SUPPORTING TABLES

Table S1. TEM size, Hydrodynamic size, and ζ -potential for AgNPs and PpIX-AgNPs in DPBS (1 mM).

Sample Name	TEM size (n= 150)	Hydrodynamic	ζ-potential	
	(nm)	Size (nm)	(mV)	
AgNP	42.2 ± 7.8	37.8 ± 0.3	-47.1 ± 3.6	
PpIX-AgNP	42.2 ± 8.9	64.1 ± 0.6	-56.7 ± 3.0	

Table S2. Summary of ζ -potential for PpIX-AgNPs in various culture media and DPBS at 0 and 24 hours.

Sample Name	0 hour	24 hours
DPBS (1 mM)	-38.4 ± 0.8 mV	-34.4 ± 4.1
DPBS (10 mM)	-21.4 ± 1.5 mV	-24.1 ± 1.8
NB	-17.8 ± 0.4 mV	-19.1 ± 0.7
TSB	-23.1 ± 1.8 mV	-21.1 ± 1.0
LB	-18.7 ± 1.3 mV	-16.5 ± 1.3

Table S3. Composition of bacterial culture media, adjusted to 1.0 L solution.

Ingredients	NB	Tryptic Soy Broth	Luria Broth	DPBS
Glucose	1 gram	2.5 grams	-	-
Peptone	15 grams	-	-	-
Sodium Chloride	6 grams	5 grams	10 grams	8 grams
Yeast Extract	3 grams	-	5 grams	-
Tryptone (SELECT)	-	17 grams	10 grams	-
Soytone (Soybean)	-	3 grams	-	-
Dipotassium Phosphate	-	2.5 grams	-	0.2 grams
Potassium chloride	-	-	-	0.2 grams
Sodium Phosphate (dibasic)	-	-	-	1.15 grams
Extra components such pH adjuster	рН 7.5 ± 0.2	рН 7.3 ± 0.2	рН 7.0; NaOH	

Table S4. Salt and protein content (in w/v %) in varying media conditions. The % of protein content includes peptone, tryptone, soytone, and yeast extract. In the case of % of the salt content includes sodium chloride, dipotassium phosphate, and potassium chloride.

<u>Culture</u>	<u>w/v % of</u>	<u>w/v % of</u>
<u>media</u>	<u>salt</u>	<u>protein</u>
DPBS	0.95	0.0
NB	0.60	1.8
TSB	0.80	2.0
LB	1.00	1.5

Table S5. ICP-OES digestion results in varying concentrations of PpIX-AgNPs.

Sample Name	Total Ag⁺ amount (μg/L)	
	Average	Std Dev
1.5 PpIX-AgNPs	2749.92	45.91
1.0 PpIX-AgNPs	1786.24	195.93
0.5 PpIX-AgNPs	931.56	25.98

Table S6. Kinetic release rates for dual-step irradiation of varying PpIX-AgNP concentration.

Media	Phase	Slope	R2
1.5 ug/mL	Burst_1	21.50	1.00
	Burst_2	7.58	0.95
1.0 ug/mL	Burst_1	18.68	0.99
	Burst_2	9.87	1.00
0.5 ug/mL	Burst_1	12.31	0.99
	Burst_2	7.20	0.98

Table S7. Kinetic release rates for single irradiation in varying culture media.

Media	Phase	Slope	R ²
Water	Burst	8.26	0.99
	Steady	0.02	0.90
DPBS	Burst	23.66	0.97
	Steady	0.07	0.98
NB	Burst	17.83	0.99
	Steady	0.06	0.98
TSB	Burst	12.34	0.98
	Steady	0.14	0.89
LB	Burst	22.21	0.98
	Steady	0.39	0.99

Table S8. Kinetic release rates for DIR irradiation in varying culture media.

Media	Phase	Slope	R ²
Water	Burst_1	4.13	0.92
	Burst_2	3.55	1.00
DPBS	Burst_1	9.93	1.00
	Burst_2	6.61	0.82
NB	Burst_1	12.59	0.98
	Burst_2	7.79	0.94
TSB	Burst_1	7.77	1.00
	Burst_2	6.25	0.99
LB	Burst_1	10.64	1.00
	Burst_2	7.79	0.94

SUPPORTING SCHEMES

Scheme S1. Schematic demonstrating the multi-step irradiation setup (MIS) employed for Ag⁺ release and bacterial inactivation experiments.

Determination of number of PpIX molecules per silver nanoparticles (AgNP)

By assuming that AgNPs are spherical in shape, the mass of each nanoparticle (m_{AgNP}) was calculated based on average diameter determined from TEM and density value of 8.578 g/mL obtained from Tadjiki et al [¹]. The number of PpIX molecules per nanoparticle of 241,831 was calculated using the Equation (3).

Equation 3

$$PpIX molecules per AgNP = \frac{m_{AgNP} x Mf_{(PpIX:AgNP)} x N_a}{MW_{cysPpIX}}$$

Where, m_{AgNP} is the mass of each AgNP, Mf is mass fraction PpIX:AgNP (0.448:0.552) for PpIX-AgNP, N_a is the Avogadro's constant and MW_{cysPpIX} is the molecular weight of cysPpIX.

SUPPORTING FIGURES

Figure S1. UV-Vis (DMF), FT-IR, MALDI-MS spectra for PpIX (black), sePpIX (red) and cysPpIX (blue). Expected m/z: [PpIX]+ = 562.66 / Observed: m/z: [PpIX+1]+ = 563.22; Expected m/z: [sePpIX]+ = 756.84/Observed: m/z: [sePpIX+1]+ = 757.73; Expected m/z: [cysPpIX]+ = 680.93/ Observed: m/z: [cysPpIX-2]+ = 678.76.
