive, especially compound **5**, which may explode under certain mechanical stimuli. Therefore, small-scale reactions and appropriate precautions are strongly recommended. Besides, harmful cyanogen bromide is used in the reaction process and needs to be treated in time.

2.2 Synthesis of sodium 3-amino-5-(hydrazinecarbonyl)-1,2,4-triazol-1-ide (**3**)

Compound **2** was obtained according to previous work [S8, S9]. White solid **2** was evenly distributed 20.0 mL ethanol at stirring. Then, sodium hydroxide (1.2 g, 30.0 mmol) in 2.0 mL water was added dropwise. After several minutes, 98% hydrazine hydrate (1.53 g, 30.0 mmol) in 5.0 mL ethanol was dropped slowly to the thick mixture. The mixture was stirred for 2 h at 50 °C or overnight at room temperature, and white precipitate (**3**) was obtained by filtration, followed by washing with a small amount of cold water and ethanol, and drying (82%). ¹H (400 MHz, DMSO-*d*₆): δ=8.24, 6.05, 5.88 ppm. HRMS (ESI⁺, m/z) calcd for C₃H₇N₆O⁺: 143.0676, found: 143.0678; HRMS (ESI⁻, m/z) calcd for C₃H₅N₆O⁻: 141.0530, found: 141.0520.

2.3 Synthesis of 5-(3-amino-1*H*-1,2,4-triazol-5-yl)-1,3,4-oxadiazol-2-amine (**4**)

Compound **3** (2.0 g, 12.2 mmol) was suspended in 15.0 mL ethanol and 5.0 mL water. Then, cyanogen bromide (1.3 g, 12.2 mmol) in 1.0 mL acetonitrile was added dropwise to the mixture. The reaction system was stirred at 50 °C for 24 h. The white precipitate was filtered, washed with water and a small amount of ethanol, and dried in air to give **4** (78%). ¹H (400 MHz, DMSO-*d*₆): δ=7.95, 6.87 ppm; ¹³C (100 MHz, DMSO-*d*₆): δ=163.35, 156.12, 150.91, 144.46 ppm. HRMS (ESI⁺, m/z) calcd for C₄H₆N₇O⁺: 168.0628, found: 168.0631; HRMS (ESI⁻, m/z) calcd for C₄H₄N₇O⁻: 166.0483, found: 166.0488.

2.4 Synthesis of 3-(diazen-1-i um-2-yl)-5-(5-(nitroamino)-1,3,4-oxadiazol-2-yl)-1,2,4-triazol-1-ide (5)

At -10 °C, compound **4** (0.5 g, 3.0 mmol) was added slowly to 4.5 mL fuming HNO₃. The mixture was maintained at this temperature until all the solid was completely dissolved. After that, the clear reaction system was stirred at room temperature for 24 h. The solution was poured into ice water. After standing for a while, compound **5** precipitated from aqueous phase. White solid was collected by filtration to yield **5** (67%). ¹H (400 MHz, DMSO-*d*₆): δ=6.89 ppm; ¹³C (100 MHz, DMSO-*d*₆): δ=161.48, 150.44, 150.18, 135.30 ppm.

2.5 Synthesis of *N*-(5-(nitroamino)-1,3,4-oxadiazol-2-yl)-1*H*-1,2,4-triazol-3-yl)nitramide (6).

At -10 °C, compound **4** (0.5 g, 3.0 mmol) was added slowly to 4.5 mL fuming HNO₃. The mixture was maintained at this temperature until all the solid was completely dissolved. Then, the solution was warmed to 0 °C, and stirred for 7 h. After that, the clear reddish-brown solution was poured into ice water and was extracted by ethyl acetate. The organic phase was washed by brine several times, dried over anhydrous MgSO₄, and evaporated under vacuum to yield **6** (47%). ¹H (400 MHz, DMSO-*d*₆): δ=7.69, 4.23 ppm; ¹³C (100 MHz, DMSO-*d*₆): δ=164.43, 152.76, 148.48, 139.85 ppm. HRMS (ESI⁺, m/z) calcd for C₄H₄N₉O₅⁺: 258.0330, found: 258.0335; HRMS (ESI⁻, m/z) calcd for C₄H₂N₉O₅⁻: 256.0184, found: 256.0181.

2.6 Synthesis of *N*-(5-(3-azido-1*H*-1,2,4-triazol-5-yl)-1,3,4-oxadiazol-2-yl)nitramide (7).

At -10 °C, compound **5** (0.5 g, 2.2 mmol) was suspended in 5.0 mL ethanol. At this temperature, aqueous hydroxylamine (0.15 mL, 50%) was added dropwise to the mixture. Subsequently, the reaction system was stirred at room temperature for overnight. The white precipitate was filtered, washed with cold ethanol, and dried in air to obtain **7** (81%). ¹H (400 MHz, DMSO-*d*₆): δ=7.01 ppm; ¹³C (100 MHz, DMSO-*d*₆): δ=161.56, 154.04, 149.48, 148.84 ppm. HRMS (ESI⁺, m/z) calcd for C₄H₂N₁₀NaO₃⁺: 261.0204, found: 261.0201; HRMS (ESI⁻, m/z) calcd for C₄HN₁₀O₃⁻: 237.0239, found: 237.0244.

