**Achieving High-Capacity Sodium Insertion of Coal-based Hard Carbon Anodes  
via Closed-Pore Modification**

**Figure S1** TG curves of HC and SHC-750

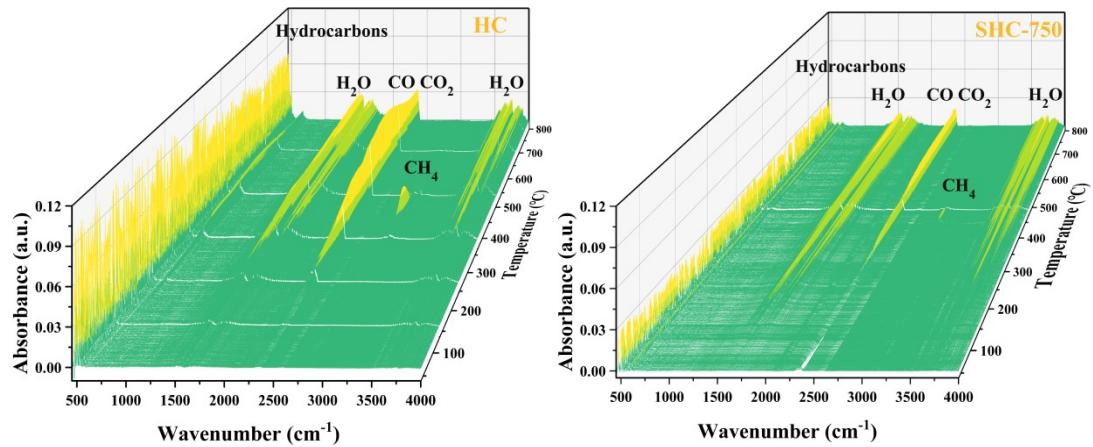

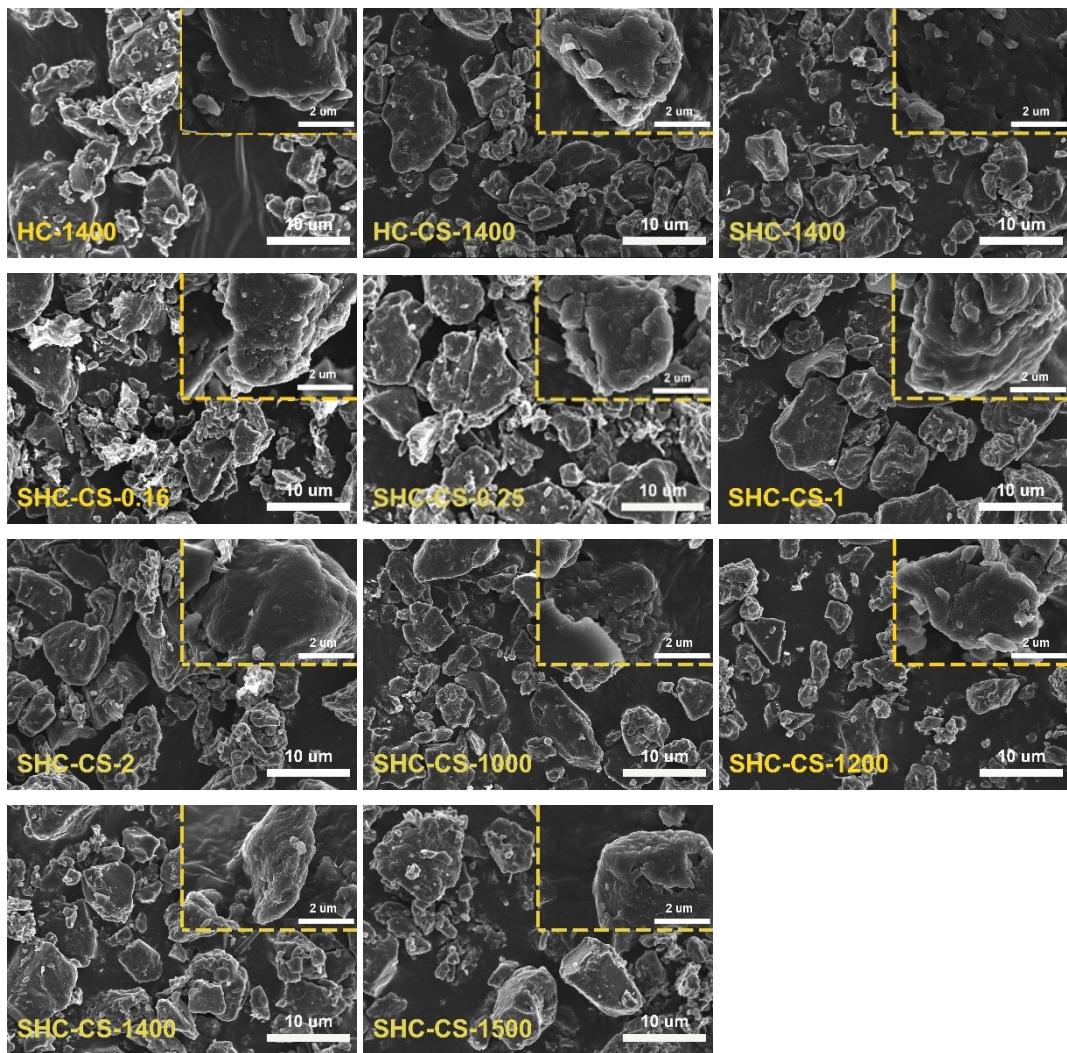

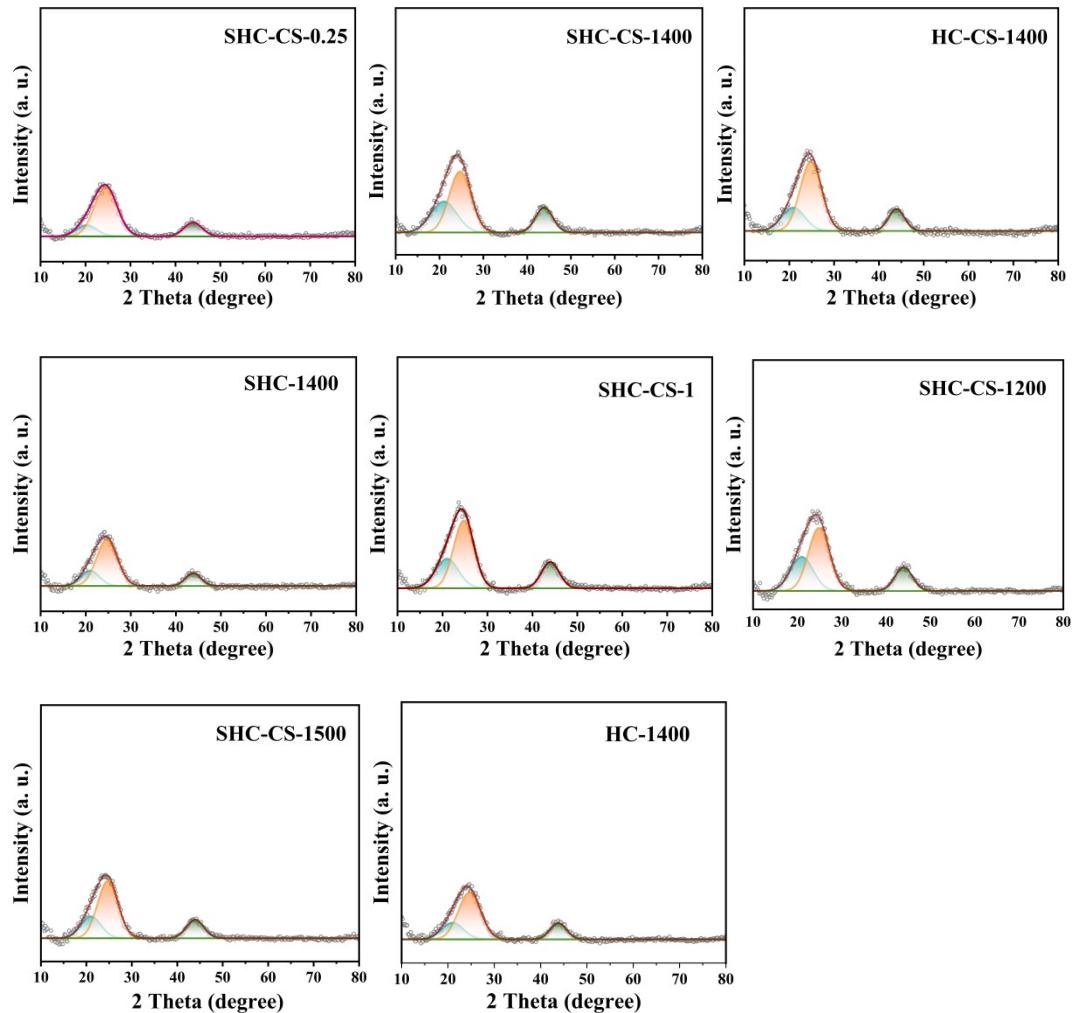

Figure S2 (a)HC, (b)SHC-750 的 TG-FTIR spectrum

