#### Average crystallite size by using Debye-Scherrer equation

The crystallite size of the crystalline materials was estimated from X-ray diffraction patterns using the Debye-Scherrer equation.

$$D = K\lambda / \beta \cos\theta$$

The Scherrer constant (K) was taken as 0.89, and the wavelength ( $\lambda$ ) of the X-ray was determined by the X-ray source, which was Cu K $\alpha$  radiation with a wavelength of 1.5406 Å. The FWHM ( $\beta$ ) in radians was measured by determining the diffraction peak width at half of its maximum intensity, and the Bragg angle ( $\theta$ ) was obtained from the XRD pattern by locating the position of the diffraction peak.
