[ML ₂]	8.2	10.5 ± 0.2	–

[a] Charges of the complexes are omitted for clarity. L^{2-} is doubly negative. [b] Formation constants for Fe(III) complexes taken from Ref. S11 [c] Data were evaluated at $\text{pH} < 4$. [d] Data were evaluated at $\text{pH} < 7$.

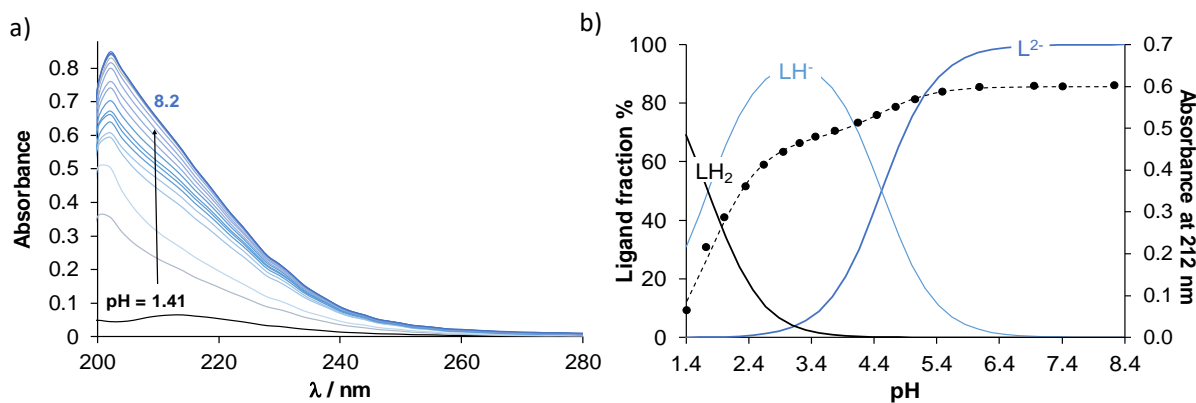

Figure S2. (a) UV-vis absorption spectra recorded for 2-OG in the pH range 1.4 – 8.2 (b) Concentration distribution curves calculated with the pK_a values obtained by UV-vis titrations, and absorbance changes at 212 nm (●) at various pH values with the fitted curve (dashed line). $\{c_{\text{IOX1}} = 300 \mu\text{M}; \ell = 1 \text{ cm}; I = 0.1 \text{ M (KCl)}; T = 25.0 \text{ }^\circ\text{C}\}$

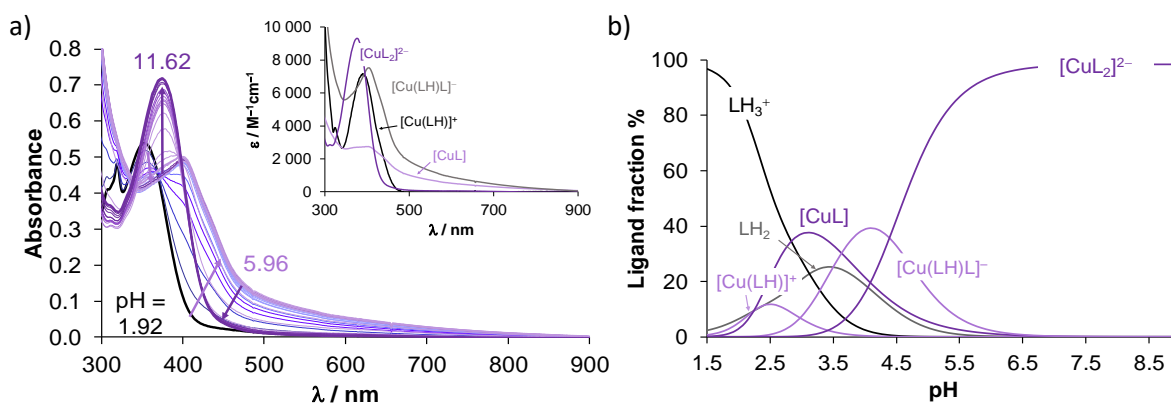

Figure S3. (a) UV-vis absorption spectra recorded for the Cu(II) – IOX1 (1:2) system in the pH range 2.1 – 11.6, the inserted figure shows the calculated UV-vis molar absorption spectra of the various complexes (b) Concentration distribution curves calculated for the same system. $\{c_{\text{IOX1}} = 161 \mu\text{M}; c_{\text{Cu(II)}} = 80 \mu\text{M}; \ell = 1 \text{ cm}; I = 0.1 \text{ M (KCl)}; T = 25.0 \text{ }^\circ\text{C}\}$