**Figure S3** The SEM images of HC samples. SEM images of (a) HC-1400, (b) HC-CS-1400, (c) SHC-1400, (d) SHC-CS-0.16, (e) SHC-CS-0.25, (f) SHC-CS-1, (g) SHC-CS-2, (h) SHC-CS-1000, (i) SHC-CS-1200, (j) SHC-CS-1400and (k) SHC-CS-1500 samples.

**Figure S4** The fitting results of XRD patterns of (a) SHC-CS-0.25, (b) SHC-CS-1400, (c) HC-CS-1400, (d) SHC-1400, (e) SHC-CS-1, (f) SHC-CS-1200, (g) SHC-CS-1500 and (h) HC-1400 samples.

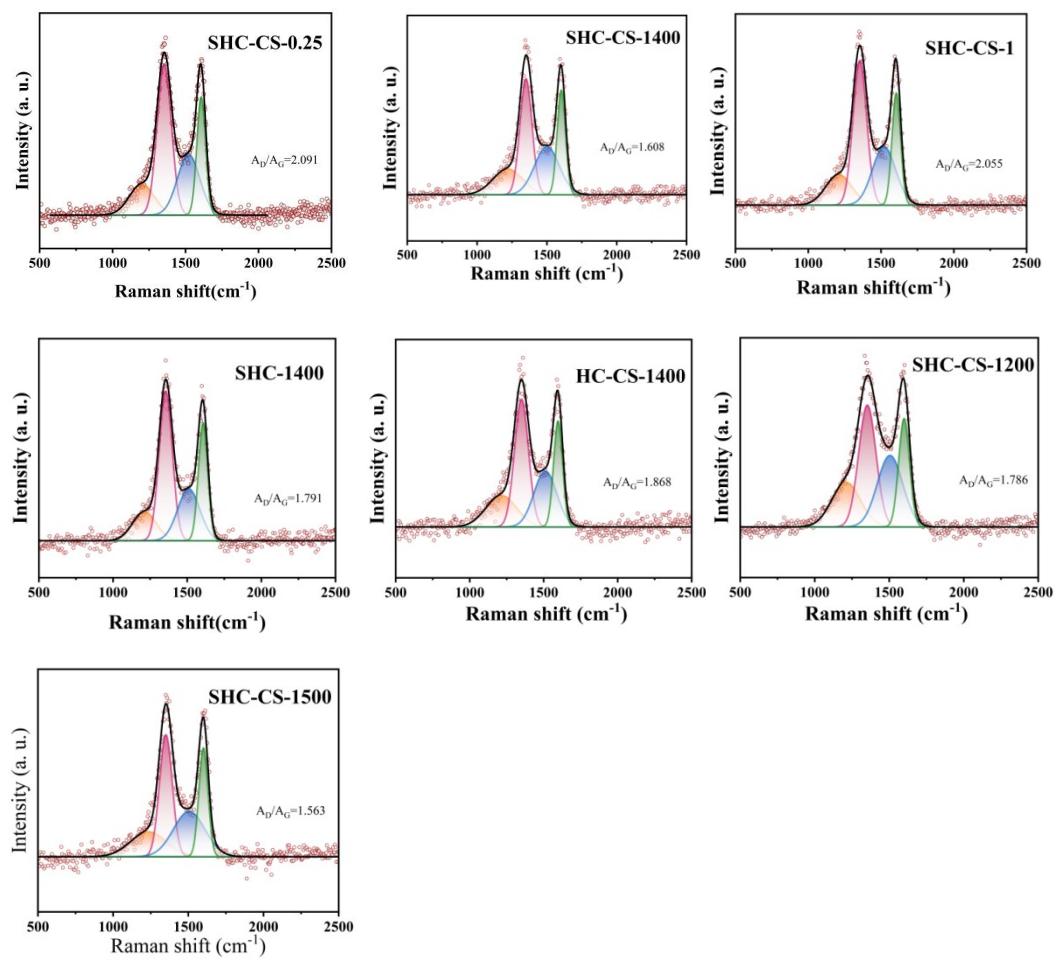

$$d = \frac{\lambda}{2 \times \sin(\theta_{002})}$$

Where  $\lambda$  is the wavelength of the X-rays (0.154178 nm),  $2\theta_{002}$  is the peak position of (002) peak in the XRD pattern.  $K_{Cu} = 0.15406$  nm.