2.7 Synthesis of *N*-(5-(3-methoxy-1*H*-1,2,4-triazol-5-yl)-1,3,4-oxadiazol-2-yl)nitramide (8**).**

Compound **5** (0.5 g, 2.2 mmol) was suspended in 15.0 mL methanol. Then the reaction system was stirred at 50 °C for 3 h, and the mixture gradually turned colorless and clear. After the solution cooled, most solvent was removed under vacuum. White product **8** was collected by filtration, washing with a small amount of cold methanol and drying in air (76%). ¹H (400 MHz, DMSO-*d*₆): δ=8.89 ppm; ¹³C (100 MHz, DMSO-*d*₆): δ=161.41, 150.82, 148.12, 146.30, 53.33 ppm. HRMS (ESI⁺, m/z) calcd for C₅H₆N₇O₄⁺: 228.0476, found: 228.0471; HRMS (ESI⁻, m/z) calcd for C₅H₄N₇O₄⁻: 226.0330, found: 226.0334.

5. Crystal Structure Data

Single crystal X-ray diffraction (XRD) data were collected with synchrotron radiation at the Beamline I711, MAX IV Laboratory, Lund, Sweden. Data reduction and empirical absorption correction were applied with CrysAlisPro, and the structure was solved and refined by SHELXS and SHELXL-97. All non-hydrogen atoms were located from the single crystal X-ray diffraction data. Crystallographic details of the structure refinement of four crystals in this work are given in Table S1-S16. The atomic coordinates and equivalent isotropic displacement parameters can be found in the cif file.

7. Theoretical Calculation

Theoretical calculations of enthalpies of formation were carried out by using the Gaussian 09 (Revision D.01) suite of programs [S10]. The gas-phase enthalpies of formation of compounds **5–8** were obtained by using the CBS-QB3 and isodesmic reactions. The solid-state enthalpy of formation for a neutral compound can be estimated by subtracting the enthalpy of sublimation from gas-phase enthalpy of formation. According to the previous literature [S11], the enthalpy of sublimation can be estimated with Trouton's rule according to supplementary equation (1), where T represents either the melting point or the decomposition temperature when no melting occurs prior to decomposition:

$$\Delta H_{\text{sub}} = 0.188 \text{ } kJ \cdot mol^{-1} \cdot K^{-1} \times T \quad (1)$$

The optimization of molecular structures is achieved by b3lyp/6-31+G** em=gd3bj. And the calculation of single point energy is based on B3LYP-D3(BJ)/ma-TZVPP.

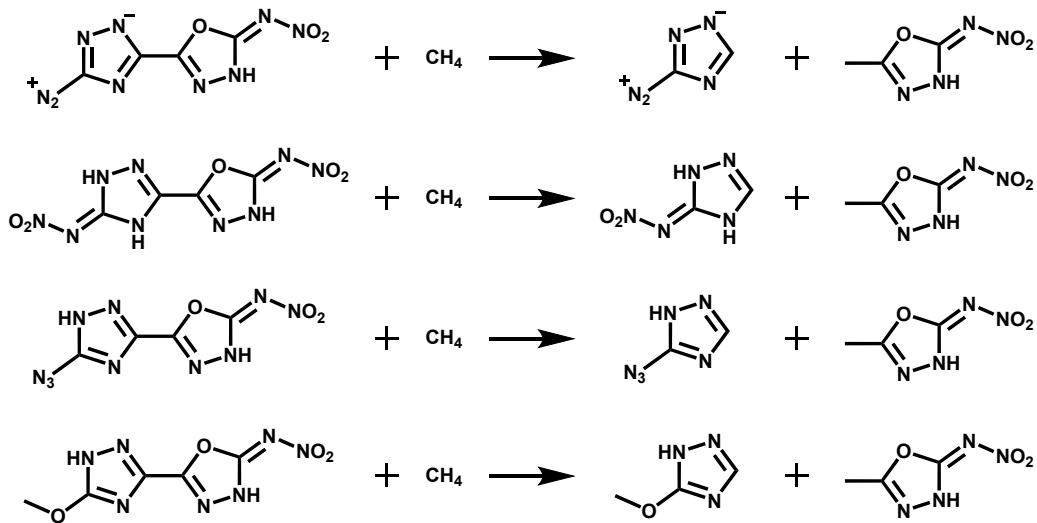

Figure S28. Isodesmic reactions of compounds **5–8**.