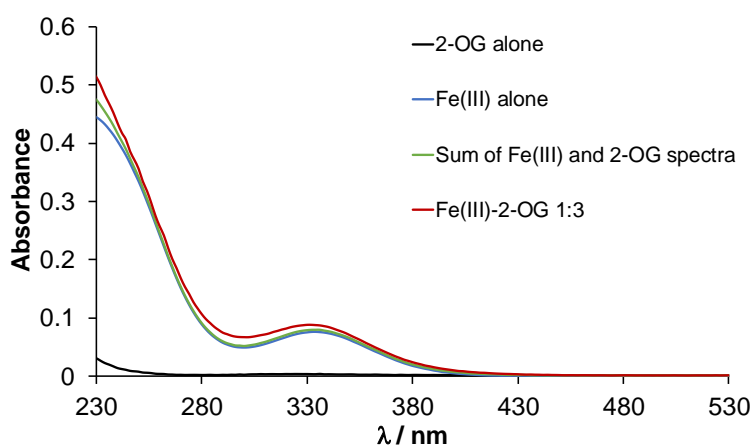

Figure S4. UV-vis absorption spectra recorded for 2-OG alone (black), Fe(III) alone (blue), sum of 2-OG and Fe(III) (green), and Fe(III) – 2-OG 1:3 system (red) at pH 1.40. $\{c_{2\text{-OG}} = 300 \mu\text{M}; c_{\text{Fe(III)}} = 100 \mu\text{M}; \ell = 1 \text{ cm}; I = 0.1 \text{ M (KCl)}; T = 25.0 \text{ }^\circ\text{C}\}$

Figure S5. Cyclic voltammogram of the Fe(III) – 2-OG (1:3) system. $\{c_{2\text{-OG}} = 1.5 \text{ mM}; c_{\text{Fe(III)}} = 0.5 \text{ mM}; \text{pH} = 3.00; 60\% \text{ (v/v) DMF/H}_2\text{O}; \text{scan rate: } 10 \text{ mV/s}; I = 0.1 \text{ M (KNO}_3\text{)}; T = 25.0 \text{ }^\circ\text{C}\}$

Figure S6. ESI-MS spectrum of $[\text{RhCp}^*(\text{LH})(\text{H}_2\text{O})]$ complex, m/z values for $[\text{RhCp}^*(\text{LH})]^+$ ($\text{C}_{20}\text{H}_{21}\text{NO}_3\text{Rh}$): calculated: 426.0576, found: 426.0550. $\{\text{C}_{\text{complex}} = 200 \mu\text{M}; \text{pH} = 7.4 (\text{NH}_4\text{HCO}_3)\}$

Figure S7. ^1H NMR spectrum of $[\text{RhCp}^*(\text{LH})\text{Cl}]$ complex in $\text{DMSO-}d_6$. Numbering in the chemical structure corresponds to the labeled NMR peaks. $\{\text{C}_{\text{complex}} = 10 \text{ mM}, T = 25.0 \text{ }^\circ\text{C}\}$

Figure S8. ^{13}C APT NMR spectrum of $[\text{RhCp}^*(\text{LH})\text{Cl}]$ complex in $\text{DMSO-}d_6$. Attached proton test method: CH and CH_3 peaks are positive, C and CH_2 peaks are negative. Numbering in the chemical structure corresponds to the labeled NMR peaks. $\{c_{\text{Complex}} = 10 \text{ mM}, T = 25.0 \text{ }^\circ\text{C}\}$