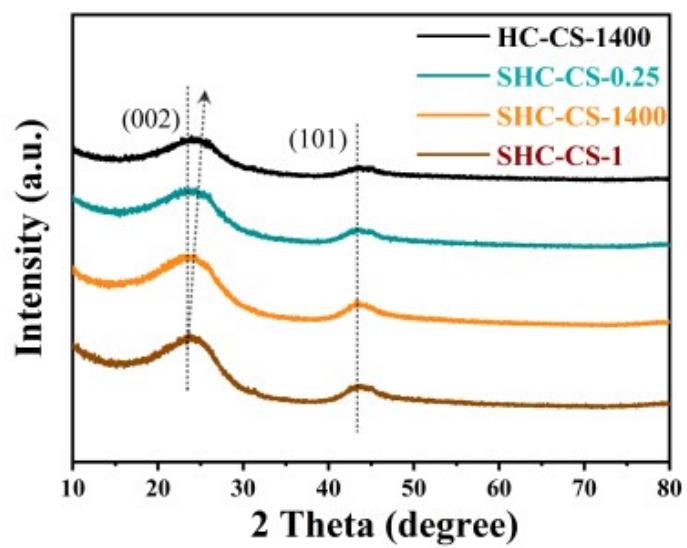

$$La = 1.84\lambda/B_{100}\cos\theta_{100}$$

$$Lc = 0.89\lambda/B_{002}\cos\theta_{002}$$

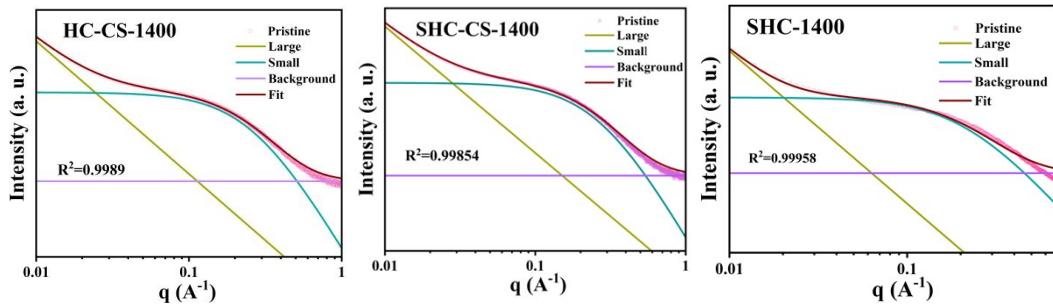

Where  $\lambda$  is the wavelength of the X-rays (0.154178 nm),  $B_{100}$  and  $B_{002}$  are the full width at half maxima of the (100) and (002) peaks,  $2\theta_{100}$  and  $2\theta_{002}$  are the corresponding peak positions.

**Figure S5** The fitting results of Raman spectra of (a) SHC-CS-0.25, (b) SHC-CS-1400, (c) SHC-CS-1, (d) SHC-1400, (e) HC-CS-1400, (f) SHC-CS-1200, and (g) SHC-CS-1500 samples.

**Figure S6** XRD patterns of HC samples with different CS ratios.

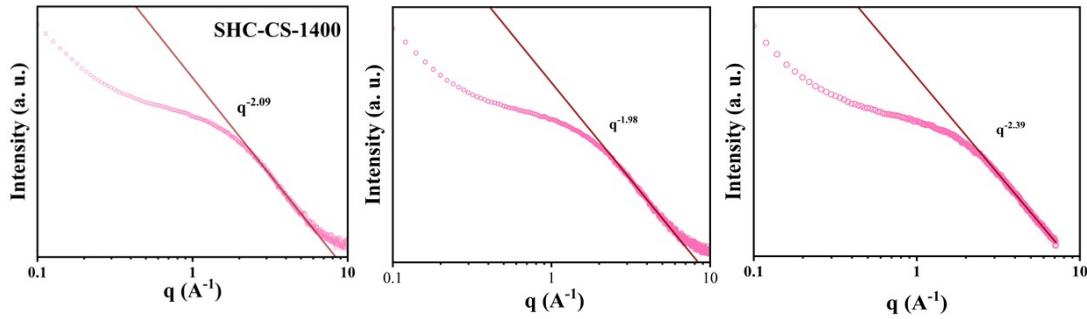

**Figure S7** Fitted SXAS patterns of HC samples.

The scattered intensity from a medium containing nanopores together with macropores can be represented by the function:

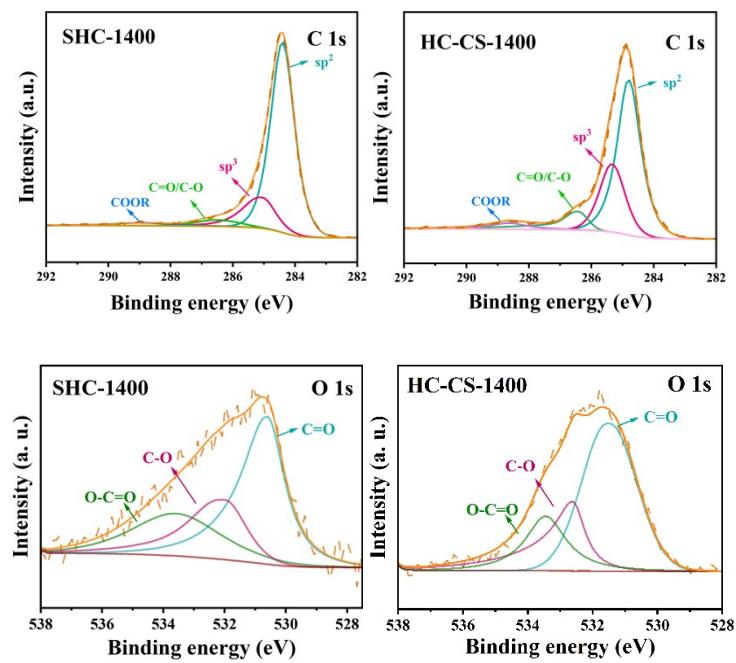

$$I(q) = \frac{A}{q^a} + \frac{B a_1^4}{(1 + a_1^2 q^2)^2} + D$$

Where  $q$  is the wavevector,  $A$  and  $B$  are proportional to the total surface areas of the large and small pores, and  $D$  is a constant background term. the radius of a spherical pore equivalent to Debye's length, is  $R = a_1 \sqrt{10}$