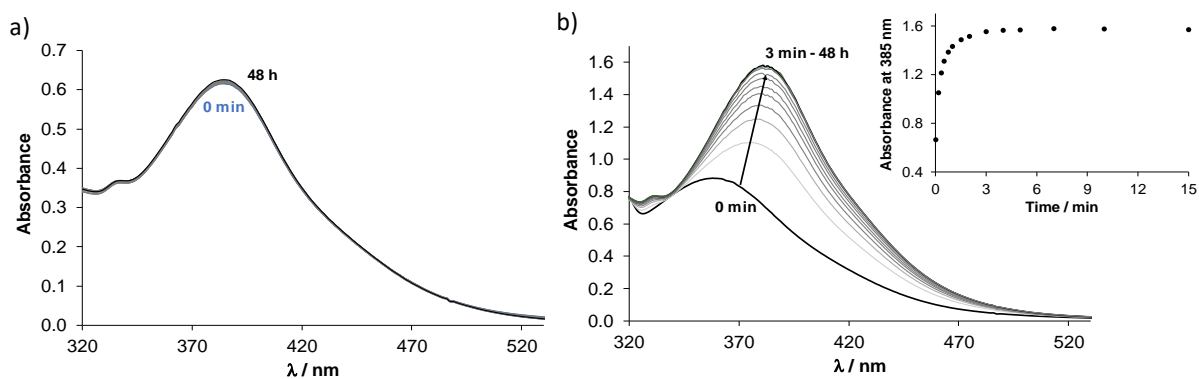

Figure S9. (a) UV-vis spectra of the isolated $[\text{RhCp}^*(\text{LH})\text{Cl}]$ complex dissolved in PBS' at pH 7.4 recorded after 1 min (blue solid lines) and after 48 h (black solid lines), and (b) UV-vis spectra of $[\text{RhCp}^*(\text{H}_2\text{O})_3]^{2+} - \text{IOX1}$ (1:1) chemical system at pH 2.00 (0.01M KNO_3) at different time point. $\{(a) c_{\text{Complex}} = 100 \text{ } \mu\text{M}; (b) c_{\text{RhCp}^*} = c_{\text{IOX1}} = 200 \text{ } \mu\text{M}; l = 0.2 \text{ M (KNO}_3); l = 1 \text{ cm}; T = 25.0 \text{ }^\circ\text{C}\}$

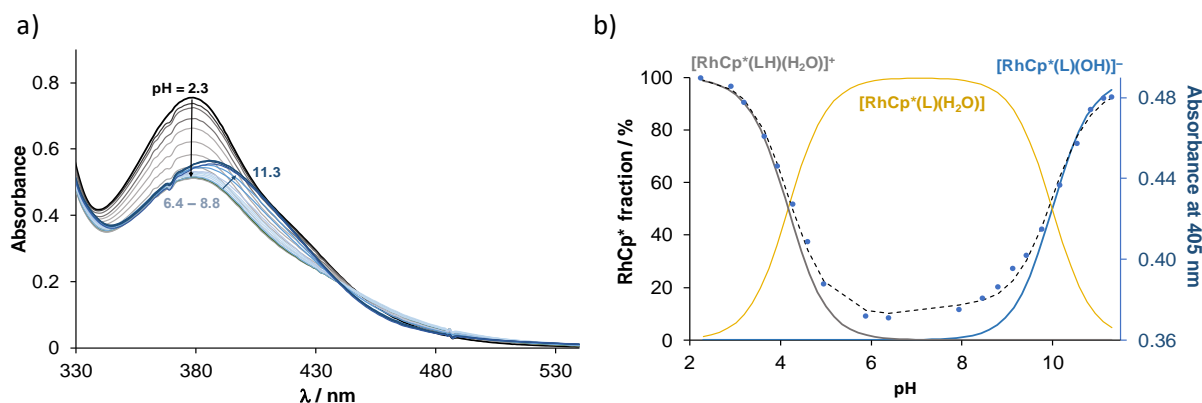

Figure S10. (a) UV-vis absorption spectra recorded for the [RhCp*(H₂O)₃]²⁺ – IOX1 (1:1) chemical system in the pH range 2.3 – 11.3. (b) Concentration distribution curves calculated for the same system based on the obtained pK_a values, and absorbance values at 405 nm at various pH values with the fitted curve (dashed line). {c_{RhCp*} = c_{IOX1} = 80 μM; ℓ = 1 cm; I = 0.2 M (KNO₃); T = 25.0 °C}

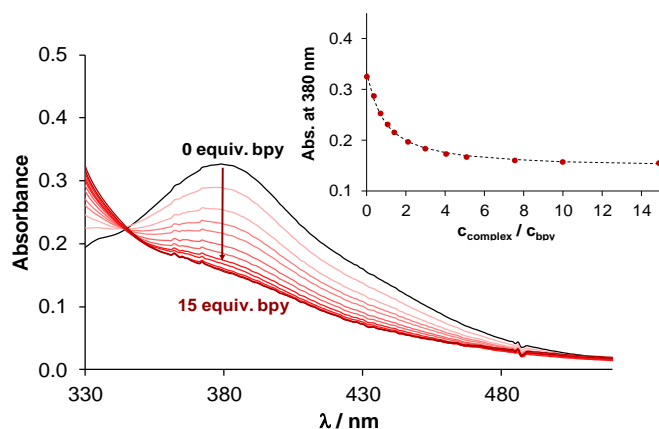

Figure S11. UV-vis spectra of RhCp* – IOX1 – bpy system at various bpy-to-complex ratios, and the inserted figure shows the absorbance values at 380 nm at various ratios with the fitted curve (dashed line). {c_{RhCp*} = c_{IOX1} = 50 μM; c_{bpy} = 0 – 745 μM; ℓ = 1 cm; pH = 7.4 (20 mM phosphate buffer); I = 0.2 M (KNO₃); T = 25.0 °C}

Figure S12. UV-vis spectra of RhCp* – IOX1 complex at pH 7.40 measured at various chloride ion concentrations, and the inserted figure shows the absorbance values at 400 nm at various chloride ion concentrations with the fitted curve (dashed line). {c_{complex} = 80 μM; c_{KCl} = 0 – 0.33 M; ℓ = 1 cm; pH = 7.4 (20 mM phosphate buffer); T = 25.0 °C}

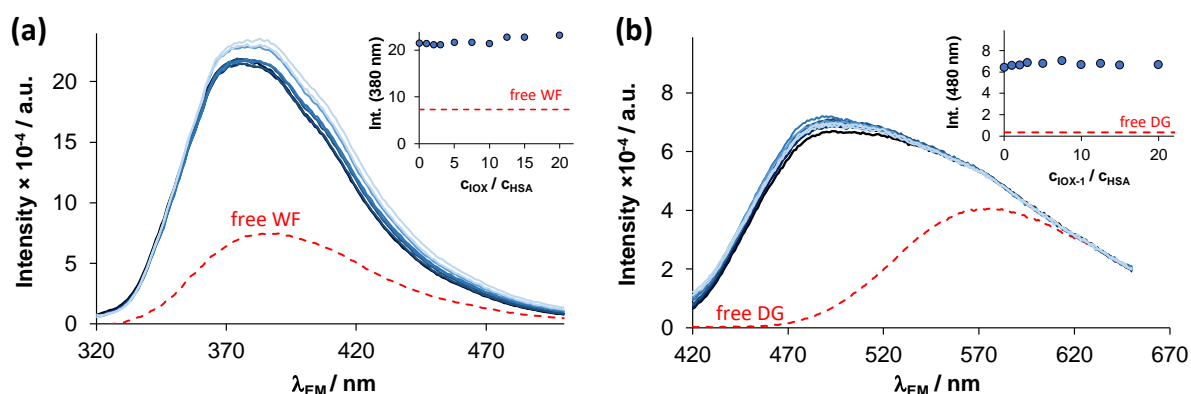

Figure S13. Fluorescence spectra recorded for the HSA – WF (a) and HSA – DG (b) systems in the presence of increasing IOX1 concentrations. The inserted figures show the intensities at the indicated λ_{EM} as a function of IOX1-to-HSA ratios. Dashed spectra denote the emission spectra of free site markers; IOX1 is non-fluorescent under the applied conditions. $\{C_{HSA} = C_{site\ marker} = 1\ \mu\text{M}; C_{IOX1} = 0\text{--}20\ \mu\text{M}; \lambda_{EX} = 310\ \text{nm}\ (\text{WF}), 335\ \text{nm}\ (\text{DG}); \text{pH} = 7.40\ (\text{PBS}'\ \text{with}\ 2\ \text{mM}\ \text{EDTA}); T = 25\ ^\circ\text{C}\}$