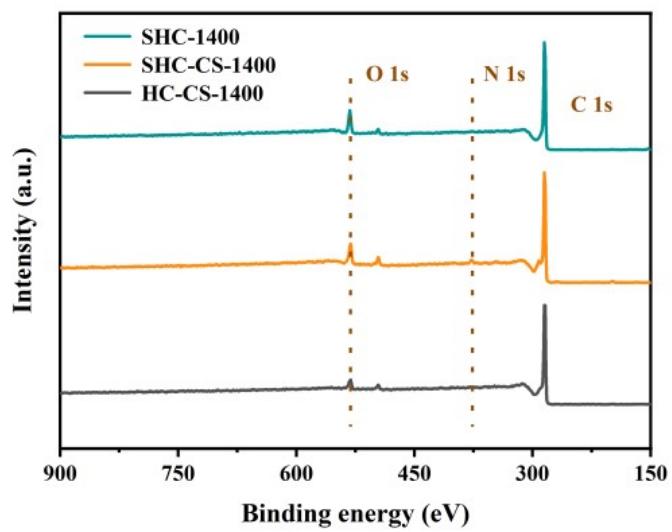

**Figure S8** Porod fitted SXAS patterns of HC samples.

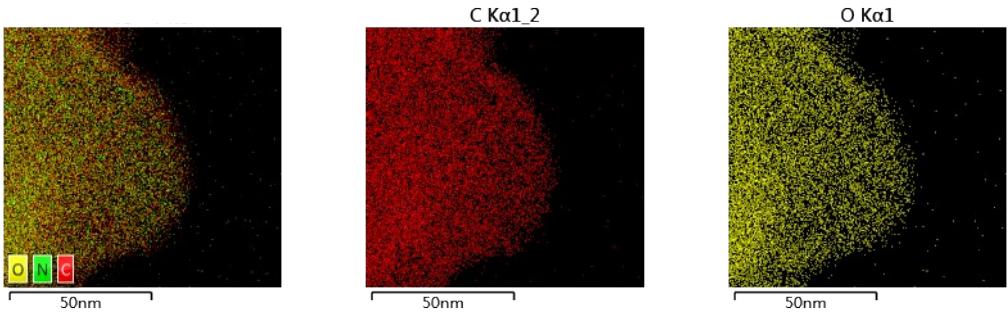

A power law fit in this region of the scattering curve,  $I(q)=A*q^{-n}$  ( $q = 3\sim6 \text{ nm}^{-1}$ ), is applied to access pore surface and surface roughness.  $A$  is the Pollard constant proportional to the inner surface and  $n$  is the power exponent. The  $n$  is related to the surface roughness of the nanopore. A larger value indicates a smoother surface.

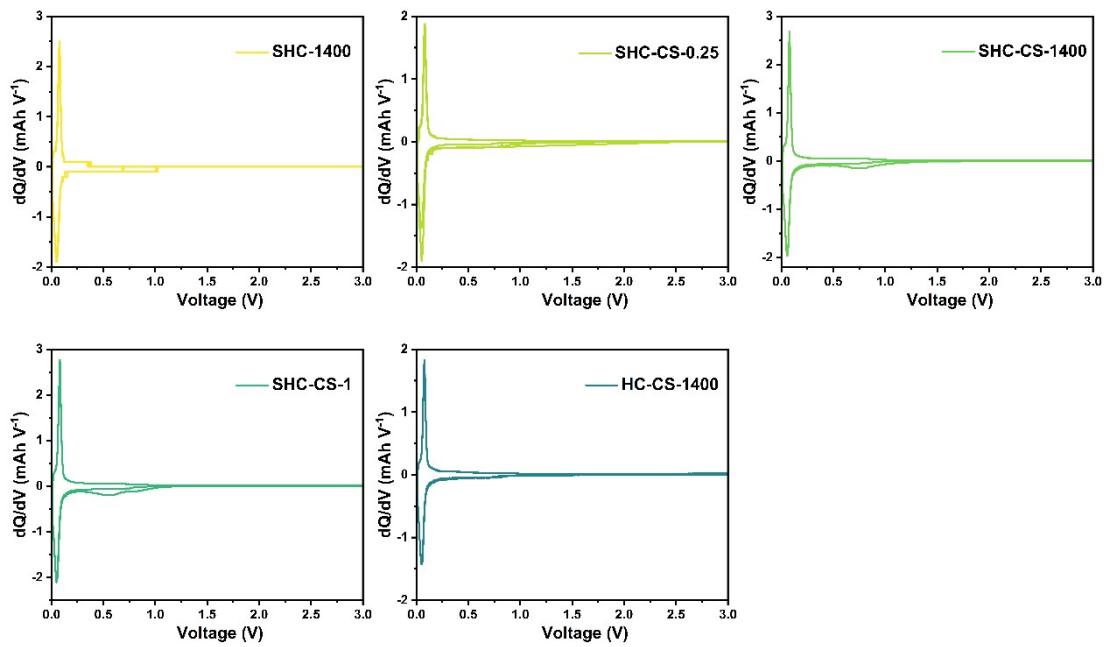

**Figure S9** The high-resolution C 1s XPS spectra of (a) SHC-1400, (b) HC-CS-1400; The high-resolution O 1s XPS spectra of (c) SHC-1400 (d) HC-CS-1400.