Table S2. Initial composition of the samples prepared for equilibrium dialysis experiments, equilibrium concentrations, and free compound fractions obtained after the equilibrium was reached. UV-vis spectroscopy and Solver add-in of MS Excel were applied to determine free marker and IOX1 concentrations in the acceptor phase. $\{\text{pH} = 7.40\ (\text{PBS}'\ \text{with}\ 2\ \text{mM}\ \text{EDTA}), T = 25\ ^\circ\text{C}\}$

Table S8. Collection of hydrolysis constants of Fe(III) and Fe(II). ^a {I = 0; T = 25 °C}

$\log\beta$	Fe(III)	Fe(II)
[MH ₋₁]	-2.2	-9.43
[MH ₋₂]	-5.71	-20.73
[MH ₋₃]	-12.26	-32.68
[MH ₋₄]	-21.6	–
[M ₂ H ₋₂]	-2.91	–

^a Data taken from Ref. SI2.

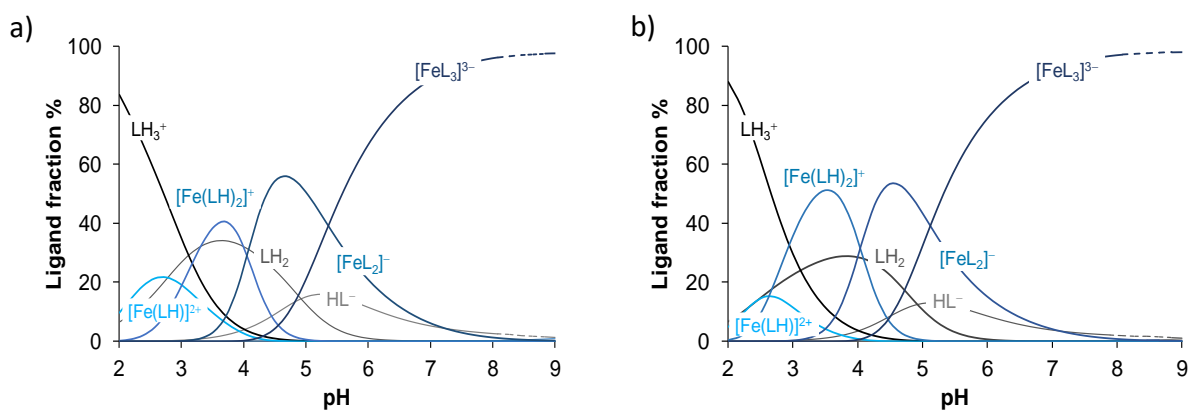

Figure S22. Concentration distribution curves calculated for Fe(III) – IOX1 (1:3) systems with hydrolysis constants for (a) $I = 0.1$ KNO₃ ($\log\beta$ for $[MH_{-1}] = -2.56$, $[MH_{-2}] = -5.9$, $[M_2H_{-2}] = -2.88$) (b) $I = 1.0$ KCl ($\log\beta$ for $[MH_{-1}] = -3.21$, $[MH_{-2}] = -6.73$, $[M_2H_{-2}] = -4.09$, $[M_3H_{-4}] = -7.58$). Hydrolysis constants were taken from Ref. S12. $\{C_{IOX1} = 161 \mu\text{M}, C_{Fe(III)} = 53 \mu\text{M}\}$

Table S9. Conditions applied for steady-state spectrofluorometric measurements.

	C_{HSA} (μM)	C_{MARKER} (μM)	C_{IOX1} (μM)	λ_{EX} (nm)	λ_{EM} (nm)	slit widths EX/EM (nm/nm)
Trp214 quenching	1	–	0–60	295	310-500	4/4
WF displacement	1	1	0–20	310	320-500	4/4
DG displacement	1	1	0–20	335	420-600	5/5

CALCULATIONS APPLIED FOR THE EQUILIBRIUM DIALYSIS ASSAYS

Equilibrium dialysis assays were executed according to the following protocol: two parallel samples were always prepared.

Recovery of the compounds was determined by dialyzing samples containing the compounds only, and it is defined as follows:

$$\{n_{\text{acceptor equilibrated}} + n_{\text{donor equilibrated}}\} / n_{\text{initial}};$$

where n = amount of substance. The equilibrium concentrations were determined by measuring the UV-vis absorbance spectrum in the acceptor and donor phases after equilibration and compared to that of the original (initial) sample. The recoveries of IOX1, WF, and DG are: 96%, 99% and 103%, respectively. Although 102% recovery is chemically meaningless, we did not correct the value to 100%. This error is a good indicator of the uncertainty of the method.

In the case of IOX1, it was also possible to determine the recovery of the compound directly in samples containing HSA, as the UV absorption of the compound is not sensitive to HSA binding, so it is sufficient to deconvolute the measured spectrum into the sum of the IOX1 and HSA spectra (see Figure S23a), the recovery of IOX1 in HSA – IOX1 samples was 98%.

Verifying the equilibration between the two compartments: according to the principle of equilibrium dialysis, the free compound (comp.) concentration must be the same in the acceptor and donor phases after equilibration ($[\text{comp.}]_{\text{acceptor}} = [\text{comp.}]_{\text{donor}}$). The validity of this condition was verified with samples containing the compounds only. Absorption spectra recorded for the donor and acceptor phases were nearly the same (Figure S23b)

Equilibrium concentrations listed in Table S2: In the binary systems, free compound concentration in the acceptor phase ($[\text{comp.}]_{\text{acceptor}}$) was determined on the basis of UV-vis absorption spectra, which is equal to $[\text{comp.}]_{\text{donor}}$. In ternary samples, the measured spectrum was deconvoluted to the sum of IOX1 and the site marker spectra (Figure S23c). HSA-bound compound concentrations are calculated as:

$$[\text{comp.}]_{\text{donor}} = (C_{\text{total}} \times V_{\text{donor}} - [\text{comp.}]_{\text{donor}} \times V_{\text{donor}} - [\text{comp.}]_{\text{acceptor}} \times V_{\text{acceptor}}) / V_{\text{donor}}$$

Free compound fractions: for this calculation, the equilibrium concentrations determined in the donor phase are considered only, since these concentrations express the strength of interaction with albumin. The formula used is shown in Table S2.

Figure S23. (a) Spectral deconvolution of a HSA – IOX1 donor phase sample UV-vis spectrum. (b) UV-vis spectra recorded in the donor and acceptor phases after equilibration of a WF sample; dashed spectrum denotes the “expected” spectrum when the original donor phase WF solution is distributed equivalently between both phases. (c) Spectral deconvolution of a HSA – WF – IOX1 acceptor phase sample spectrum into WF and IOX1 spectra.

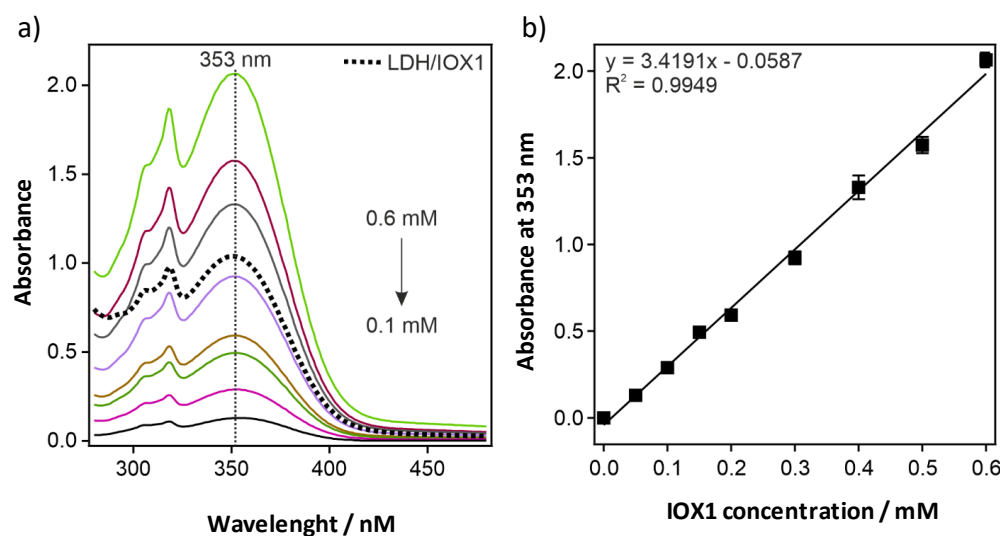

Figure S24. (a) UV-vis spectra of IOX1 in the 0.1 – 0.6 mM concentration range and LDH/IOX1 dissolved in HCl. (a) Calibration curve based on the absorbance values measured at 353 nm.