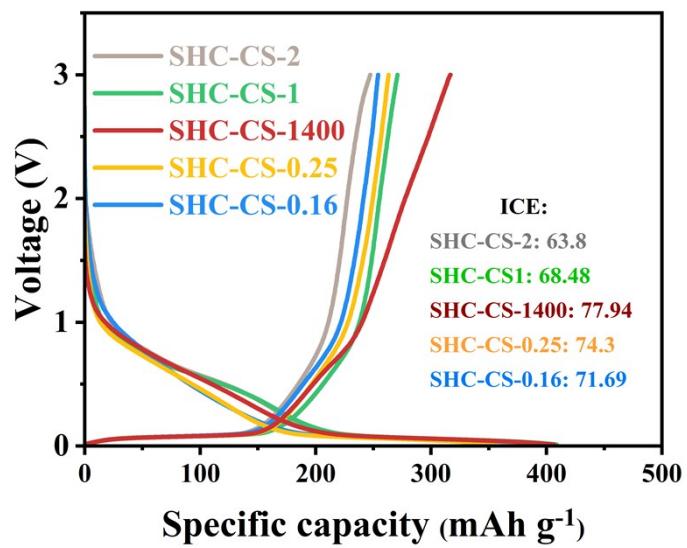

**Figure S10** XPS full spectrum of HC samples: SHC-1400, SHC-CS-1400, HC-CS-1400.

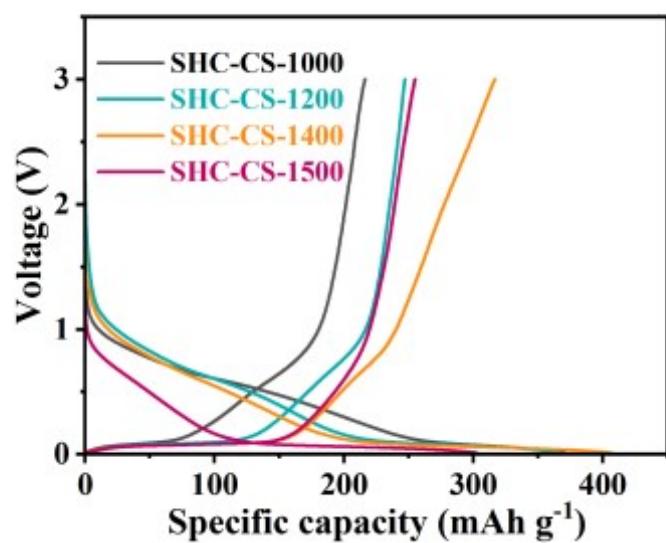

**Figure S11** EDS of SHC-CS-1400

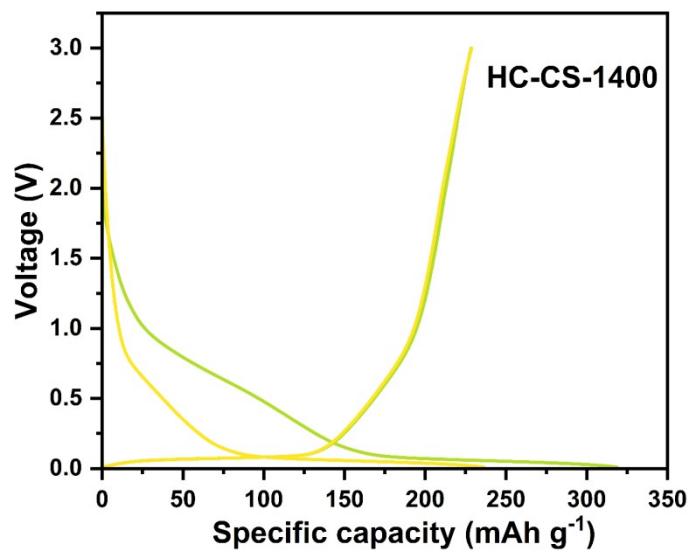

**Figure S12** The dQ/dV curves of HC samples.

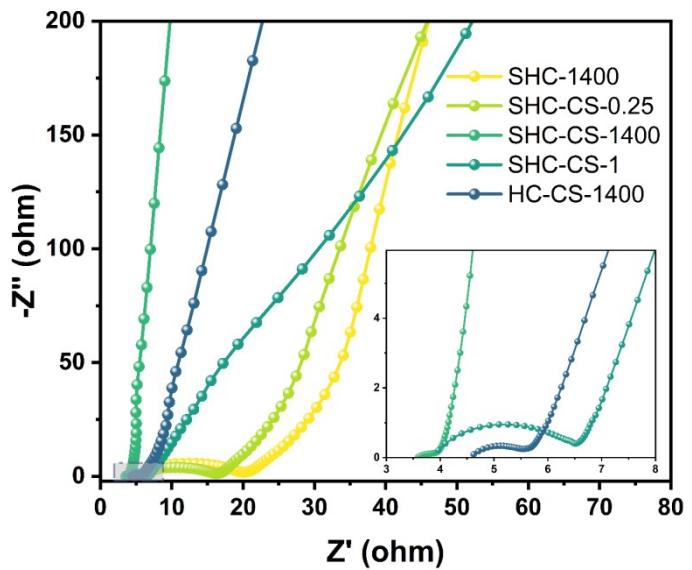

**Figure S13** GCD curves of SHC-CS-2, SHC-CS-1, SHC-CS-1400, SHC-CS-0.25, SHC-CS-0.16.
